Reader's Guide

The Reader's Guide for the *Encyclopedia of Death and the Human Experience* is provided to assist readers in locating entries on related topics. It organizes entries into 16 general topical categories: (1) Conceptualization of Death, Dying, and the Human Experience; (2) Arts, Media, and Popular Culture; (3) Causes of Death; (4) Coping With Loss and Grief; (5) Cross-Cultural Perspectives; (6) Developmental and Demographic Perspectives; (7) Disposition of the Deceased; (8) Funerals and Death-Related Activities; (9) Legal Matters; (10) Mass Death; (11) Process of Dying; (12) Religion; (13) Rituals, Ceremonies, and Celebrations; (14) Suicide, Euthanasia, and Homicide; (15) Theories and Concepts; and (16) Unworldly Entities and Events. From conceptualization of death and dying to the effects these phenomena have on those who survive, the more than 300 entries represent a range of insightful interdisciplinary topics crafted by international scholars and practitioners. Each topic is intended to provide the reader with insights into the phenomena that influence the social meanings of death and dying as these are created through the institutions that structure and organize the cultural artifacts, rituals, and ceremonies humans create and the symbols that influence the human experience.

About the Editors

Clifton D. Bryant is Professor Emeritus of Sociology at Virginia Tech University, where he served from 1972 to 2007. He was Department Head from 1972 to 1982. His teaching and research specialty areas include the sociology of death and dying, deviant behavior, military sociology, and the sociology of work and occupations. During his 47-year career, he enjoyed faculty status at six U.S. colleges and universities and two Southeast Asian universities. He also held Visiting Scientist status at three research institutes. He received his B.A. and M.A. degrees from the University of Mississippi, did advance graduate work at the University of North Carolina (Chapel Hill), and received his Ph.D. degree from Louisiana State University.

He served as President of the Southern Sociological Society (1978–1979). He was the recipient of the Southern Sociological Society's 2003 Distinguished Contributions to Teaching Award, and in 2007 he received its Distinguished Service Award. He was appointed to the Roll of Honor and received that award in 2009. The Roll of Honor Award is the highest award conferred on a member of the Southern Sociological Society and recognizes a career of distinguished intellectual contribution to sociology.

He was also president of the Mid-South Sociological Association (1981–1982). He was recipient of the Mid-South Sociological Association's Distinguished Career Award in 1991 and received its Distinguished Book Award in 2001 and in 2004.

His other reference works include *21st Century Sociology: A Reference Handbook* (coedited with Dennis Peck, 2007), the *Handbook of Death & Dying* (2003), and the *Encyclopedia of Criminology and Deviant Behavior* (2001). Beyond these reference works, he has authored or edited 11 other books and published articles in many professional journals.

Dennis L. Peck is Professor Emeritus of Sociology in the College of Arts and Sciences at The University of Alabama. He has authored and coauthored over 50 articles published in refereed journals and over 40 books, monographs, and book chapters. In addition to contributing to the learned literature throughout his career, during the present decade Dr. Peck has served as lead editor in chief of *21st Century Sociology: A Reference Handbook* (2007) and was instrumental in the creation of the four-volume *Encyclopedia of Criminology and Deviant Behavior* (2001), serving as coeditor of Volume 2 and associate editor for the entire project. In addition, Dr. Peck was a contributor to, and associate editor for, the *Handbook of Death & Dying* (2003), a publication that was recognized by the American Library Association as an outstanding reference of the year.

In addition to his interdisciplinary contributions in the general areas of deviant behavior, criminology, and death and dying, Dr. Peck was editor of *Sociological Inquiry*, the International Honor Society Journal of Alpha Kappa Delta, for 6 years. He has or currently serves on several editorial boards and in numerous professional association positions, including President of the Mid-South Sociological Association and the Alabama-Mississippi Sociological Association. While on leave from The University of Alabama on two occasions, he served in Washington, D.C., as a Senior Analyst with the Department of Housing and Urban Developments and with the Department of Education.

Dr. Peck's teaching and research interests are in the general areas of demography, the sociology of law, and deviant behavior. He has authored and edited several books, chapters, and journal articles in the areas of suicide, public health, psychiatric law, democracy, toxic waste disposal, life

without parole, human sexuality, urban development programming, post-traumatic stress disorder, program evaluation, divorce, social policy, and civility.

He was awarded B.S. and M.S. degrees from, and is recognized as Distinguished Alumnus of, the University of Wisconsin–Milwaukee. Dr. Peck earned a Ph.D. from Washington State University.

About the Editorial Board

Associate Editors

Kelly A. Joyce received her B.A. in anthropology from Brown University and her Ph.D. in sociology from Boston College. She is Associate Professor of Sociology at the College of William & Mary. Dr. Joyce's research focuses on the use of visualization technologies in medical practice. She is the author of *Magnetic Appeal: MRI and the Myth of Transparency*, has published articles on visualization in medicine in the journals *Science as Culture* and *Social Studies of Science*, and has a chapter in the edited volume *Biomedicalization: Technoscience, Health and Illness in the United States* (forthcoming). Dr. Joyce also investigates the intersections between health, aging, science, and technology. She has published articles in this area and is a coeditor of the 16th Sociology of Health and Illness monograph, titled *Technogenarians: Studying Health and Illness Through an Aging, Science, and Technology Lens*. Her current research examines autoimmune disorders, particularly lupus and Crohn's disease. Dr. Joyce is interested in the sociology of medical knowledge. Her research on autoimmune disorders considers medical constructions of the immune system and the gastrointestinal tract.

Vicki L. Lamb is Associate Professor of Sociology at North Carolina Central University and Senior Research Scientist in the Center for Population Health and Aging at Duke University. She received her M.S. in sociology from Virginia Tech, her Ph.D. in sociology from Duke University, and completed a postdoctoral fellowship at the Center for Demographic Studies at Duke University. She does research on the demography of health, disability, and the life course, and studies active life expectancy, successful aging, Medicare costs, elderly disability, and trends in long-term care of the elderly. Dr. Lamb is also interested in statistical methodology. Some of her recent journal publications appear in the *Proceedings of the National Academy of Science USA, Population and Development Review, Social Indicators Research, Journal of Health and Aging, Journal of Ambulatory Care Management,* and *Health Services Research*. She has contributed to numerous books and handbooks, including the *Handbook of Death & Dying* (2003), *Key Indicators of Child and Youth Well-Being,* the *Encyclopedia of Public Health, African American Family Life, Methods and Materials of Demography,* and *Determining Health Expectancies*. Dr. Lamb teaches graduate and undergraduate courses in social gerontology, medical sociology, demography, social statistics, and survey research methods.

Jon K. Reid is Professor of Psychology and Counseling at Southeastern Oklahoma State University, where he served as Chair of the Department of Behavioral Sciences for 6 years. He regularly teaches courses on human development, human sexuality, death and dying, and grief counseling. As a licensed professional counselor (Texas) for over 20 years, Dr. Reid has provided counseling in a variety of settings, including leading grief support groups in hospitals, churches, and schools. For 6 years, he served as a grief consultant for a children's grief camp held annually for 1 week in the summer. A member of the Association for Death Education and Counseling (ADEC) since 1995, Dr. Reid has served on a number of ADEC committees as well as on the ADEC Board of Directors. He has published articles in the journals *Death Studies, Illness, Crisis, and Loss* and the *Journal of Personal and Interpersonal Loss,* and a chapter in the *Handbook of Death & Dying* (2003). In addition, he has earned certification as a Fellow in Thanatology through ADEC.

Hikaru Suzuki is a social anthropologist whose research focuses on death and the funerary industry in Japan. Previously at Singapore Management University, Dr. Suzuki received her Ph.D. from Harvard and her M.B.A. from the University of

Wisconsin–Madison. Her book, *The Price of Death: The Funeral Industry in Contemporary Japan,* was based on her fieldwork with a funeral company in Kita-Kyushu, Japan. During this research placement, she worked as an employee, performing, on average, two wakes and one funeral per day. Dr. Hikaru participated in all elements of the funerary process, from picking up the deceased from the hospital; cleansing, bathing, and dressing the deceased; and sending off the deceased to the crematory, as well as arranging wakes, funerals, and memorial services. Among her other major publications are "McFunerals: The Transition of Japanese Funerary Services" (*Asian Anthropology*) and "Japanese Death Rituals in Transit: From Household Ancestors to Beloved Antecedents" (*Journal of Contemporary Religion*). She was recently a plenary speaker at the 8th International Conference on Death, Dying, and Disposal in Bath, United Kingdom, where she presented her paper "Japanese Funerals in the Global Age." Dr. Hikaru is currently editing *Death and Dying in Contemporary Japan*, which is planned for publication in 2010.

Michael R. Taylor is Associate Professor in the Department of Philosophy and an affiliated faculty member of the School of International Studies at Oklahoma State University. He teaches courses in social and political philosophy, applied ethics, philosophy of education, and perspectives on death and dying, as well as several nontraditional courses on ethics and globalization. His research focuses on social and ethical problems of international scope and is oriented toward a collaborative and multidisciplinary approach. Among his recent publications are *Pragmatism, Education, and Children: International Philosophical Perspectives* (coedited with Helmut Schreier and Paulo Ghiraldelli Jr., 2008), and "Illegal Immigration and Moral Obligation" in *Public Affairs Quarterly* (January 2008).

Lee Garth Vigilant received his Ph.D. from Boston College in 2001 and is Associate Professor of Sociology at Minnesota State University Moorhead. He teaches in the areas of classical sociological theory, qualitative methods for social research, contemporary sociological theory, social thanatology, health and illness, and social problems. He is a past recipient of the Donald J. White Teaching Excellence Award for Sociology at Boston College (2000) and the TCU Senate Professor of the Year Award from Tufts University (2001). Dr. Vigilant's past research focuses on the meaning of recovery in addiction subcultures. His peer-reviewed publications appear in the journals *Sociological Spectrum*, *Deviant Behavior*, and *Humanity and Society*. He is author of several sociological essays, encyclopedia entries, and book chapters. He is coeditor of the books *Social Problems: Readings With Four Questions* and *The Meaning of Sociology: A Reader* (9th edition). Dr. Vigilant is currently studying the social roles of fathers in home-schooling families.

Advisory Board Members

Andrew Bernstein is Associate Professor in the History Department and East Asian Studies Program at Lewis and Clark College, Portland, Oregon. He received his B.A. from Amherst College in 1990 and his Ph.D. from Columbia University in 1999. His research focuses primarily on modern Japan and is driven by a fundamental question: How do people build and maintain connections to the past in the midst of radical change? In *Modern Passings: Death Rites, Politics, and Social Change in Imperial Japan* (2006), he addresses this abstract question by examining how Japanese cope with a specific but universal question: What do we do with the dead? Dealing with this ever-present problem generally meant relying on ancestral solutions, which took the form of death rites that had developed over the centuries to build continuity in the face of loss. At present Dr. Bernstein is writing *Fuji: A Mountain in the Making*, a comprehensive "biography" of Mt. Fuji that explores the dynamic and contradiction-filled relationship between the volcano as a physical product of nonhuman forces and a cultural icon shaped by all-too-human hopes and desires.

Douglas James Davies is Professor in the Study of Religion at the Department of Theology and Religion, Durham University, United Kingdom, and Director of that university's Centre for Death and Life Studies. Previously Dr. Davies was Professor of Religious Studies at Nottingham University, where he also wrote a doctoral thesis on salvation in relation to the sociology of knowledge. He was educated at the Lewis School, Pengam, in South Wales, at Durham University's Departments of Anthropology and of Theology, and at the Institute of Social Anthropology at Oxford University. He has taught courses on death, ritual, and belief for many years at Nottingham University and Durham University. He is currently directing funded research

projects both on woodland burial and on emotion and identity in religious communities funded by the UK Arts and Humanities Research Council, as well as a major interdisciplinary project on cremation in Scotland funded by the Leverhulme Trust. Among his many publications on death are the coedited *Encyclopedia of Cremation* (2005); *A Brief History of Death* (2004); *Death, Ritual and Belief* (2002); *Health, Morality and Sacrifice: The Sociology of Disasters* (2002); *Death, Ritual and Belief, The Rhetoric of Funerary Rites* (1997); and *Cremation Today and Tomorrow* (1990).

Lynne Ann DeSpelder is an author, counselor, and Professor of Psychology at Cabrillo College in Aptos, California, and holds a Fellow in Thanatology from the Association for Death Education and Counseling (ADEC). Her writing in the field includes *The Last Dance: Encountering Death and Dying* (8th edition); *A Journey Through The Last Dance: Activities and Resources*; and most recently, "Culture, Socialization, and Death Education" in *Handbook of Thanatology*. She was corecipient of ADEC's Death Education Award. Lynne conducts trainings and speaks about death, dying, and bereavement both nationally and internationally, recently in Italy, England, and Japan. She is a member of ADEC, the International Work Group in Death, Dying and Bereavement, and is on the international editorial board of *Mortality.*

Kenneth J. Doka is a Professor of Gerontology at the College of New Rochelle, an ordained Lutheran minister, and Senior Consultant to the Hospice Foundation of America. Dr. Doka's books include *Death, Dying and Bereavement: Major Themes in Health and Social Welfare; Pain Management at the End-of-Life: Bridging the Gap Between Knowledge and Practice; Men Don't Cry, Women Do: Transcending Gender Stereotypes of Grief; Disenfranchised Grief: Recognizing Hidden Sorrow; Living With Life Threatening Illness; Children Mourning, Mourning Children; Death and Spirituality; Caregiving and Loss: Family Needs, Professional Responses; AIDS, Fear and Society; Aging and Developmental Disabilities; and Disenfranchised Grief: New Directions, Challenges, and Strategies for Practice*; and several *Living With Grief* titles. In addition, he has published over 100 articles and book chapters. Dr. Doka is currently editor of *Omega: The Journal of Death and Dying* and *Journeys: A Newsletter for the Bereaved*. He served as President of the Association for Death Education and Counseling and on the Board of Directors of the International Work Group on Dying, Death and Bereavement. In addition he has served as a consultant to medical, nursing, funeral service, and hospice organizations as well as businesses and educational and social service agencies.

J. C. Upshaw Downs has been employed as a medical examiner since 1989 and was Alabama's State Forensics Director and Chief Medical Examiner from 1998 to 2002. He has served as consultant to the Federal Bureau of Investigation (FBI) Behavioral Science Unit in Quantico, Virginia, and has authored four chapters in their manual *Managing Death Investigation*. Dr. Downs is the primary author of the FBI's acclaimed *Forensic Investigator's Trauma Atlas*. He has authored several books and chapters in the field of forensic pathology and child abuse. He has testified in state and federal courts, as well as before committees of the U.S. Senate and House of Representatives. He completed two terms on the Board of Directors of the National Association of Medical Examiners. He is on the Board of Advisors for the Law Enforcement Innovation Center at the University of Tennessee and the Board of Directors of the National Forensic Science Technology Center. Dr. Downs graduated from the University of Georgia. He received his M.D. degree and his residency training in anatomic and clinical pathology, and his fellowship in forensic pathology from the Medical University of South Carolina (Charleston). He is board certified in anatomic, clinical, and forensic pathology.

Michael C. Kearl received a B.A. in sociology from Dartmouth College and a Ph.D. in sociology from Stanford University. Dr. Kearl is Professor of Sociology at Trinity University, where he has taught for more than 30 years. In addition to the sociology and anthropology of death and dying, Dr. Kearl's primary areas of teaching and research include social gerontology, social psychology, the sociology of time, and the sociology of knowledge. Author of *Endings: A Sociology of Death & Dying* and webmaster of a website on death studies, his publications investigate such subjects as the political uses of the dead in civil religion, the rise of abortion as a political litmus test, the growing roles of the dead in popular culture, impacts of increasing cremation rates on the American death ethos, growing old in a death-denying culture, the ideological orientations of hospice workers, and American immortalism and its battles against extinction. During the 1980s he

served as a public member of the Texas State Board of Morticians and was involved in passing extensive consumer-oriented legislation. Dr. Kearl is currently writing *The Times of Our Lives,* a collection of essays that range from the prolongation of adolescence and its impacts on other life cycle stages to the implications of cultural golden years.

Michael R. Leming is Professor of Sociology at St. Olaf College in Minnesota. He holds degrees from Westmont College (B.A.), Marquette University (M.A.), and the University of Utah (Ph.D.). He has completed additional graduate study at the University of California, Santa Barbara. He is the founder and former director of the St. Olaf College Social Research Center and is a former member of the Board of Directors of the Minnesota Coalition of Terminal Care. He helped establish two hospice programs and continues to give lectures to hospice programs and caregivers for the dying and the bereaved and is involved in the education of future thanatology workers. He has served as a steering committee member of the Northfield AIDS Response and as a hospice educator, volunteer, and grief counselor. He is the author of numerous articles on thanatology and family issues and has taught courses on death and dying for over 30 years. He is the coauthor of *Understanding Dying, Death, and Bereavement* and *Understanding Families: Diversity, Continuity, and Change*. He is also the coeditor of *The Sociological Perspective: A Value-Committed Introduction*.

John L. McIntosh is Associate Vice Chancellor for Academic Affairs and Professor of Psychology at Indiana University–South Bend. Dr. McIntosh is the author, coauthor, or coeditor of six books on the topic of suicide (including *Elder Suicide* and *Suicide and Its Aftermath*) and has contributed chapters to several books and articles to many professional journals. He serves on the editorial boards of *Suicide & Life-Threatening Behavior* (associate editor); *Gerontology and Geriatrics Education; Crisis: The Journal of Crisis Intervention and Suicide Prevention*; and *Surviving Suicide*. He is a member of the Editorial Advisory Board of *Advancing Suicide Prevention* magazine. Dr. McIntosh is on the national Advisory Council of the Yellow Ribbon Suicide Prevention Program. He is a past president of the American Association of Suicidology, a past member of the American Association of Suicidology Board of Directors, and has served as Secretary of the AAS Board of Directors. His primary research areas are elder suicide, epidemiology of suicide, and survivors of suicide.

Robert A. Neimeyer is Professor and Director of Psychotherapy Research in the Department of Psychology, University of Memphis, where he also maintains an active clinical practice. Since having completed his doctoral training at the University of Nebraska in 1982, he has conducted extensive research on the topics of death, grief, loss, and suicide intervention. Dr. Neimeyer has authored 20 books, including *Meaning Reconstruction and the Experience of Loss; Lessons of Loss: A Guide to Coping;* and *Rainbow in the Stone,* a book of contemporary poetry. The author of over 300 articles and book chapters, he is currently working to advance a more adequate theory of grieving as a meaning-making process. Dr. Neimeyer is the editor of *Death Studies* and the *Journal of Constructivist Psychology,* and he is a past president of the Association for Death Education and Counseling. He was appointed to the American Psychological Association's Task Force on End-of-Life Issues, where he helped implement a research and practice agenda for psychology in this critical area.

John B. Williamson received a B.S. degree from the Massachusetts Institute of Technology and was awarded a Ph.D. in social psychology from Harvard University. Dr. Williamson is currently Professor of Sociology at Boston College, where he has taught a large undergraduate course on death and dying for more than 20 years. He has published 16 books and over 120 journal articles and book chapters. In the area of death studies he has published articles and book chapters on euthanasia, suicide, homicide, hospice, body recycling, death anxiety, symbolic immortality, terrorism, accidental deaths, maternal mortality, child mortality, and infant mortality. Among his coauthored and coedited books are *Death: Current Perspectives*; *The Generational Equity Debate; The Senior Rights Movement; Age, Class Politics and the Welfare State; Old Age Security in Comparative Perspective;* and *The Politics of Aging*. He is currently Chair of the Social Research, Policy, and Practice section and a vice president of the Gerontological Society of America. Dr. Williamson is affiliated with the Center for Retirement Research and with the Center for Work and Aging, both at Boston College. The focus of much of his current research is on retirement and the comparative international study of social security systems.

Preface

The essence of interdisciplinary thanatological study of death-related behavior is characterized in this two-volume *Encyclopedia of Death and the Human Experience*. Death and dying and death-related behavior involves the causes of death and the nature of the actions and emotions surrounding death among the living. The content of this comprehensive library reference is inclusive of the complex cultural beliefs and traditions and the institutionalized social rituals that surround dying and death as well as the array of emotional responses relating to bereavement, grieving, and mourning.

The *Encyclopedia of Death and the Human Experience* represents the theoretical and the practical. It is a compendium statement of the interdisciplinary, scholarly nature of death and dying research and study, as well as the practical applications of the knowledge generated by professional and lay persons whose career paths have been responsive to and reflective of the human experience. Moreover, the approximately 330 entries represent an array of approaches that portray the natural order of the life cycle as well as the socially constructed cultural artifacts created as humans attempt to deal with life experiences involving the anticipation of death, the process of dying, rituals in which the legacy of the deceased are celebrated, and the meaningful symbolic enhancement of a society through its cultural entities.

The content of this two-volume set is historical, it is contemporary, and it is futuristic. The entry titles result from the combined effort of experienced Sage Publications professionals with contributions by the editors. Based on this effort we are privileged to include in this manuscript the contributions provided by several generations of scholars who are, in turn, responsible for the initial and then extensive subsequent interest in death and dying research. Their efforts were not always appreciated within the previous mainstream of scholarly research, but the commitment of these individuals, many of whom contributed to this encyclopedia, stands as testimony to the creation of new pathways of knowledge. Moreover, their intense interest resulted, ultimately, in the creation of academic courses on death and dying and then the creation of programs that are, in large part, responsible for all the entries presented in this two-volume set.

The international contributors bring important interdisciplinary and cross-cultural perspectives to the encyclopedia. The many fine international scholars and practitioners are from Africa, Asia (China, Hong Kong, and Singapore), and Australia; North and South Americas; and many European countries, including France, Great Britain, Iceland, Ireland, Italy, and Spain. Included among the authors are research scholars, health practitioners, and counselors of many areas of expertise, and members of the arts. These individuals represent, or are engaged in, the practice of anthropology, the clergy, counseling, economics, education, English, evaluation research, family studies, fashion advisors, history, law, medical researchers and clinicians, museum directors, nursing, organization directors, political science, psychiatry, psychology, religious studies, sociology, and social work. This experienced group of talented contributors offers important insight into the process of dying and the phenomenon of death. Along with the special focus on the cultural artifacts and social institutions and practices that constitute the human experience, the combination focus on the human condition and experience makes this an extraordinary reference encyclopedia.

Project Description

Interest in the varied dimensions of death and dying has led to the development of death studies that

move beyond medical research to include behavioral science disciplines and practitioner-oriented fields. As a result of this interdisciplinary interest, the literature in the field of death and the human experience studies has dramatically increased during the past 20 years. Death-related terms and concepts that encompass global beliefs and traditions, death denial, and social movements as well as interdisciplinary and practitioner-oriented perspectives on death now hold important ecological, family, economic, medical, legal, religious, and global social-psychological consequences. Examples include death-related terms and concepts such as angel makers, appropriate death, Chinese death taboos, death anxiety, the postself, body farms, dance of death (*danse macabre*), equivocal death, end-of-life decision making, near-death experiences, cemeteries, ghost photography, halo nurses, memorials, viatical settlements, second burial, suicide, medical mistakes, advance directives, caregiver stress, SIDS, cryonics, cyberfunerals, global religious beliefs and traditions, and death denial. As a result, many terms and phrases are now part of common social discourse and media reporting. But the lexicon relating to dying, death, and the emotions, activities, and policy relating to the human experience is expansive, thus lending itself to the need to establish consistency in vocabulary of death meanings. The *Encyclopedia of Death and the Human Experience* does so, and this two-volume library reference is enriched through important multidisciplinary contributions and perspectives as it arranges, organizes, defines, and clarifies a comprehensive listing of approximately 330 death-related issues, concepts, perspectives, and theories for use by students and scholars, while facilitating a more refined and sensitive understanding of the field for an increasingly interested public.

Development of the Project

The initial list of entries was compiled through a search of learned journals and topic-specific textbooks. Such searches were useful for identifying the classic concepts, theories, and terms, but suggestions that identify emerging concepts and work currently being conducted came from an even more valuable resource, namely the members of the encyclopedia's editorial board and from scholars and practitioners who recommended prospective entries be considered even after a final list of topics had been compiled. Thus, the richness of the total list of entries results from the interest and input of the many individuals who have so freely given to this project.

Authorship of the entries was developed in a similar manner. Recognized contributors to the area of thanatology study were requested to offer their considerable insight and talent by crafting entries. In turn, the authorship list was expanded as networks were identified and specific authors were invited to participate. Ultimately, interest in this project was to take on a life of its own as the project became international in scope.

The Reader's Guide

Developed around 16 categories, the Reader's Guide includes approximately 330 entries, many of which address traditional death- and dying-related topics. But, in addition, a special focus on the human experience enhances the overall substance of this work. This important focus on the human condition blends an interesting array of new topics with traditional entries to create a unique dimension to the study of death and dying.

Conceptualization of Death, Dying, and the Human Experience: This introductory category offers the definition and conceptualization of death and the human experience from the interdisciplinary perspectives that are representative of the *Encyclopedia of Death and the Human Experience*. These areas include the humanities, social sciences, religious perspectives, medical sciences, and legal approaches to understanding the increasingly complex issues involved in death and dying and for those who must continue to function in the aftermath of the death of a loved one. Special focus is accorded the secular scientific approach with topics that include forensic anthropology, forensic science, and the process leading to the medicalization of death and dying.

Arts, Media, and Popular Culture: This category consists of the kinds of entries that lend insightful discussion of the display and depictions of death in art, literature, photography, sculpture, architecture, wax museums, and museums of death. A more contemporary characterization of death is noted in entries that address popular culture movies and video games with a death theme.

Causes of Death: This category consists of entries that address issues of social and historical significance as well as important contemporary policy implications. The leading worldwide causes of death are prominently represented. This section also include entries pertaining to capital punishment and prison deaths, drug use and abuse, man-made and natural disasters, spontaneous combustion, subintentional death, domestic and international terrorism, and tobacco use.

Coping With Loss and Grief: Special attention is cast toward the living as they try to cope with issues attendant to dying and death. Included in this category is historical coverage of grief, bereavement, and mourning, each of which is found in abundance in the contemporary experience. Ranging from entries titled Denial of Death and Death Anxiety to those of Gold Star Mothers, Instrumental Grieving: Gender Differences, the Postself, and Widows and Widowers, this section includes entries that address the individual micro-level and macro-level human experiences and the consequences relating to dying and death.

Cross-Cultural Perspectives: This is a category of exceptional entries that lends credence to the ancient beliefs, traditions, and practices and perspectives toward dying and death, and those among the indigenous tribes of Australia and North America. A compendium statement of the social, cultural, and moral views is found within *The Tibetan Book of Living and Dying* entry. Included also is a cross-cultural perspective of the death care industry, the social functions of death, and Chinese death taboos. Such entries add a special tone to these international orientations.

Developmental and Demographic Perspectives: This category is represented by entries that cover the stages of life and the relational effects of mortality rates when variables such as age, life expectancy, marital status, gender, and social class on death rates are controlled. Other factors include the effects of death on the family composition, theories of population growth and decline, and sexual activity.

Disposition of the Deceased: Representing one of the larger Reader's Guide categories, this section encompasses entries on the historical practice of mummification in ancient Egypt and the more contemporary entries up to the societal need to commemorate its heroic fallen warriors with entries such as Cemeteries and Columbaria, Military and Battlefield and the Tomb of the Unknowns. The recent movement to establish green burial and virtual cemeteries and the personal need to remember family pets through burial in pet cemeteries also have representative entries.

Funerals and Death-Related Activities: This category identifies the importance of death on the body politic through its social cultural rituals. This is aptly demonstrated with entries that cover clothing and fashion, cosmetic restoration, the death notification process, and the funeral industry.

Legal Matters: This category includes topics such as the death certificate, equivocal death, forensic science, the legalities of death, and the psychological autopsy. Topics of more recent social significance include living wills and advance directives and viatical settlements.

Mass Death: This noteworthy category of topics holds historical and contemporary significance it that it covers the conditions that result from war, terrorism, and disease. The additional inclusion of tragic events such as school shootings, genocide, and the Holocaust make this a section that will draw attention to what has been referred to as the inhumanity of the human species toward its own.

Process of Dying: From entries such as The Art of Dying (*Ars Moriendi*) and Quality of Life, Halo Nurses Program, and Life Review to the entry Persistent Vegetative State, this category of the Reader's Guide is designed to keep readers reading one interesting topic after another. It is full of history of the hospice movement and addresses the influence advancing technology has on preserving life as well as maintaining the dignity of the dying.

Religion: The institution of religion has important implications for dying and death and for those who are interested in eschatology. Included are entries that address the major world religious beliefs and traditions as well as the spiritualist beliefs of the more ancient past. The perspective of nonbelievers also is offered.

Rituals, Ceremonies, and Celebrations: Celebrating the past includes honoring the dead. These entries

nicely complement the previous classification of religious oriented entries while also offering a convenient category of topics that describe cross-cultural events such as Day of the Dead, funeral conveyances, Ghost Month, Halloween, Memorial Day, and holidays of the dead. The concept of postself and the funerary custom of sin eating make this a most interesting category of entries.

Suicide, Euthanasia, and Homicide: A set of topics with a sociohistorical and legal legacy, many of the entries in this section suggest the same may be true for the contemporary experience. Suicide was once considered illegal behavior, and the penalty for a failed suicide attempt was, ironically, death. At another point in time, the penalty for a successful suicide was state confiscation of the deceased's property, a clear detriment to survivors. Euthanasia or an easy death is a cause for ethical outcry and for some individuals a moral outrage, while the homicide concept represents a variety of contemporary subcategories that address different interpretations of those acts that result in the taking of the life of another.

Theories and Concepts: The foundation of an area of study lies in its theories and concepts; the same is no less true for thanatology. This section presents topics that conceptualize and portray death and the human experience with an interdisciplinary sociocultural perspective that also includes topics on demography, education, economics, and history.

Unworldly Entities and Events: The final category represents the unusual, but may, for some readers, represent one of the more interesting categories. These well-written entries include Curses and Hexes, *Frankenstein*, Ghost Photography, Ghosts, Witches, and, finally, Zombies, Revenants, Vampires, and Reanimated Corpses.

Visual Aids

The selective use of charts, figures, graphs, tables, and pictures (e.g., the use of a life table for the entry Life Expectancy) is designed to enhance the reader's impression of the topic. Although tables usually contain an array of interesting descriptive and inferential information such as is found in the entry Death, Line of Duty and the entry Life Expectancy, most of the information of this nature has been integrated within the well-developed descriptive narratives crafted by the contributing authors who are so well versed in their topic that visual aids are not necessary. Where these visual aids are utilized, however, the effect is most dramatic. One such example is that of the entry Clothing and Fashion, Death-Related, which has a pictorial display of individuals who have fashioned their burial cloths. Another example is the Funeral Conveyances entry for which many exquisite pictures of hearse wagons and other modes of transportation of the dead are provided.

A Scholarly Library Reference and Resource for the Novice and Other Interested Readers

The *Encyclopedia of Death and the Human Experience* is intended as a resource for the upper division undergraduate student as well as others interested in this intriguing area of study. With such an array of topics that include traditional subjects and important emerging ideas, the encyclopedia will undoubtedly enhance the research efforts of the undergraduate who seeks to develop that challenging class paper. Lay readers also will find much to stimulate their thoughts. For the graduate student and the faculty member who strive to secure a compendium statement for lectures or for establishing a basic research agendum, this encyclopedia will prove to be a most useful resource.

The *Encyclopedia of Death and the Human Experience* is the result of the contributions of many people. The entries were crafted by individuals who are well known and well versed in the complexities of the dying and death arena. Many of the contributors to this encyclopedia have long been recognized as the founders of, and contributors to, this important area of teaching and research study. In addition, a number of in-service practitioners who do not always receive appropriate recognition are well represented; in this instance their entries blend nicely within the overall structure of the encyclopedia. Finally, some very interesting and intriguing entries have been created by rising scholars whose current efforts lend themselves to potential national and international recognition in the near future.

Dennis L. Peck

Introduction

Humans are the only knowledge-accumulating animals. The history of humankind is fundamentally the history of, search for, acquisition of, and accumulation of knowledge. With accumulated knowledge, humans have been able to survive, endure, and prevail. With knowledge, they can adapt to the physical and objective world in which they live, with its changes in climate, terrain, and weather and its wide variety of flora and fauna. Knowledge enables us to adapt to the social and subjective world in which we live, to form meaningful relationships with other people, and to meet the collective need for understanding. Coming to understand the world in which we live enables us to solve problems, overcome challenges, and confront uncertainties and fears. Knowledge expands at an exponential rate, precipitating the development of technology, driving the increasing rate of progress, and enhancing the quality of life and the human condition.

Prehistoric humans existed in a state of ignorance. They lived in a world of mysteries and enigmas. They did not know why the sun rose and set, or why the moon changed shape and brightness. They did not understand rain, or thunder, or lightning. They did not understand seasonal differences in weather and climate. They did not understand why they sometimes became ill. Perhaps the greatest enigma of all was death. Why did their loved ones become sick and die, and why did the bodies of the dead become cold and stiff? The body was still there, but what had happened to the spirit within the body?

Prehistoric burials provide insight into how inhabitants of that era answered these questions by constructing belief systems regarding death, the dead, and existence beyond death. Prehistoric people may well have concluded that their cold, stiff companions were simply in some form of lengthy sleep. They may have conceptualized a bifurcation or separation of body and spirit in which the spirit left the body, as in a dream, and went elsewhere, perhaps to return at some later date. Such an explanation suggested that there must be some type of existence beyond death. The fact that the dead were often buried with stone implements and cooked food reinforces the conclusion that these prehistoric people believed in an existence after death in which their dead comrades would need food and tools.

The decision to bury the dead body, often in caves, was likely motivated by the obnoxious smell of the putrefying body, the concern that the smell might attract predators, and the desire to keep their loved ones close at hand and protected or insulated from the elements and animals, in anticipation of the return of the spirit to the lifeless body. Deceased individuals were sometimes buried in a sleeping position, laid to rest, as it were. Archeological evidence suggests that the buried bodies had sometimes been smeared with red ochre (a type of clay dust), possibly to simulate the appearance of blood, like that on an infant just after birth. Perhaps this practice was intended to magically precipitate or facilitate a rebirth from "mother earth," or even reincarnation or rebirth as a different individual (or as an animal).

Archeological evidence indicates that many prehistoric burials contained grasses, tree boughs, and other soft vegetation, a further indication that prehistoric peoples were concerned about the comfort and well-being of the dead. They may also have believed that the dead would somehow be aware of their efforts to make the grave comfortable. In some burials, the paleo-remains of bright flowers were found, suggesting affection, reverence, and respect for the dead. In some burials, there was archeological evidence of ibex skulls and horns

stuck in the ground in a circular fashion around the body. In others, there were similar, curious but stylistic arrangements of animal remains near the burial site. This indicated that a degree of ritualism attended the burial. Most importantly, the evidence and inferences uncovered in these archeological gravesites demonstrates that these prehistoric humans had well-defined death belief systems.

Over the millennia, death belief systems became more elaborate, convoluted, and more esoteric, being shaped by the cultural contexts in which they were constructed and evolved. These complex death belief systems served to frame death and the dead in a more understandable and controllable fashion and played an important role in the origin of religions. The evolving religious belief systems had at their core conceptualizations of death and the afterlife, and notions of through which mechanisms one could achieve the afterlife.

Totemism is another example of the evolution of death belief systems. Archeologists suggest that the dreams of prehistoric peoples may have included images of certain animals, and conceivably even some type of relationship with the animal. Such dreams may have led prehistoric people to postulate linkages between humans and special types of animals, and such beliefs may have been the origin of totemism. Totemism is the concept that there is a special relationship between a particular type or species of animal (or even plant) and the members of some social groups (especially kinship groups). The linkage often involves a protective reciprocity and a spiritual relationship among humans, animals, and nature. This belief system includes the idea that humans are descended from their totemic animals or that humans and their totemic animals are descended from similar spirits. It is thought that when a human or totemic animal dies, their spirits mingle with each other in some spiritual sacred place. One of these kindred spirits (human or animal) may enter the body of a woman, impregnating her; thus, human or totemic animal spirits may be reborn in either human or animal form. Such beliefs were the progenesis of reincarnation, which became the basis of death belief systems and later evolved into more complex religious systems.

The English philosopher Herbert Spencer posited that religion was the product of the fear of death and the dead. In effect, death belief systems were the origin of religious belief systems, which, in turn, evolved over time into more organized and coherent religions. It was through religion that humans were able to conceptualize, confront, control, and transcend death. Men and women could neutralize and assimilate the prospect of death through adherence to their religion and the death belief systems component to it.

By the time the ancient civilizations of Asia, the Middle East, and Egypt emerged, knowledge about death and scenarios concerning existence after death had expanded and proliferated to the point where it was sometimes aggregated into books or other records. An example of this is the *Papyrus of Ani,* more popularly known as *The Egyptian Book of the Dead,* which was written and compiled somewhere around 1240 B.C.E. The *Papyrus of Ani* is a 78-foot funerary papyrus scroll or roll that contains vividly colored images or vignettes of scenes of existence in the afterlife, accompanied by an extensive text in hieroglyphs. Its purpose was to assist its owner in the next world. This collection of texts based on the religious views of that time includes prayers, incantations, rituals, spiritual visions of the afterlife, and descriptions of the soul's journey in that existence—essentially a kind of encyclopedia of Egyptian eschatology (the study of scenarios of existence beyond death).

Over the centuries, aggregated knowledge of death, dying, and/or the afterlife appeared in many forms. For example, *The Tibetan Book of Living and Dying* contains descriptions of the afterlife, instructions on attending someone who is dying or recently has died, prayers, and a guide for "spiritual liberation." Major religious works such as the Bible, the Qur'an, and the Torah usually included information about death and the afterlife. Compendiums of knowledge about death sometimes appeared in curious venues. For example, *senet*, an ancient Egyptian funery board game, simulated the soul passing through the myriad stations or houses component to the netherworld or hereafter. The players would cast their dice sticks and move their playing pieces across a board decorated with symbols of the various houses of the dead. This game, not unlike the modern game of Monopoly, allowed the players to symbolically act out various scenarios of the death journey. *Senet* was another example of a compendium of ancient Egyptian eschatological knowledge.

Another example of an unusual venue of accumulated knowledge about death is a long tunnel in a cemetery located just outside Taipei, Taiwan, decorated with mural scenes portraying the various stages of life, and also scenes from the afterlife that will be experienced by individuals when they die. Walking through the tunnel simulates the journey of life and death, thereby informing the visitors regarding Chinese eschatology.

During the Middle Ages, devout Christians sought to meet death with equanimity. To aid in accomplishing this, two Latin texts of accumulated knowledge about dying were published and provided instructions, protocols, rituals, and advice on how to prepare to die and achieve the good death. These texts, one long and one in a shorter version, were titled *Ars Moriendi*. The longer version, authored in 1415, was widely read and translated into various European languages, including English. Over time, it was published in approximately 100 editions and became the definitive exposition on the art of dying well.

For centuries, first in Europe and later in North America, Christianity was able to control death, "tame" it, and make it "captive," as it were. For most people, death was not only natural and inevitable but also accepted and anticipated. Through the strength of their religious belief and faith, individuals could confront the prospect of their own mortality, secure in the conviction of salvation and eternal life beyond death. For centuries, the equilibrium of religion, knowledge about death and the afterlife, and personal belief insulated individuals from the fear of death.

By the 20th century, the evolution of science and technology, combined with the dilution of religious belief, had eroded this insulation, and death was no longer "tamed" and "captive." New coping mechanisms were needed. Americans now became "death-denying," pushing death out of sight and out of mind. Death was hidden and transformed into a less fearful and traumatizing entity. Some modern-day thanatologists such as Geoffrey Gorer posited the idea that like sex being a taboo topic (pornograpy, if you will) during the Victorian era, there was a generalized taboo regarding discussions of death and dying during the first half of the 20th century. In effect, the pursuit of death denial rendered death "pornographic." Many changes in customs, protocols, and social behavior helped make death less visible and intrusive. The accumulation of death-related knowledge slowed.

After World War II, in spite of cultural efforts to maintain this façade, death was rediscovered, and the new death awareness movement gathered momentum. By the turn of the century, death had been fully rediscovered and exposed. The knowledge of death was now pervasive and was disseminated in numerous venues—the mass media, trade books, textbooks, and periodicals.

Over the centuries, and particularly in contemporary times, a variety of themes have appeared in death-related knowledge. One of the more central of these themes has been that of confronting and transcending death. Throughout history and across cultures, humans have constructed strategies and mechanisms for assimilating death. Among such strategies are constructing religious eschatological scenarios of an existence after death, denying death, developing philosophical postures to neutralize death, keeping the dead alive via spiritualism or an acceptance of the notion of ghosts, accepting accounts of near-death experiences, fostering a belief in reincarnation, and accommodating a social exchange for death.

Another theme is that of exploring causal modes of death, the variant interpretations of death based on cause and context, and the social construction of death. Although the causes of death in contemporary society are myriad, many deaths are esoteric in cause, or occur with modest frequency. There are, however, major causal modes of death. On a global basis, especially in third world countries, there are massive deaths from natural disasters, infectious and parasitic diseases, localized wars, insurgencies and revolutions, infant starvation and dehydration, and death in childbirth, to mention only some. In the contemporary United States, more than one-half of all deaths result from major cardiovascular diseases and malignancies (cancer). Other leading causes of death include stroke, pulmonary diseases, accidents, pneumonia, and chronic liver diseases. Different causes of death may have disparate social consequences. Certain modes or aspects of death are subject to contention and controversy, such as suicide, euthanasia, abortion, and capital punishment. Information about, and arguments for or against, these issues have added to the accumulation of knowledge in this area. Death is often

more a social process than an event, and significant knowledge has been generated on the anticipation of death, the process of dying, and the institutional context of dying.

Throughout history, perhaps, the most important social ceremonial response to death has been that of funeralization. The significant elements of funeralization are notification, body preparation, the structure and dynamics of funerals, cross-cultural and historical aspects of funeralization, and postfuneralization activities. A considerable body of knowledge of some significance has accrued for incorporation into this theme.

Another death-related theme is that of body disposition. The choice of body disposition is more the product of culture than personal choice. Throughout history, and in most cultures, earth burial and incineration have been the primary modes. There have been, however, exceptions to these norms, such as mummification, and today there are numerous options available, ranging from body recycling in the form of organ donations, to long-range preservation via cryonic suspension. A considerable body of knowledge pertaining to this theme has been generated and accumulated.

A theme of some centrality is that of grief, bereavement, mourning, and survivorhood. Much research, writing, and scholarship has addressed these topics and produced a substantial literature. Although much of this work has been done in recent years, there was also earlier discussion of these issues. For example, toward the end of the 19th century, most books of etiquette devoted almost one half of their contents to bereavement and mourning behavior.

There are multiple themes of death in artistic creations, including paintings, architecture, sculpture, literature, music, and drama, to mention but some. Some thanatological artistic impressions conceptualize death in a variety of forms. Others focus on the confrontation with death or the cause of death. Yet others depict grief, bereavement, and mourning. Obviously these themes have their roots in antiquity, with the result that there is a vast amount of knowledge in this area.

Death is not without its legal parameters, and a substantial amount of thanatological knowledge deals with legal issues. Some death-related legalities are centuries old, such as the matter of testamentary inheritance. Other legal concerns, such as death certificates, cemetery regulation, and the notion of wrongful death, are somewhat more recent. Still other legal matters, such as living wills and the concept of thanatological crime, are quite contemporary.

Humans like to look ahead and seek glimpses of the future. Already futurists and other scholars of prognostic inclination are constructing scenarios of events, processes, products, changing attitudes, and other death-related human social, death-related activities. These endeavors promise a new plethora of knowledge.

Knowledge often proliferates to the point of becoming massive, unwieldy, and unmanageable. To be useful, knowledge must constantly be sorted, arranged, packaged, stored, even pruned, and configured into practical forms and be readily retrievable. Works such as dictionaries, anthologies, bibliographies, compendiums, directories, handbooks, and encyclopedias often facilitate this accomplishment.

The *Encyclopedia of Death and the Human Experience* attempts to make death-related knowledge available, accessible, and readily retrievable. With approximately 330 concise, informative, and authoritative entries authored by a group of eminent scholars from many countries, it covers the field of thanatological knowledge in a comprehensive fashion. The entries reflect all of the death-related themes previously articulated and represent the latest state of knowledge on all of the topics. Hopefully, this reference work will appropriately inform and instruct the reader seeking to better understand the enigma of death and its import for the social enterprise.

Clifton D. Bryant

Acknowledgments

The *Encyclopedia of Death and the Human Experience* is the summation of the Advisory Board members—Andrew Bernstein, Douglas Davies, Lynne Ann DeSpelder, Kenneth Doka, J. C. Upshaw Downs, Michael Kearl, Michael Leming, John McIntosh, Robert Neimeyer, and John Williamson—who offered so many well-received recommendations, the contributions of the many authors who gave freely of their time and talent, and the dedication and diligent efforts of the associate editors. This encyclopedia was made possible with the most capable assistance of the associate editors, Drs. Kelly Joyce, Vicki Lamb, Jon Reid, Hikaru Suzuki, Michael Taylor, and Lee Garth Vigilant. Each of us was familiar with editing; however, none of us knew what to expect in editing entries for an encyclopedia given the parameters are quite specific (in a general sort of way). But we did work it out, sometimes through trial and error, and we learned from each other. Perhaps more importantly, the contributing authors had a great influence on this learning experience and, for the most part, each of the contributors responded to our editing, and to what I will describe as constructive suggestions, in a most positive manner. Ultimately it is to this fine group of authors and editors that this encyclopedia is dedicated.

But there are many individuals to whom a special appreciation is appropriate. Rolf Janke is to be thanked for having conceptualized the notion of developing an encyclopedia on death and dying and for having made the decision to operationalize such an effort. We hope that the product fulfills his vision. The initial interest expressed by Acquisitions Editor James Brace-Thompson was instrumental in moving this project from idea to fact. Along with the input provided by Ms. Diana Axelsen, the assistance of Mr. Brace-Thompson was influential in the creation of the 325-entry headword list upon which this encyclopedia was built. Over the course of several months, some additional topics were suggested by contributing authors, of which five more topics representing emerging areas of analyses were added. The resulting final list of 330 entries makes this encyclopedia extraordinary in its coverage of the field.

From the preliminary stage of preparation and training to become familiar with the Sage Reference Tracking system to the submission of the final manuscript to the production editor, two Sage staff members were to prove invaluable to the completion of the manuscript. The contributions of Development Editor Ms. Sara Tauber and Systems Coordinator Ms. Laura Notton are too numerous to list. Each was responsive to any request for assistance whether from author or editor; each was supportive and encouraging of our overall effort.

Production Editor Tracy Buyan was kind enough to assign copy editors Ms. Amy Freitag and Ms. Colleen Brennan to finalize the process. Professional in presentation and thorough in action, each of these individuals made the final phase of the project a most interesting and easy experience.

And finally to my wife Peggy, I again express my deep appreciation and love for her support, patience, and on occasion her invaluable assistance rendered when the need for such assistance was essential to maintaining a semblance of organization and structure. The commitment to carrying out this project may not always have been understood, but she did not waiver in providing the support essential to completion of the task. Ultimately Peggy came to recognize that for me this project has been a labor of love.

Dennis L. Peck

A considerable measure of gratitude is owed to Heidi Browne, who worked tirelessly on this project, doing library and computer research, solving computer problems, assisting in compiling lists and death-related websites and organizations, generating bibliographies, and tracking down fugitive literature on death and dying. She rendered innumerable other valuable services during trying times. Many thanks to her for being such a stalwart member of the team.

I am deeply appreciative of the efforts of my coresearcher, publishing partner, and wife of 52 years, Patty Bryant, who handled all of my e-mail traffic, maintained e-mail logs, handled myriad administrative and operational details, poured over bibliographies, and searched the web in the process of aiding me in identifying and recruiting a distinguished editorial group. She spent countless hours searching my 30 years of archives of research and lecture notes on death and dying and my extensive library of thanatological books in the search for meaningful entry topics. She provided me with assistance, advice, counsel, and encouragement for all of which I owe her an enormous amount of gratitude, love, and affection.

Abortion

Abortion is the termination of pregnancy before the embryo or fetus can develop to the stage at which it can be born alive. Abortion usually is considered as induced abortion. However, in medical terms, it also includes spontaneous abortion (miscarriage), which might be due to natural causes or accidental situations. Researchers have found that unintended pregnancies are the roots of abortion, and most unintended pregnancies result from not using any contraceptive. Recent studies also show that abortion rates around the world are lowest where abortion is legal and widely available, and contraceptive use is high. There are both medical and surgical procedures for induced abortion; choice of procedure depends on the number of weeks of the pregnancy, the laws, local availability, and doctor/patient preferences.

Reasons for seeking an abortion, from a legal view, include saving the mother's life, preserving the mother's physical or mental health, rape or incest, fetal impairment, social or economic reasons, and no reasons. Abortion laws and policies have changed numerous times in various countries around the world. Pro-life and pro-choice groups often seek support from lawmakers and policymakers. However, no study has shown that the level of restrictions in abortion laws significantly affects abortion rates. The abortion debate within society is a notable phenomenon and influences public opinion and attitudes toward induced abortion. There are debates on the issues of pro-life and pro-choice, physical and mental health, minors' consent with parental involvement, and other controversies.

Whether the abortion is induced or spontaneous, the situation may profoundly affect the woman and her partner or family members in various ways, including physical, psychological, spiritual, and social ways. Therefore, abortion counseling or consultation plays an important role in the course of abortion for the woman, starting from the point of being informed about the unintended pregnancy or impaired development of the fetus and ending in a recovery room after the procedure has been performed.

History and Trends of Abortion

Before the 19th century, induced abortion was applied as a way of birth control in many countries. Pregnancies in early months terminated by using herbs, sharp instruments, or other techniques were generally accepted. In 1861, the *Offences Against the Person Act* was passed to outlaw abortion in the United Kingdom, and the Roman Catholic Church also prohibited abortion under all circumstances in 1869. Similar opinions prevailed in other countries thereafter.

Key findings on abortion trends around the world during the period 1995 to 2003, reported by the Guttmacher Institute, include (a) the global abortion rate had declined, (b) abortion rates had declined more in developed countries than in developing countries, (c) the rates had dropped most dramatically in Eastern Europe and Central

Asia, and (d) unsafe abortion rates had increased. Studies have found that the patterns of using contraception can affect abortion levels. This includes contraceptive availability, effectiveness, service quality, and improved technology. There is no evidence showing that the level of restrictions in abortion laws affects abortion rates.

European countries also experienced that a combination of sufficient information on contraception and societal acceptance of adolescent sexual relationships would lower unintended pregnancies among teenagers.

Types of Abortion

Spontaneous Abortion

A spontaneous abortion occurs in early pregnancy before the 20th week of gestation because of abnormal development or environmental factors. If a fetus dies during late gestation after the 20th week in the uterus or during delivery, it is usually regarded as a "stillbirth."

Induced Abortion

Induced abortions include therapeutic abortion and elective abortion. The former is performed for medical reasons, such as saving the life of the mother, preserving the mother's physical or mental health, or resolving other medical problems. Elective abortions take place by personal choice for social or economic reasons, such as having had enough children, wanting to delay the next birth, having relationship difficulties, having difficulties affording a child, or having been raped.

Methods of Abortion

Medical Abortion

With the use of the compound drug mifepristone, medical abortion can be performed within 49 days after a woman has become pregnant. The first use of mifepristone (RU-486) legally was in France in 1988, and it was legalized in the United States in 2000.

The regimen, a combination of different dosages of mifepristone and prostaglandin, became a contemporary abortion procedure in recent years. According to the safe abortion guidance published by the World Health Organization (WHO), mifepristone plus prostaglandin regimens have been proven to be safe and highly effective for the first 9 weeks and over 12 weeks of gestation with different dosage combinations. However, these regimens are currently only available in a few developing countries.

Surgical Abortion

Vacuum aspiration is a common surgical procedure to be used in the first 12 weeks of gestation; dilation and curettage (D&C), a standard gynecological procedure, can also be used during this period. Another common surgical abortion method, used with women who are more than 12 weeks pregnant, is dilation and evacuation (D&E).

Abortion Laws and Policies

According to English common law in the 19th century, induced abortion could be performed legally before quickening (i.e., movements felt by the mother). Both pre- and postquickening abortions were against the law in many countries. The Soviet Union in 1920 and Iceland in 1935 were two of the first countries, with legislation, to allow abortion. The United Kingdom passed the Abortion Act in 1967 to allow abortions to be performed for limited reasons. In the 1973 case of *Roe v. Wade*, the U.S. Supreme Court ruled that state laws banning abortion violated the Constitution on privacy rights.

From a legal perspective, there are seven reasons for allowing induced abortion: (1) saving the life of the mother, (2) preserving the physical health of the mother, (3) preserving the mental health of the mother, (4) pregnancy resulting from rape or incest incidents, (5) unborn child with medical problems or birth defects, (6) social or economic reasons, and (7) no need to give a reason. However, various countries have many different restrictions on abortion law. Most of the countries around the world allow abortion for the reason of saving the mother's life except for some predominantly Catholic countries, such as Chile, El Salvador, Malta, and Nicaragua, and Vatican City in Italy. Whereas under no circumstance is abortion legal in these Catholic countries, 16% of 198 countries in the world allow abortion for any reason, including "no need to give a reason."

Informed Consent

Under English common law, patients have to give their consent prior to a nonemergency medical treatment. In 1982, a panel studying "the ethical and legal implications of the requirements for informed consent" created by the U.S. Congress concluded that informed consent should consist of three important elements: (1) Patients must have the ability to make decisions about their medical care; (2) patients have to participate in the decisions voluntarily; and (3) patients have to be provided adequate, appropriate information on which to base their decisions. On the issue of the decision making, there have been extensive legislative discussions and litigations involving adolescent abortion decisions. Most abortion laws require parental involvement in the termination of adolescent pregnancies. Second, a patient has the right to make her/his own choice, and the decision should not be the result of manipulation by other people. The final element about giving information is also an ethical requirement in the practice of medicine. This information should include the nature, risks, and benefits of the treatment and the availability of, and alternatives to, abortion.

Abortion Controversy

An intentional abortion by human action has become a controversial and debatable issue through history. Induced abortion is a sensitive topic that raises political, religious, legal, ethical, moral, cultural, philosophical, and biological issues.

There are two main groups in the abortion debate: pro-choice and pro-life. These two sides have been seeking legal support and trying to influence public opinion over the course of the history of abortion. Pro-choice advocates that abortion is morally permissible and supports access to abortion, while pro-life is in favor of legal prohibition of abortion and regards it as morally wrong.

Much research and discussions have been conducted on health risks of abortion including future fertility difficulties, breast cancer, and mental health problems. While some of this research strongly asserts that abortion does have an effect on many aspects of women's health, there are also studies that show evidence that abortion is not significantly associated with the stated risks above.

Abortion Counseling or Consultation

Abortion counseling or consultation, which is also considered as pregnancy counseling, plays an important role in the course of an abortion as it is a psychologically supportive conversation session for the woman who is pregnant unintentionally and facing a critical situation to make decisions. It is also important for the woman to obtain adequate information on abortion procedure and contraceptive use afterward. In some countries, a consultation conversation is an information-oriented session, while counseling focuses more on resolving personal conflicts, emotional problems, or disturbance. And other countries use "counseling" for both psychological and informational services.

Abortion counseling can be categorized as four kinds: pregnancy test counseling, pregnancy options counseling, preabortion counseling, and postabortion counseling. All of these kinds of counseling sessions might have similar content; however, the woman may have different emotional and cognitive changes. The counselor often has to focus on her various needs at different stages along the course of abortion.

Pregnancy Test Counseling

At the time the pregnancy test comes out positive, a counselor should help the woman to understand and cope with her feelings. It might be happiness or shock, panic or excitement, or a mixture of different emotional reactions. It is also important to explore her support system and what options she has thought of.

Pregnancy Options Counseling

When facing pregnancy options, a woman needs accurate information on abortion, parenting, and/or adoption. If this is for medical reasons, she may need more medical information about the fetus and herself. The counseling session at this stage is usually seen as a crisis intervention. The client may need someone to listen to and help her calm down, clarify what would best suit her situation, and understand her ability and resources to cope with each option. Her partner or family members may also need similar help at this stage.

Preabortion Counseling

Before a woman has an abortion, she might see a counselor on the day of her procedure. She has usually deliberated on the decision. The counselor will explore how she has reached this point and feels about her decision; the level of psychological support she has received; conflicts she might have with her partner or family, beliefs, religion, or culture; and her concerns and fears about the procedure. The counselor can also empower her ability to handle some issues that might arise after the abortion.

Postabortion Counseling

Women who have abortions seldom seek counseling after the incident, and since this is confidential, neither would abortion providers call patients back to check if they are fine or not. However, there is a short time for counselors or medical staff to observe whether the woman shows any sign of emotional disturbance in the recovery room. She may feel relieved, physically uncomfortable, out of control emotionally because of the medicine she is given for pain relief, guilty, or sad. The topic of birth control is usually discussed at this point, and according to professional experience, most women are highly motivated and eager to receive related information. For those who are distressed by relationship problems, the counselor may consider giving them a local referral list of counseling providers or arrange adequate resources for the clients.

The conclusion is that abortion is a unique experience in human beings not only for women themselves but also for their partners or important family members. This is not just a medical procedure. It also has deep effects in human experiences and development pertaining to social, psychological, religious, political, ethical, and cultural issues. As a result, abortion is not only one of the medical services, but a multidisciplinary service including medical, psychological, legal, spiritual, and social fields.

Accidental Death

To die by accident is to experience a form of mortality that is unexpected, unplanned for, and unintentional. The key component to establishing a death as an accident is the absence of intentionality in its occurrence, namely, that the decedent did not intentionally act to produce a deadly outcome and that the deceased did not want to lose his or her life. Accidental death is one of the leading causes of deaths in the United States and is consistently ranked among the foremost causes of death worldwide.

According to Centers for Disease Control and Prevention (CDC) statistics, accidental mortality is the fifth leading cause of death in the United States, ranking behind heart disease, malignant neoplasms, cerebrovascular diseases, and chronic lower respiratory infections. Moreover, accidental death increasingly receives public safety and epidemiologic interventions directed at reducing its incidence. These efforts have resulted in public policies that require seat belts and airbags in automobiles, stiffer penalties for driving under the influence of alcohol, and the use of smoke detectors in public and private buildings. Because accidental death has consistently ranked in the top 10 leading causes of mortality over the past century, public health efforts at eliminating or reducing its occurrence have also led to the creation of some

noteworthy federal agencies such as the Occupational Safety and Health Administration since 1971, which aims to reduce work-related injuries and death; the Consumer Product Safety Commission since 1972, which strives to ensure the safety of consumer products; and the National Transportation Safety Board since 1967, which investigates transportation-related deaths and injuries and makes recommendations to improve the safety of the traveling public. In addition to these federal agencies, the lobbying efforts of social movements, such as Mothers Against Drunk Driving, which, since 1980, has worked to reduce alcohol-related motor vehicle injuries and fatalities, have played a major role in bringing alcohol-related injuries and deaths to the forefront of discussions on prevention efforts. Yet, despite the work of these organizations, accidental mortality has not risen to the same level of public awareness and concern as the other 15 leading causes of death in the United States, and this relates to the very conception of what an *accident* is.

In the collective consciousness, an accident is defined as something that occurs by chance or the result of fate—an event or an outcome that people have little, or no, control over. And the thanatological assumptions surrounding accidental deaths are entrenched in this line of thinking because nobody intentionally dies by mistake. That accidental deaths are seen as the result of fate, bad luck, unfortunate circumstance, or statistical probability may explain why public health efforts to educate and lower the risk of accidental mortality are not as entrenched in the collective conscience as are other campaigns intended to address the incidences of mortality from the other leading lifestyle-related causes. An accidental death, in the public's consciousness, is too often an unfortunate occurrence that was unforeseen and unanticipated, a mistake-related mortality.

Leading Types of Accidental Deaths

According to the Centers for Disease Control and Prevention (CDC), between the years 2000 and 2004, some of the leading causes of unintentional deaths for all age groups included motor vehicle accidents (214,434 deaths), poisonings (84,663), falls (80,540), unspecified accidents (33,134), suffocation (25,069), fire/burn (16,376), and drowning (16,376). Moreover, the CDC statistics on the occurrence of accidental death show that the risk of succumbing to unintentional mortality changes with different stages in a person's life. The accidental death risk for a toddler will be significantly different from that of a teenager's. Indeed, the leading cause of accidental deaths for children under age 1, according to the CDC, is unintentional suffocation, but between 1 and 3 years of age, it shifts to motor vehicle accidents. For adults over the age of 50, falls are the most prevalent cause of unintentional mortality. Furthermore, there were 108,694 accidental deaths in 2004, a figure that was higher than the 93,592 deaths in the year 2000, a near 14% increase in the number of unintentional deaths for this 5-year period, making unintentional death the leading cause of mortality for the first 40 years of life. However, it is important to remember that the age-adjusted accidental death rate per 100,000 people has actually fallen significantly over the past 4 decades in the United States, with 63.1 recorded accidental deaths per 100,000 individuals for the year 1960, compared to 37.7 deaths per 100,000 people for the year 2004.

Motor Vehicle Fatalities

The sheer number of unintentional traffic fatalities, an average of about 42,000 deaths per year since 2000, deserves special consideration above the other categories because it represents close to 40% of all accidental deaths. About 116 persons will die each day as a result of an automobile accident, a number that would be much higher but for advances in safety such as front and side airbags, seat belt restraints, antilock brakes, and stability control technologies. Indeed, although the contemporary automobile death rate is high, it is still below the historic peak in 1969, a time before the enactment of safety innovations and regulations. Nevertheless, the United States averages one traffic fatality every 12 minutes, and the demographic picture of traffic deaths show that being young and being male are the two most common risk factors that show up in fatality statistics.

Accidental death seems to be a universal corollary of "driving while young." In the year 2004, a total of 4,767 teenagers between the ages of 16 and 19 were killed in motor vehicle accidents, and

another 400,000 received injuries that required hospitalization, according to CDC statistics for 2006. In fact, accidental death in vehicle crashes is more likely to affect this age group than all others, and gender is, once again, a crucial variable in the data on motor vehicle fatalities.

The rate of death for teenage male drivers 16 to 19 years old was 1½ times greater than the death rate for their female cohort according to 2004 CDC statistics. Teenage male drivers are more likely to report risky driving behaviors, such as speeding, driving without seat belt use, and driving while under the influence of alcohol. In fact, the teenage motor vehicle death rate is so alarming that the National Transportation Safety Board now advocates the most austere policies for young drivers, including (a) graduated drivers license statutes, (b) laws restricting the use of communications devices while driving, and (c) laws setting limits on the number of passengers a teenage driver can transport. In addition to advocating for these teen-specific driving regulations, the National Transportation Safety Board would also like to see the adaptation of mandatory adult seat belt restraint and child occupancy laws in all 50 states and the universal adoption of the .08 blood alcohol standard for driving under the influence (DUI) infractions.

What the National Transportation Safety Board stratagem suggests is that most traffic fatalities are not the result of fate or back luck, but poor choices on the part of drivers. While all automobile accidents are the result of road or weather conditions, automobile mechanical failure, and/or problems with the driver, the *overwhelming* amount of traffic fatalities are caused by poor choices on the part of drivers. For example, the National Highway Traffic Safety Administration reports that intoxicated driving and excessive speeding account for close to 70% of all traffic fatalities nationwide. Moreover, of the 42,642 people killed in traffic accidents in 2006, 17,602, or 41%, were alcohol-related deaths. These statistics suggest that human error in decision making, in either driving while intoxicated or with excessive speeds, is the cause of most accidental deaths on U.S. roadways. That society still refers to these fatalities as "automobile accidents" seem to suggest a link between poor decision making and the lack of culpability in outcome. Because of this assumption, some policymakers and accident researchers now suggest the phrase "automobile collision" as a better moniker for what is *really* taking place on American highways.

Accidental Fall Deaths

Depending on the year of reported CDC mortality statistics, unintentional mortality by falling is either ranked as the second or third most common type of accidental death. Between 2000 and 2004, the total number of deaths by unintentional falls was 80,643, making it the third leading cause of unintentional mortality for this time period, behind unintentional poisoning and motor vehicle fatalities. The CDC reports that among adults 50 years and older, unintentional falls is the leading type of accidental death, with about 14,000 deaths per year for this age group. The elderly are acutely affected by this type of unintentional death because of morbidity factors (e.g., neuromuscular and musculoskeletal diseases such as Parkinson's disease and osteoporosis) that increase the likelihood of accidents. According to CDC statistics, the home is the most likely setting for falls, accounting for about 60% of all accidental falling deaths.

Gender and Accidental Deaths

CDC statistics on accidental deaths show a distinct gendered pattern in occurrence rates. Men are more likely to be the victims of accidental mortality in almost every category of accidental death. At younger ages, teenage boys are more likely to be the victims of automobile accidents and drowning—more than 1½ times more likely to be victims of motor vehicle fatalities and more than 3 times more likely to drown than are girls. Among adult unintentional poisoning deaths, men are 2 times more likely than women to be victims. Finally, among unintentional falling deaths between the years 2000 and 2004, males accounted for 53% of those deaths.

Social scientists attribute the disparity in accidental mortality between men and women to differences in the gender socialization boys and men receive into masculinity, where certain risk-taking behaviors and activities are normalized as part of the process of becoming a man. Also, men are more likely to participate in activities that involve greater levels of risk, such as excessive speeding and driving under the influence, and this tendency

accounts for the difference in accidental mortality between boys and girls, and men and women.

The Impact of Accidental Traffic Injuries and Fatalities: Economic and Psychological Costs

Automobile accidents are a ubiquitous and common occurrence that carries significant economic and social costs. In 1990, there were 6.4 million traffic accidents or crashes on U.S. highways, and there were 6.1 million in 2005. The National Highway Traffic Safety Administration estimates for the year 2000 put the total economic cost of all motor vehicle accidents, injuries, and fatalities at $230.6 billion, which includes lost productivity costs of $61 billion, property damage costs of $59 billion, and medical expenses at $32 billion.

The impact of motor vehicle accidental injuries and deaths is not just economic or social. There is a tremendous personal cost to the high rate of accidental death and injury by automobile. For example, in 2005, 101,034 Americans were involved in an automobile accident either as a driver or passenger in which a person was killed. In fact, motor vehicle injuries and fatalities are the leading cause of trauma for American males and the second leading cause of trauma for American females. Moreover, it is the most common cause of post-traumatic stress disorder, which presents itself in a host of postaccident psychiatric morbidities such as phobic avoidance of driving, depression, and increased anxiety. Epidemiological evidence from the American Psychological Association indicates that anywhere from 10% to 40% of Americans involved in a life-threatening or fatal automobile accident will develop post-traumatic stress disorder.

Accidental Death Issues

There are several conceptual problems surrounding the concept "accident" and "accidental death" in particular. An accident is something that is the result of pure chance, an outcome that was unexpected and unintentional. An accidental death is an unfortunate, unanticipated, and surprising event that no one can foresee. But this is a limited use of the concept of accidental death, especially when the vast majority of accidents are not really accidents of chance but rather accidents of folly, negligence, and blatant human misjudgment. One accident researcher cites that as much as 60% to 80% of all accidents might be the result of human errors. The National Highway Traffic Safety Administration reported that 41% of the 42,642 traffic deaths in 2006 were directly related to alcohol consumption and impaired driving. Can we really call these deaths *accidental deaths*? Many accident researchers argue that we cannot.

In one of the most important reports on the accident controversy, written in 1961, Suchman's *A Conceptual Analysis of the Accident Phenomenon*, a reevaluation of the way society conceptualizes life's unexpected events is suggested. By the criteria established at the time, an event must meet three necessary conditions and satisfy four qualifying assessments in order to be considered an accident. These three necessary conditions are (1) intentionality, (2) unavoidability, and (3) expectedness. The first, *intentionality*, is the most commonly used criterion, and one too often applied alone. The questions most frequently asked to ascertain intentionality are "Was it your intention to cause this accident?" and "Did the decedent intend to die?" *Unavoidability* relates to the degree to which the accident victim could have taken reasonable steps to avoid the occurrence. Finally, the degree of *expectedness* relates to the likelihood that the victim might have anticipated the outcome. In the case of aggressive driving and speeding, *expectedness* relates to the probability that one's action might cause an accident. But aside from these three factors, it is important to consider (1) the degree of warning that may have precipitated the event, such as admonitions against the perils of driving under the influence or excessive speeding; (2) the degree of negligence involved in the act that led to the accident; (3) the degree of an individual's misjudgment; and (4) the duration of the occurrence itself.

Finally, there is an unsettled debate in the literature on accidental death and injury concerning the issue of *accident proneness* and whether or not the phenomenon even exists. Studies on accident proneness—that is, the likelihood that personality traits and attitudes toward risk-taking behaviors might be factors in explaining higher rates of accidental deaths or injuries in certain groups or clusters of people—have been inconclusive and highly controversial. While the literature on accident

proneness suggests that there are some personality traits, such as youthful impulsivity and a penchant for sensation-seeking activities, that might explain differences in accidental rates between teenagers and adults and between men and women, there are also structural features that make this person-blame approach to accidents problematic, namely, that low socioeconomic status increases an individual's likelihood of experiencing an accidental death or injury, or that social and environmental factors, such as gender socialization, make it more acceptable for some groups to be risk-prone. Yet, despite debates on the accident proneness phenomenon, there is a psychological assessment commonly used to measure a person's proneness level: the Accident Proneness Test.

Classifying Accidents: Subintentional Behaviors, Equivocal Deaths, and the Psychological Autopsy

Some scholars argue that too often, suicides are classified as accidental deaths when there is no clear evidence to suggest intentionality, especially when the decedent leaves no indicator that might suggest suicide. There is also a class of subintentional actions that are self-destructive or reckless deeds that can hasten death or that can heighten the possibility of dying even if suicide is not the *intent* of these actions. Subintentional behaviors cover a wide range of actions from aggressive driving under the influence of alcohol, to free-wheeling drug abuse and addiction, to high-risk personal behaviors. In a subintentional death, the decedent may not have wanted to die but certainly knew that dying would be the natural outcome of his or her risky behavior. Whether or not subintentional deaths should be classified as accidents in part spurs on the contemporary debate over accidental mortality.

In 1973, Edwin Shneidman reasoned that anywhere from 10% to 15% of casualties were *equivocal deaths,* meaning that they could be classified as either suicides or accidents, but in most cases, they were likely to be classified as accidents. Many researchers believe that suicides are underreported and that many are included in accidental death statistics. To correctly classify unsuccessful parasuicides and deaths from subintentional acts, the psychological autopsy, an ex post facto investigative tool, was employed to investigate equivocal deaths, thereby facilitating the effort to correctly classify the death. The psychological autopsy also considers the degree of lethality involved in subintentional acts and parasuicide to provide an index of whether the intent of the act was suicide, the reasoning being that the greater the lethality of the method used, the more likely that suicide, and not a "cry for help," was the intent that underscored the act.

Finally, the current method of accounting for the prevalence of accidental deaths may be limited by the exclusion of entire categories of accidental mortality, such as iatrogenic and equivocal deaths.

Acute and Chronic Diseases

Historically the modal cause of death is disease. Diseases, also referred to as morbidities, are commonly classified into two categories: acute illness and chronic illness. Acute illness is characterized by sudden onset of symptoms and a brief duration. Examples include influenza and chicken pox. Most infectious diseases fall into this category. Acute illness may resolve on its own, may be treated with medications, or, in severe cases, may result in death. By contrast, chronic illness has a gradual onset of symptoms and an extended course. These types of illnesses usually result from degenerative conditions, traumas, lifestyle factors, or exposure to harmful environmental agents. Examples include diabetes, Alzheimer's disease, cancer, and most forms of heart disease. Although chronic illnesses are generally not curable, in many cases the sequelae of chronic conditions can be managed behaviorally or through medical intervention.

In 1900, the major causes of mortality in the United States were infectious diseases. The three leading causes of death were pneumonia and influenza, tuberculosis, and diarrheal diseases, respectively. The life expectancy at birth, in 1900, was 47.3 years; in contrast, a baby born in 2005 has a life expectancy of 77.8 years, an increase of more than 30 years. Much of the increase in life expectancy can be contributed to the changes in the major causes of mortality, with the leading causes of mortality shifting from acute illness to chronic illness.

In the United States and other more developed countries, acute illnesses have historically been important causes of death and have produced dramatic fluctuations in mortality; the Spanish flu epidemic of 1918 is one important example. More recently, however, with the life expectancy at birth reaching approximately 75 years for men and over 80 years for women, the primary source of death has shifted to chronic illness, especially heart disease and cancer. This entry summarizes the most common fatal chronic and acute illnesses in the United States, describes the historical shift from acute to chronic illnesses as the primary causes of death (epidemiological transition), and compares the level of chronic and acute illness in the United States to levels observed in other parts of the world.

Acute and Chronic Illness in the United States

According to a recent report by the National Center for Health Statistics, "Deaths: Final Data for 2005," there were 2,448,017 recorded deaths in the United States in 2005, resulting in a crude death rate of 825.9 deaths per 100,000 population. A more detailed view of recent mortality in the U.S. population can be obtained by examining specific causes of death. The 15 leading causes of death are shown in Table 1. Of the major causes of mortality in the United States, most are chronic in nature. The two major causes of death on this list—heart disease and cancer—accounted for almost half of all deaths (49.4%) in 2005, providing compelling testament to the monolithic role that chronic disease currently plays as a cause of mortality.

Heart Disease and Cancer

Most deaths from heart disease (almost 70%) are classified as ischemic heart disease (oxygen shortage that damages the heart muscle). Even when the effects of heart disease appear suddenly, as may be the case in a myocardial infarction or heart attack, the underlying cause usually involves long-term accumulation of arterial plaque, a hardening of the arterial blood vessels (atherosclerosis), or both. Although the heart is susceptible to infectious disease (as with some types of endocarditis and myocarditis), infectious disease accounts for less than 1% of heart disease deaths.

Although in some cases cancer can kill quickly, most types have an extended course. Advances in the treatment of cancer, using surgery, radiation

Table 1 The 15 Leading Causes of Death in the United States, 2005

Cause of Death	*Rank*	*Number*	*Percentage of Total Deaths*
Diseases of the Heart	1	652,091	26.6
Malignant Neoplasms (Cancer)	2	559,312	22.8
Cerebrovascular Diseases	3	143,579	5.9
Chronic Lower Respiratory Diseases	4	130,933	5.3
Accidents (Unintentional Injuries)	5	117,809	4.8
Diabetes Mellitus	6	75,119	3.1
Alzheimer's Disease	7	71,599	2.9
Influenza and Pneumonia	8	63,001	2.6
Nephritis, Nephrotic Syndrome, and Nephrosis	9	43,901	1.8
Septicemia	10	34,136	1.4
Intentional Self-Harm (Suicide)	11	32,637	1.3
Chronic Liver Disease and Cirrhosis	12	27,530	1.1
Essential (Primary) Hypertension and Hypertensive Renal Disease	13	24,902	1.0
Parkinson's Disease	14	19,544	0.8
Assault (Homicide)	15	18,124	0.7
All Other Causes	—	433,800	17.7

Source: From "Deaths: Final data for 2005," by H. C. Kung, D. L. Hoyert, J. Q. Xu, and S. L. Murphy, 2008, *National Vital Statistics Reports, 56*(10). Hyattsville, MD: National Center for Health Statistics.

therapy, chemotherapy treatment, and other methods, have extended survival time contributing to the chronic nature of this category of disease. The types of cancer that accounted for the most deaths in 2005 were (a) cancer of the trachea, bronchus, and lung; (b) cancer of the lymphoid and hematopoietic systems; (c) cancer of the rectum, colon, and anus; (d) breast cancer; and (e) pancreatic cancer. Together, cancer of these sites accounted for about 61% of all deaths from cancer.

Other chronic illnesses among the 15 leading causes of mortality include cerebrovascular disease, chronic lower respiratory disease, diabetes, Alzheimer's disease, chronic kidney diseases, chronic liver disease (including cirrhosis), hypertension, and Parkinson's disease. Together these illnesses accounted for 18.3% of deaths in the United States in 2005.

Acute Diseases

Even though chronic illnesses are the primary causes of mortality in the United States and in other industrialized countries, acute illnesses account for a significant number of deaths annually. Two infectious diseases appear among the top 15 causes of death. Influenza, along with pneumonia, accounted for 63,001 deaths in 2005, while septicemia (bacterial infection in the blood) accounted for 34,136 deaths that same year. Finally, the human immunodeficiency virus (HIV) claimed 12,543 lives in 2005. Although HIV/AIDS is a communicable illness, advances in medical management of HIV/AIDS have significantly increased the survival time; in many cases, HIV/AIDS resembles a chronic disease rather than an acute infectious illness.

Risk Factors

Age

The risk of chronic illness rises precipitously with age. The vast majority of older adults (65 years of age or older) living in the United States report at least one chronic condition, and roughly half of the older population reported two or more chronic conditions. Based on data from the 2005–2006 National Health Interview Study reported by the National Center for Health Statistics in 2008, the 10 most common chronic conditions suffered by older adults were hypertension (53.3%), arthritis (49.6%), heart disease (31.0%), cancer (21.2%), diabetes (18.1%), sinusitis (13.8%), ulcer (10.8%), asthma (10.6%), stroke (9.3%), and hay fever (7.5%). Although not all of these conditions are fatal, they can result in diminished functional ability and significant erosion of quality of life.

Sex

Examining group differences in chronic illness provides insight into the source of sex, race, and ethnic variation in overall mortality. Age-adjusted mortality for men was approximately 40% more than women's overall mortality. Specifically, men suffered higher mortality from 9 of the 13 diseases as shown in Table 1, namely, heart disease, cancer, chronic lower respiratory disease, diabetes, influenza/pneumonia, kidney disease, septicemia, liver disease, and Parkinson's disease. Women suffer higher mortality from only one of the leading causes of death: Alzheimer's disease. No differences in mortality were observed between males and females for cerebrovascular disease or primary/renal hypertension.

Race and Ethnicity

Age-adjusted mortality for African Americans is approximately 30% greater than that for whites. African Americans had higher mortality for 8 of the 15 leading causes of death, namely, heart disease, cancer, cerebrovascular disease, diabetes, influenza/pneumonia, kidney disease, septicemia, and primary/renal hypertension. For four of these illnesses—diabetes, septicemia, kidney disease, and primary/renal hypertension—the rates for African Americans are more than double that of whites. Whites, however have higher mortality from chronic lower respiratory disease, Alzheimer's disease, liver disease, and Parkinson's disease. Hispanics exhibit considerably lower mortality than non-Hispanic whites, approximately 30% lower among all of the major fatal illnesses except diabetes and liver disease.

The Epidemiological Transition

The shift in mortality and disease patterns (acute to chronic illnesses as the leading cause of death) is known as the epidemiological transition for which three stages have been identified: (1) the age of pestilence and famine; (2) the age of receding pandemics; (3) the age of degenerative and man-made diseases. The epidemiological transition is typified by a gradual replacement of pandemic infectious (acute) diseases by degenerative (chronic) diseases as the main types of morbidity and leading causes of mortality. The age of pestilence and famine is characterized by high rates of infectious disease and mortality and low life-expectancy rates at birth. The age of receding pandemics is distinguished by lower rates of mortality, gains in life expectancy at birth, and sustained population growth. The age of degenerative and man-made disease is exemplified by continued declines in mortality and an increase in life expectancy at birth to over 50 years of age. Along with all other more-developed countries, the United States has experienced an epidemiological transition: There has been a shift from acute illnesses to chronic illnesses as the major causes of mortality, and there have been increases in life expectancy.

Causes and Consequences of the Epidemiological Transition

The primary reasons for the epidemiology transition in the United States include a rise in the overall standard of living, advancements in medical care, and improved public health measures. Throughout the 19th and 20th centuries the United States underwent an overall rise in the standard of living, based in large part on enhanced diet and adequate shelter, which greatly shaped rates of U.S. morbidity and mortality. Following the rise in the standard of living, the United States benefited from further advancements in medical care and

improved public health measures, such as superior water and sewage treatment.

The consequences of the epidemiological transition in the United States are easily demonstrated. Because declines in mortality preceded declines in fertility, the size of the U.S. population has grown dramatically. Falling mortality rates have also increased the average life span, dramatically increasing the number of Americans living to older ages. As the U.S. population ages, there is a greater prevalence of chronic illness and disability. To manage the changing health demands of an aging U.S. population, health care costs have sharply risen over the past several decades.

Although the United States adheres to the classic epidemiological transition model, the Spanish flu pandemic of 1918 illustrates the variability of infectious diseases. During the early 20th century the United States was arguably experiencing the second stage (the age of receding pandemics) of the epidemiological transition, yet the Spanish flu pandemic of 1918 affected nearly a quarter of the U.S. population and had a high mortality rate. Recently, infectious diseases have come to the forefront of media attention, and researchers are discussing a reemergence of infectious diseases such as AIDS and stronger strains of classic diseases such as tuberculosis, pneumonia, and influenza. There is evidence to suggest that infectious diseases will assume increasing importance in the future.

Acute and Chronic Illness in Global Perspective

The major causes of mortality for developed nations differ from those in developing nations. As reported by the World Health Organization, the leading causes of mortality for high-income countries are chronic illnesses such as coronary heart disease, stroke and other cerebrovascular diseases, and lung cancer. However, in low-income countries the leading causes of mortality are a mixture of chronic and acute illnesses. To illustrate, the top three leading causes of death in 2002 for low-income countries were coronary heart disease, lower respiratory, and HIV/AIDS. Such patterns of disease and health vary from nation to nation due to different socioeconomic statuses, cultures, environments, and demographic and technological changes.

In general, developing nations do not fit the classic or Western epidemiological transition as well as has been observed among the developed nations. Because of recurring aberrations the model was refined to explain the variants to the classic epidemiological transition. Thus, two models, building on the classic epidemiological transition model, are (1) the accelerated model and (2) the delayed model. The accelerated model, associated with Japan and Eastern Europe, is characterized by rapid decline in fertility and mortality rates, while the delayed model is typically associated with the poorer nations or developing nations that have maintained high rates of infectious diseases and, in turn, low life expectancy.

The differences observed in the patterns of disease and causes of mortality observed among the developing nation states are quite dramatic. Latin America provides an excellent example of the differences among developing nations in reference to the epidemiological transition. Guatemala is experiencing a delayed transition, with high rates of mortality due to acute illnesses and low rates of mortality due to chronic illnesses; in contrast, Mexico has high rates of mortality due to both acute and chronic illnesses. The differences between Guatemala and Mexico can largely be attributed to the differences in modernization level. Modernization influences the pattern of disease because it affects a nation's standard of living, public health, and medical care. As developing nations continue to see increases in living standard and public health measures, the global burden of chronic illness will also increase.

Chronic Disease in Developing Nations

The global burden of chronic illness in developing nations has been relatively unrecognized because acute illnesses kill at higher rates; however, the contribution of chronic illness, such as cardiovascular disease, from developing nations to the overall global burden of chronic illness is significant. Developing nations, which already must manage acute illnesses, face a "double burden" from the added incidence and prevalence of chronic illness. Some researchers have postulated that the increased rates of chronic illness in developing nations can be partially attributed to the effects of

globalization on lifestyle factors such as tobacco use and dietary changes.

Chronic illness is a global concern for both developed and developing nations, but the reemergence of infectious diseases has garnered international media attention. The recent outbreak of avian flu has raised concerns about a possible avian flu pandemic in the future. Many researchers see the outbreak of avian flu as evidence that a new stage of epidemiological transition may be under way, namely, the age of emerging and reemerging infectious disease. As infectious diseases, such as avian influenza and sudden acute respiratory syndrome (SARS), continue to make their presence known both domestically and internationally, it is not yet clear how these infectious diseases will impact the health of both developed and developing nations.

Adolescence and Death

Developmental tasks and transitions influence how adolescents face mortality, and experiences with mortality very likely influence how adolescents deal with the transitions and tasks that society expects them to complete. An early influence on developmental understandings of adolescence was provided by Peter Blos, whose notions of early, middle, and late adolescence phases of development revolve around identity formation and ego integrity. Although there is no uniformity on the age ranges that encompass early, middle, and late adolescence, it is understood that (a) adolescence involves more than the teenage years, (b) adolescence begins with puberty, and (c) a convenient U.S. marker for early, middle, and late adolescence is schooling: Early adolescents are junior high or middle school students (~10–14 years old), middle adolescents are high school students (~15–18 years old), and late adolescents are traditional-age college students (~19–22 years old).

The developmental push for achieving identity integration focuses, in early adolescence, on separating emotionally from parents; in middle adolescence, on developing a sense of proficiency or mastery; and in late adolescence, on entering into and maintaining intimate interpersonal relationships. Consider, for instance, the complexity facing a 13-year-old early adolescent whose struggle to achieve emotional separation from her parents is embedded in the unexpected death of her father from a heart attack. Some empirical evidence, longitudinal and cross-sectional, suggests that adolescents facing life crises over deaths of family members or friends become more mature than same-aged, nonaffected peers. Cascading effects of bereavement on adolescents can be seen prominently in the

impact on academic pursuits. High school and college students' grades in the first few months of bereavement suffer, and even retention in college can be affected.

There is widespread attention to changes in cognitive development that enable older children and adolescents to attain what is considered a mature understanding of death. People who grasp that death is (a) irreversible, (b) happens to all living organisms, (c) can result from internal or external causes, and (d) produces the end of bodily functions are said to possess a mature understanding of death. Remarks that death leads to a life after death are typically dismissed as indicative of an immature concept of death, despite the fact that the great majority of adults, at least in the United States, hold such a view. There is growing awareness, as well, that many adults struggle with a mature understanding of death when faced with the death of someone loved.

Ambiguity colors individual adolescents' acceptance that mortality applies to them. The source of this ambiguity is a twofold form of adolescent egocentrism, or what has been identified as mistaken inferences about individual uniqueness (a "personal fable") and as narcissistic expectations about others' awareness of one's existence (an "imaginary audience"). This ambiguity about the universality of death is sometimes described as a belief in invulnerability, but recent research into developmental neuroscience raises serious doubt about adolescents' having delusions of invulnerability. It is doubtful that adolescents threatened with imminent death (e.g., realizing the car in which they are driving is going to hit another vehicle head on) dismiss the prospect that death applies to them; further, it is doubtful that adolescents from ethnic or racial groups at significant risk of homicide dismiss the likelihood that death can happen to them.

Adolescent Mortality

Although adolescents die from a variety of causes, the three major reasons are accidents, homicide, and suicide. Life-threatening illnesses do take the lives of adolescents, but deaths from cancers, diabetes, or heart disease, for instance, are considerably more prevalent later in the life span. The World Health Organization has published concerns that rites of passage within adolescent subcultures place adolescents at risk of death: These rites of passage include behaviors such as binge drinking, sexual promiscuity, drunk driving, and violence. Throughout the world, with the obvious exception of death due to pregnancy complications, adolescent males are at much higher risk of mortality than are adolescent females.

Deaths Due to Accidents

Mortality statistics reported by the World Health Organization underscore the fact accidents comprise the largest plurality of deaths during adolescence. Such statistics apply whether the adolescents live in developed or developing countries. For instance, deaths due to accidents comprise approximately 46% of deaths of adolescents in Australia, France, and the United States, and approximately 37% of deaths of adolescents in Mexico, the Ukraine, and Belarus. Vehicular accidents typically are the major cause of adolescents' accidental deaths.

Deaths Due to Murder

According to the World Health Organization, homicide is a leading cause of death for African American adolescents and for adolescents in El Salvador, Brazil, and Russia; homicides account for approximately 35.5% of adolescent deaths in those countries. Among developed countries, only in the United States does homicide form a leading cause of death for adolescents. In the United States, homicides account for approximately 16% of adolescent mortality, whereas in countries such as Australia, Canada, and France, homicides account for approximately 2% of all adolescent deaths.

Deaths Due to Suicide

Suicide is the second leading cause of death for adolescents around the world, and international data indicate the adolescent suicide rate has increased exponentially: The number of completed suicides has increased 60% since the 1950s, and the number of suicides completed daily extends from 5.4 in Japan to 20.8 in Russia. In the United States, there are on average 11 adolescent suicides a day. In approximately one third of all nations, adolescents are the age group most at risk of

taking their own lives. In all countries males complete suicide much more often than do females, a phenomenon attributed to the highly lethal means males typically choose in contrast to the less lethal means typically favored by females (e.g., the use of firearms or hanging versus a drug overdose).

Deaths Due to Life-Threatening Illnesses

Illnesses seemingly endemic to adults do strike some adolescents, and thus there are incidents around the world of adolescent deaths due to malignant neoplasms, leukemia, diabetes, heart disease, and circulatory problems. The mortality rate of such deaths comprises approximately 16% of all adolescent deaths worldwide. Percentages of adolescent deaths due to fatal illnesses in 2000 include Australia (16.7%), Canada (13.9%), Cuba (22.4%), France, (15.8%), Russia, (14.3%), the United Kingdom (20.3%), and the United States (15.6%).

Adolescent Bereavement Due to Deaths

Diverse studies suggest that bereavement is a much more common experience for adolescents than previously believed. Many high school students are bereaved, and up to 20% have witnessed someone's death. Convenience samples on several college campuses indicate that 22% to 30% of students are within the first year of grieving the death of a family member or friend.

Bereavement researchers have concentrated primarily on adolescents' responses to the deaths of parents and to the deaths of siblings. Scant attention has been paid to the adolescents' responses to the deaths of friends, grandparents, or pets.

Adolescent Bereavement Over Parental Death

Two major research programs that examined adolescent bereavement following the death of a parent were conducted at Massachusetts General Hospital by William Worden and Phyllis Silverman and at Arizona State University by Irwin Sandler. These carefully designed longitudinal studies reported that the death of a parent fundamentally challenged the adolescents' reliance on predictability of events, leading them to be more anxious and fearful over time in contrast to adolescents not touched by parental death. Coping with parental death adversely impacted adolescents' interpersonal relations, posing a major obstacle to adolescents' developing a sense of belonging among peers. Adolescents in the Massachusetts study thought of themselves as being more mature than those peers who had not coped with the death of a parent.

The authors of both research projects reported that consistent, effective parenting greatly assisted bereaved adolescents to cope with their bereavement and subsequent negative events. The Arizona State University researchers operationalized positive parenting in terms of parental warmth and consistent discipline, reporting evidence that positive parenting provided a buffer against the onset of mental health difficulties. Girls, in particular, demonstrated positive outcomes to consistent, effective parenting; without such parenting, bereaved girls had notable problems handling negative life events.

Adolescent Bereavement Over Sibling Death

Scholarly research on adolescent bereavement began in the early 1980s, focusing initially on self-concept and emotions. For instance, the Offer Self-Image Questionnaire for Adolescents (OSIQ) was used to assess bereaved adolescents' self-concepts. On most subscales the bereaved adolescents' responses to the OSIQ are no different than the responses of normal teenagers; on the morals subscale, bereaved adolescents' responses were one standard deviation higher than the scores of normal teenagers, suggesting that coping with sibling bereavement had sensitized adolescents to develop a more mature understanding of moral quandaries. These findings led to conclusions that sibling bereavement may not adversely affect adolescents' growth in self-understanding but may actually impel growth in some arenas.

The extent of family communication about matters of significance and extent of emotional closeness to members of the family (termed *family coherency*) significantly differentiate bereaved siblings' recollections of their emotions in the first few months after the death and their current emotions about the death. Adolescents who characterized their families as having "greater coherency" said their emotional reactions in the first few months after the death were filled with confusion, guilt, loneliness, sadness, and fear. Over time open

discussions occurred within their families about their sibling's death; while they currently felt an enduring sadness, they had resolved their other emotional reactions and, in particular, felt no guilt or confusion about the death.

However, adolescents who said "less coherency" described their families said their initial emotional reactions to their siblings' deaths were primarily feelings of anger and guilt; over time their confusion increased, as did their fear and loneliness, and their anger had not lessened. Families with greater coherency provided adolescents a network for working through problems over the death by using the family as a communication and emotional resource. Less coherency left bereaved adolescents and their family members isolated from one another and ruled out the family as a resource for addressing practical issues, such as the reasons the sibling died, and personal issues, such as feelings elicited by the death.

A valid, reliable instrument titled the Hogan Sibling Inventory of Bereavement (HSIB) is useful for gathering data on adolescent sibling bereavement; this instrument provides information about grief and about self-concept. When mothers and fathers were asked to complete the HSIB as they thought their adolescent had completed it and the responses of mothers, fathers, and adolescents were analyzed, it was clear that mothers and fathers had significantly different perceptions of their adolescents: The mothers considered their adolescents' grief to be more problematic than did the fathers, and the mothers believed their adolescents' self-concepts were more mature than did the fathers. The parents' HSIB scores were compared to the scores of the adolescents, and against all expectations found in the literature the fathers' and the adolescents' scores were in substantial agreement, whereas the mothers' scores differed significantly from what the adolescents reported.

Adolescents' HSIB scores of self-concept and of bereavement intensity show an inverse relationship. In short, over time adolescents with low self-concept scores had high bereavement intensity scores, and adolescents with high self-concept scores had low bereavement intensity scores. The inference is that adolescents with low self-concept are at risk of long-term negative consequences. This finding has even greater salience when juxtaposed with the expectation that adolescents will develop a sense of mastery and control, suggesting long-term issues with persistence and confidence as bereaved siblings with low self-concept enter adulthood.

Adulthood and Death

Death is an integral part of life throughout adulthood. Psychologist Carl Jung proposed that adult development is characterized by a process whereby one moves from the omnipotence and immortality

of young adulthood to the confrontation of physical aging and loss of loved ones characteristic of middle and late adulthood. The leading causes of death, as well as the most common types of losses experienced, are defining features of each stage of adulthood.

Young Adulthood

Leading Causes of Death During Young Adulthood

Young adults benefit from excellent physical health and low rates of life-threatening illnesses. All combined, accidents such as falls, motor vehicle accidents, and poisonings are the leading cause of death during early adulthood. Homicide and suicide follow accidental death in frequency, with homicide being more common among young adults under age 25. Homicide is also the leading cause of death among young black men living in urban settings. Suicide is the second leading cause of death among 25- to 34-year-olds and the third leading cause of death among 15- to 24-year-olds. Cancer and heart disease are the fourth and fifth most common causes of death in young adults, respectively, and increase in frequency during the later years of young adulthood. Finally, HIV is the leading cause of death among young adults over the age of 25 who live in cities with populations of 100,000, is the fourth leading cause of death among black men, and is the third leading cause of death among young black women.

Common Deaths Grieved by Young Adults

Death of Grandparents

The death of grandparents is often the first significant death that young adults face, and although the loss of a grandparent may be quite painful, grandparent deaths are often anticipated and do not seem out of the natural order of events. Additionally, their deaths do not usually cause upheaval in carrying out the daily routines or normative developmental tasks of most young adults.

Death of a Child

The literature describes the death of a child as the most difficult and painful death to grieve because it violates all assumptions about the natural order of life and death; namely, that parents should not outlive their children. When a child dies, a parent loses not only their child but also their hopes and dreams for the future and often their sense of a just world. Starting a family is one of the primary developmental tasks of young adults, and even though the average age at which women bear children has increased over the past 3 decades in the United States, most babies are born to young adults. Accordingly, most early childhood deaths affect young parents at a time they are most invulnerable and have had little experience coping with death, particularly one judged to be so untimely and unfair.

Prenatal Death

Of the approximately 6 million pregnancies that occur each year in the United States, 2 million end in pregnancy loss as a result of miscarriage, ectopic pregnancies, molar pregnancies, stillbirth, and abortion. Although the medical recovery from the loss of a pregnancy is usually rapid and uneventful, the psychological effects can be traumatic. Unfortunately, the death of a preterm baby is often minimized and not adequately validated as a significant and profound loss.

One third of all abortions occur among women in their early 20s. Despite the voluntary nature of abortion, researchers report many women experience significant, and sometimes lifelong, abortion-related grief.

Death of Friends

Six to 10 million Americans are affected each year by the death of a friend. While all adults experience the death of friends, young adults have had less experience with death overall and their friends are vitally important sources of social support. Delaying marriage until the late 20s to mid-30s has increased reliance on friends while one forges an independent adult life. Perhaps because of their lack of death-related experience and a sense of immortality, young adults are at risk for experiencing complicated grief following the loss of a friend, particularly when the death is unanticipated, violent, or both. Moreover, friends are frequently overlooked as legitimate grievers because society often acknowledges and validates only the grief of families.

Middle Adulthood

Leading Causes of Death During Middle Adulthood

Degenerative diseases account for the majority of deaths during middle age. Heart disease and cancer combined account for roughly 60% of all deaths during middle adulthood. Accidents, chronic obstructive pulmonary diseases, liver disease, and stroke also are common causes of death among middle-aged adults.

Common Deaths Experienced by Middle-Aged Adults

Death of Parents

One of the most defining events of adulthood is the death of parents. Due to increased life spans, most middle-aged children now experience the death of their mothers between the ages of 45 and 64 and the death of their fathers between ages 35 and 54. Death of an elderly parent is viewed by many as normal, to be expected. Yet, even if parental death is predictable, most adult children are not prepared for it and often describe themselves as feeling orphaned. Furthermore, regardless of the historical nature of the parent–child relationship, the death of one's parents removes the buffer that shields them from death. Ultimately, the illusion of personal immortality so common during young adulthood is shattered by parental death, and the midlife developmental task of coming to terms with one's personal mortality commences.

Death of Spouse

Spousal death is less common during middle age than late adulthood, but middle-aged widows and widowers are often at greater risk of physical, social, and emotional problems, as well as higher mortality than their nonwidowed elderly counterparts. This heightened risk of negative outcomes may be attributed to the fact that middle-aged widowers often lack the level of social support experienced by elderly widowers who are likely to know more widows and widowers. And because of increased delays in childbearing in the United States in particular, many middle-aged widowers struggle with childrearing responsibilities, full-time work, singlehood, and often a significant decline in standard of living, all while trying to cope with the death of their life partner.

Late Adulthood

The elderly comprise less than 25% of the U.S. population but account for approximately 75% of all deaths recorded annually. Although fear of death declines with age, deaths of loved ones occur much more frequently in late adulthood, resulting in cumulative grief. Each loss serves as a poignant reminder of one's mortality and the inevitable deaths of more loved ones in the future.

The leading causes of death among the elderly are chronic diseases: heart disease, cancer, stroke, obstructive pulmonary diseases, and dementias as well as acute conditions such as pneumonia and influenza. Suicide is another cause of death among the elderly. In fact, the suicide attempt/completion rate of 4:1 is higher than the attempt/completion rate of 8:1 to 15:1 for younger age groups, resulting in a rate of suicide that is higher for white men over the age of 65 than for any other age group, including teenagers.

Common Deaths Experienced by Elders

Death of Spouse

More than 50% of all women over the age of 55 and at least 70% over the age of 75 are widowed. Although widows outnumber widowers by a 6:1 ratio, most widowers remarry, particularly those under the age of 75; many elderly widows do not. Again, the death of a spouse constitutes the loss of one's primary friend, companion, and lover, as well as secondary losses that include income, social invitations and connections, and assistance with household tasks. However, elderly spouses often provide essential health and physical support for their partners, and when they die, the surviving spouse may not be able to live independently. Finally, although depression and anxiety often increase following the death of a spouse, spousal caregivers may also experience a sense of relief and freedom following the death of their elderly spouse.

Death of an Adult Child

As average life expectancy has increased over the past century, so too has the likelihood of an elder experiencing the death of an adult child. The

death of a child is cause for disruption of the natural order of life. For elders there is the added loss of essential social, emotional, and physical support even as one's own health declines. Many elders expect that their adult children will help care for them in their old age and if the child dies, elders face pain and grief over the loss of their child as well as experiencing fear for their own future care.

Death of Siblings

Siblings are the keepers of one's history. Indeed, siblings have the potential to know and share one's entire life story from birth to old age. Even if one has not been emotionally and/or physically close to a sibling who dies, there is still the loss of a constant with the sibling's death. Such loss is profound and omnipresent and yet often goes unrecognized by others.

Death of Friends

Friendships in old age are related to life satisfaction, quality well-being, and life enhancement; many elders view their friends as their most important confidants. Accordingly, the loss of friends during old age poses a significant challenge to the relational and emotional aspects of elders' lives. The death of friends and family members may result in increased social isolation and lack of needed support. However, unlike the disenfranchising experience that many younger and middle-aged adults face when a friend dies, because some friendships in old age span decades, elder friends are often afforded significant consideration by the deceased friend's family.

Finally, adults must learn to cope with necessary losses. Coping with the death of loved ones, as well as contemplating and learning to live with one's own finitude, remain core developmental adulthood tasks.

African Beliefs and Traditions

Most African people regard death with great reverence and awe. Researchers and practitioners in death care have observed that in the study of cross-cultural differences, considerations of culture/subculture, spirituality/religion, and social class are important factors that influence attitudes, beliefs, and values in death, dying, and funeral rites. Cross-cultural research reports that factors such as social class and spirituality are important in explaining the range and diversity of beliefs, values, and practices observed among African people.

Africa is a vast continent with considerable diversity among its people. A number of distinctive cultural traditions concerning births and deaths have been observed across its various subcultures, societies, and tribes. Many Africans observe and identify with a variety of spiritual beliefs and many of their attitudes, beliefs, and values about life and death are aligned with their spiritual beliefs. For example, although many West Africans subscribe to elaborate funerals, West African Muslims have

characteristic beliefs about death care, postmortems, and preparation of remains, including simple funerals with a dignified burial. In addition, the socioeconomic status is of significant influence in that the wealthy are more likely to embalm and invest in metal caskets while the less affluent are more likely to forgo embalming and use simple wood carved caskets. Such differences exist among many African tribes.

African Views on the Origin of Death

Like most people, Africans have many enduring curiosities and beliefs about the origin of death. One such African myth regards death as a spirit that grants a "gift of escape" from the suffering of the physical world. Another of the oldest and most enduring accounts about the origin of death is referenced in the ancient folklore of the Asante of West Africa. According to folklore, there was a time when people experiencing death petitioned God to stop death. The request was granted, and for the next 3 years no one died and no children were born. The people again petitioned God to have children even if it also meant accepting death. This ancient African folklore illustrates the African worldview that life and death are complementary—a view of life and death as cyclical with death viewed as a part of this cycle.

African death superstitions evolve into practices and customs based on insecurities and fears about death. One African tribe has a custom of removing the dead body through a hole in the wall of the house instead of the door. This is done to make it difficult for the dead person's spirit to remember and find its way back to haunt and disturb the family. Likewise, many enduring intricate African funeral rites are believed to be essential to honor and to place loved ones at rest. According to African beliefs, by executing these funeral rites the survivors minimize the chances of wandering spirits returning to disturb those left behind. Many such funeral customs and practices of death care are based on mythology and superstition about death.

But despite the considerable diversity among African people, some commonalities and distinctive cultural markers can be identified as these are based on shared attitudes toward death, dying, and funeral rites.

Death as a Part of Life

The ancient Asante folklore about the origin of death reflects a belief about death—namely that death is a part of the natural rhythm of life. One enduring belief is that the death of an elder within a family and community is followed with a birth. The cyclical view of life regards death as a natural part of life and that each birth constitutes a renewal of life and community. Consistent with this belief, the ancient ritual of passing babies over the casket of a deceased elder is a way of honoring the elder and also honoring the life and death connection that is so important to family and community.

In many African societies and tribes, the symbol of the circle is a recurring theme in art. Ritualistic symbolism in sacred art and other artifacts represents renewal. Among the Asante the symbol of the Ankh is a large circle with a small cross that symbolizes life, fertility, and the renewal of life. The circle is also common in the design and representation of many other similar artifacts that are associated with life and well-being, referred to as fetishes or ancestor figures. This symbol closely resembles a similar artifact observed to exist in ancient Egyptian culture representing life, fertility, and the renewal of life.

Belief in the Afterlife

In Africa there is a commonly shared belief in a life following death. Accordingly, the individual dies and joins the community of ancestors, thereafter residing in the spirit world and afterlife. Many African cultural artifacts, such as art, music, sayings, superstitions, and traditions, reflect this belief in the numerous references made to joining loved ones who have died and progressed to the afterlife. For many people of African descent, the reference to funerals as "homegoing services" exemplifies more than disposal of the remains; such rites serve as a celebration of the deceased passing on to the spirit world. Africans residing in the Sea Islands, Angola, and Sierra Leone share these beliefs.

Similarly, it is common among many people of African descent to speak of the dying person "making his or her transition" from the material world to the spirit world and afterlife. Thus, religious orientations influence beliefs about heaven and hell

and how one's earthly existence influences the consequences or rewards and punishment in the afterlife and ideas relating to reincarnation. The Nguni of South Africa routinely slaughter an ox as a part of their funeral custom. The Nguni then refer to the ox as "the returning ox," which is believed to play an important role in accompanying the deceased in the journey home in the afterlife.

Funerals as "Primary Rituals"

In the African religious worldview, death represents a transitional stage in life that requires a passage rite. West Africans especially are noted for their thorough execution of funerals. Many West African tribes, such as the Asante, Ga, Fanti, and the Akan, have funeral rites and practices that are traceable back for thousands of years. Many of these African subgroups invest considerable amounts of resources and energy in the execution of funeral rites for the dead. Among the West African Asante, for example, funerals are elaborate and command more investments than most other rites such as weddings. The more esteemed and higher the individual's social status is within the community, the more elaborate and extensive the funeral rites will be.

According to African tradition, the immediate survivors have the primary responsibility and duty to assure that loved ones are given a "correct" funeral, incorporating aspects of the cultural and spiritual traditions to ensure the spirit of the loved one may find its resting place in the afterlife. Many Africans believe that if a funeral is conducted properly the loved one's spirit may wander, thereby causing misery and suffering for the survivors. Increasingly there has evolved an expectation among many West Africans to hold elaborate and often costly funerals leading in turn to social pressure to conform. Therefore, these expectations evolve into customary practices and ultimately traditions in many parts of African societies including African people who migrate. To not respond to this expectation is to experience feelings of shame and be viewed with dishonor.

Communal Grieving

Most African funerals are communal, with considerable value placed on community participation. In addition to family members, other community members often are involved in funeral rites and it is customary for them to express condolences. According to the cultural tradition of the West African Asante, for example, a strong sense of obligation generates condolences and financial contributions to assist in paying for funeral expenses. Indeed, many activities such as the sit-up, wake, and funeral represent social occasions that reaffirm social relations, solidarity, and group identity.

Ground Burials for Final Disposition

Most Africans prefer ground burial over other types of final disposition of human remains, but considerable variation exists in this practice, including the positioning of the grave, the individuals who participate in the preparations for burials, and the cost for burial ceremonies and the grave site. But there is also an increasing acceptance of cremation and other forms of final disposition in response to rising economic costs of traditional funerals. In addition, Muslim Africans believe in the simplicity of funerals and burials, which are primarily handled by males to include a simple grave with the remains simply placed in the ground facing east toward Mecca.

Many regional and ecological differences among African people also are impacting the rates of dying, death, and death care. In regions of East and South Africa, the realities of political instability and ethnic strife fuel ethnic conflict and soaring death rates. In addition, the rates of HIV/AIDS–related deaths are decimating many regions in epidemic proportion; such loss of human life burdens the survivors and the young with untold challenges. It remains to be seen whether the effects of the AIDS epidemic will also impact unique cultural aspects of dying, death, and bereavement in these regions.

After-Death Communication

After-death communication (ADC) is a spontaneous experience among people who have a feeling or sense of contact with a deceased person. ADCs are common and occur across culture, race, age, socioeconomic status, educational level, and religious belief. In the study of death and the human experience, reports of ADCs naturally occur. When they feel safe in doing so, people spontaneously share their ADC experiences when talking about their relationships with their deceased loved ones, their grieving process, or both. The study of ADCs falls under several disciplines: paranormal psychology, grief and bereavement therapy, religion and spirituality, anthropology, sociology, philosophy, and medicine. ADCs are frequently reported as being comforting, pleasant, and life-enhancing. Some people have described their experiences as unpleasant or frightening; however, the unpleasantness is thought to be a result of people having difficulty integrating these experiences into their lives. Despite the common nature of ADCs, they go largely underreported due to percipients' fear of being ridiculed or being thought insane. In the following discussion the topics focus on the history, incidence, characteristics, and types of ADCs.

History

Encounters with the deceased or ADCs have been reported in many cultures. Formal research dates back as early as the 1890s with the Census of Hallucinations conducted by the Society for Psychical Research. Researchers from the Society for Psychical Research found that hallucinations of deceased persons were common among the sane. Researchers in the field of paranormal psychology have typically led the way in the exploration of ADC as a common, normal human experience. At the time of the census study, these experiences were called "hallucinations of the sane" to indicate how encounters with the deceased were common among the general population. Also inherent in the census study was the assumption that these types of experiences are not merely a result of a yearning on the part of a grieving person; the ADC percipient may or may not be grieving. According to reports from the census study, some people actually had an encounter with a deceased person who was not known to them as being deceased. These ADCs are interesting because they debunk the theory that ADCs are just a result of bereaved people imagining they see their loved one out of desperation and intense longing. Since the census study was conducted, people have continued to report experiencing an ADC without knowledge of the deceased person's death.

During the 1960s and 1970s, researchers who studied widows and widowers began noticing the experience of "hallucinations" as a common characteristic of grief. Initially these experiences were thought to be a result of people's intense longing for the deceased and difficulty facing the reality of their loved one's death. However, it became clear that these experiences were beneficial and comforting for many of those grieving and that the people having them were very much in touch with reality. Many researchers and bereavement experts expressed surprise at such an experience occurring to people deemed psychologically stable and fully aware of the deceased's death. Later, as a result of

these spontaneous findings, researchers began inquiring into this phenomenon.

Since the Census of Hallucinations study in the 1890s, encounters with the deceased have been referred to as the following: hallucinations, illusions, apparitions, sense of presence, contact with the dead, postdeath contact, and others. Bill Guggenheim and Judy Guggenheim coined the term *after-death communication* in the 1980s. Over the course of 7 years, they conducted the ADC Project during which time more than 3,300 firsthand accounts of ADCs were collected through interviewing 2,000 people from the United States and Canada.

The 1980s and 1990s marked a transition time between researchers reporting contact with the deceased as a side note to inquiring about its frequency, characteristics, and benefits. In the 1980s, researchers included the question, "Have you ever felt as though you were really in touch with someone who died?" in their Multinational World Value Survey and found the experience common among people from many countries.

Incidence

Researchers from various fields have contributed roughly 35 studies addressing the occurrence of ADCs. Based on these studies, the incidence ranges from 2% to 100% of subjects having an ADC experience. Results from an American survey conducted in the 1980s indicated that 42% of the American adult population reported having contact with the dead, and 67% of the widowed population reported having the experience. In general, the incidence for the widowed population is higher than that of the general population. Researchers reported results from the Multinational World Value Study in which close to 20,000 people were surveyed from the United States, South Korea, and numerous countries in Western Europe. The incidence of ADCs ranged from 9% in Norway and Denmark to 41% in Iceland.

The incidence of ADCs is difficult to report given the variation in types of studies, the specific terms used to describe the experience, the exact question(s) asked, and the measurement of response. Given the synthesis of the studies, a conservative estimate of the incidence of ADCs is 45% of the general population reporting having had this experience. The actual incidence of occurrence could easily be higher than that figure given percipients' reticence to report these experiences, especially to helping professionals.

Characteristics

Many people have described ADCs as a spiritual experience, but ADCs have also occurred among those without strong religious or spiritual beliefs. Even among those who report having strong religious convictions, some report the experience as not fitting in with their religious beliefs. There seems to be an element of surprise in these experiences. Often people have recounted learning of information via the ADC they could not have otherwise known and that was later verified. Many self-proclaimed skeptics have written about their ADC experiences, and they tend to lend a sense of veracity to the phenomenon given their resistance to believing that such an experience can occur.

Those having ADCs typically report having the communication with a deceased friend or loved one. What seems to be the most common message in these experiences is that the deceased person is "okay." Often people report that during the ADC experience, the deceased person seems happy, healthy, and strong. Percipients report feeling relieved and encouraged by the message or interaction. Many have even reported being instructed by the deceased person to move on, forgive, heal current relationships, take care of those who are still alive, and possibly even to not give up. Some people have reported having an ADC experience when in the midst of contemplating suicide and described the experience as deterring them from acting on their suicidal urges. Others have reported having an ADC experience at precisely a time in which they needed safeguarding. In these ADCs for protection, people received warnings that helped protect them or their loved ones from motor vehicle accidents, house fires, undiagnosed health problems, harm from criminals, and other dangers.

Having ADCs are not always about communicating with a friend or loved one. Researchers describe how a group of emergency service workers experienced a sense of communication with fatal injury victims whom they had attended at death. These personnel were deemed to be psychologically sound as well as respected and experienced professionals in their field.

Types of ADCs

ADC experiences can occur as the following types: sensing a presence, hearing a voice, feeling a touch, smelling a fragrance, seeing an appearance, and having a dream ADC. Also common are ADCs of physical phenomena, including incidents such as lights being turned off and on, mechanical objects being activated, pictures and other objects being moved, and other similar events. Symbolic ADCs are another common type of ADC in which percipients report receiving some kind of sign that confirmed for them that their deceased loved one survived physical death. Butterflies are the most commonly reported ADC sign.

Also reported are shared ADCs in which two or more people have a similar experience with the deceased at the same time. Such shared ADCs are noted in numerous studies and most recently in the study on emergency service workers. There were reports of partners who were interviewed separately who recounted similar ADC experiences with the same deceased patient at the same time—neither had discussed the experience with the other.

Crisis ADCs in which percipients had a communication with, or visit from, the deceased when they had no knowledge of the deceased person's death and often no knowledge of the deceased person being ill or in danger also are noteworthy. In these reports, the notification of death after the ADC experience led percipients to believe they had really been in contact with the deceased. In many reports, the percipients noted the time and/or told someone about the experience, and often the time of death coincided with the percipient's time of experiencing the ADC.

Lastly, deathbed visions are common among the terminally ill who are close to death and who report communicating with those already deceased. Researchers who studied this phenomenon stringently controlled for other factors that may have contributed to hallucinatory experiences, such as medication and medical diagnosis or condition. Patients having deathbed visions were deemed to be in contact with reality and typically reported feeling comforted by their ADC experiences. Many people report having multiple experiences, experiencing a combination of types, and experiencing ADCs with more than one deceased person.

Conclusion

Most people report ADC experiences as being positive, healing, comforting, and/or life-changing. For some, the ADC experience actually saved their lives. Rarely people have reported unpleasant ADCs. Many experts believe an unpleasant experience is a result of percipients not knowing that ADCs are common and normal and, therefore, having difficulty integrating these experiences. People consistently have expressed relief when they heard ADCs were normal and common. It is likely that even those with unpleasant experiences could benefit from them if supported by people who understood the phenomenon. ADCs are thought to be underreported, particularly to helping professionals such as the clergy, psychotherapists, and medical personnel because of concerns about the potential reactions from these same professionals.

People who are in contact with reality and are well aware of the deceased person's death experience ADCs. They are aware that their experience may sound like a hallucination—this is a good indication that they are not actually having hallucinations associated with a mental disorder. They may need or want to talk about their experience, and when they do so, they need someone who is supportive and nonjudgmental and who can normalize their experience. Also, it is important to help people find their own meaning in their experiences rather than interpreting them for them. Many who have the experience hope to have one again, and often those who are grieving and learn about ADCs hope to have such an experience.

Aging, the Elderly, and Death

With the longevity revolution, for the first time in history, death has become a province of the old. During the 20th century, life expectancy increased by two thirds in the developed world. Increasingly its members die upon the conclusion of full, completed lives; in the United States, nearly 8 in 10 deaths occur among those 65 and older. Although this would seem to be the cause for collective celebration, instead old age has become a social problem. Cultural thanatophobia, excessive fear of death, has become thoroughly interwoven with cultural gerontophobia, fear of growing old or fear of the elderly, the latter demonstrated by the multibillion-dollar cosmetic surgery industry to obscure the aging process.

The cultural consequences of this great demographic change are considerable. Sociologist Wilbert E. Moore observed how the increasing longevity of all classes in postindustrial societies has disrupted the centuries-old synchronization between the temporal order of social systems and the temporal order of biological humans. Our contemporary social problem orientation to old age and anxieties about death may exist, in part, because we now outlive the traditional lifespan "recipes" and no longer "know" how to grow old and die. Whereas the traditional liminal state between life and death occurred soon after death, it now precedes mortality; one can now be simultaneously alive biologically and yet be socially dead.

With the old replacing the young as the most death-prone age group, the elderly have become the cultural shock absorbers of death, society's "death lepers" as Arlie Hochschild called them in *The Unexpected Community*. Death was a province of the young in Puritan New England, where parents often sent their children away to the home of relatives or friends ostensibly as a method of discipline but perhaps in actuality as a way to prevent them from becoming too emotionally attached to their offspring. Analogously, similar distancing from the death-prone is evidenced when the old move to age-segregated communities and when families send their aging family members to nursing homes to be cared for by others. This logic is evident in one of the central social gerontology paradigms of the last third of the 20th century, disengagement theory, which portrays a mutual parting of the ways between society and its older population. From the perspective of those aware of their limited life and with diminished ego strength, social withdrawal accompanies self-preoccupations and weakening emotional investments in others. From the perspective of society, the deaths of the disengaged diminish the disruptiveness of their deaths. It has been argued that the retirement phase of the life cycle arose, in part, as a cultural death consolation.

The longevity revolution has also affected the logistics for security that older persons traditionally had to command the loyalty and services of family members during their enfeebled years: inheritance. With land decreasingly being the chief legacy asset of individuals and with the increasing number of years spent in retirement and the dramatic post-1960s inflation of goods and services, particularly in medical care, the majority of older Americans now outlive their savings.

Further, given the age-stratified nature of so many social roles in modern societies, where individuals are more likely to interact and befriend their age mates throughout the life cycle, the longevity revolution has also made the final life stage a period of continuous bereavement as one's peers

die off and funerals comprise a growing part of individuals' social life.

Cultural Meanings of Death

American society is said to be if not a death-denying culture then at least a death-defying one. Social progress is measured in terms of increases in life expectancy rates. The obsession with quantity of life is reflected in the media attention given to the superannuated. For years, Willard Scott of NBC's *Today* show would give happy birthdays to new centenarians. The world's oldest person receives international recognition and a Guinness World Record certificate. In 2002 the honors went to a 115-year-old Japanese woman who slept through her birthday celebrations. Apparently her circadian clock had wound down as she would sleep for 2 days and then would be awake for the following 2 days. Despite such observances, superlongevity does not seem to be the life goal for most. A 2005 ABC News poll found Americans on average would like to live to be 87 years old; only one quarter said that they'd like to live to 100 or older.

Perhaps the cultural emphasis given to the quantity rather than the quality of life is evidence of the weakening influence of religion and philosophy in mitigating death fears. When the status of the dead was revered the authority of the old often was guaranteed. As confidence in an afterlife wanes, so often does the influence of the aged. Further, with dramatic social change, individuals no longer even live with confidence that the values and principles upon which they had predicated their lives will survive them, let alone that they themselves will be remembered. Such emphasis on longevity coupled with the historically diminishing status of the elderly in a society that worships youth has produced a profound cultural contradiction that portends change.

With death so often connected with the elderly, for those not old the prospects of death have (with the exception of those serving in the military) largely been dropped from conscious consideration when planning for the future. For instance, those enlarging their families rarely consider the possibility of the wife dying in pregnancy. The drawing up of wills is postponed. And whereas up until the 19th century one would have been considered a fool if one had not purchased a gravesite and saved for one's funeral expenses by one's late teens and early 20s, nowadays such actions would be considered morbid and pathological.

How the Old Die

Physical anthropologists tell us that like most other mammals, our distant relatives rarely if ever lived beyond their reproductive years. One evolutionary explanation for old age among *Homo sapiens* holds that females who lived longer, but whose fertility was curtailed in later adult life, were more successful at rearing their last-born children and may have contributed to the reproductive success of their earlier children. But because of their diminished biological reserves, the elderly are more susceptible to environmental maladies and have become society's miner's canaries owing to their greater likelihood of dying during climatic extremes and social disorder.

Over the course of the past century the leading causes of death of older Americans have shifted to chronic, degenerative diseases that prolong the dying process. In 1900, their leading causes of death were influenza and pneumonia (the latter referred to as "the old man's friend"), tuberculosis, and diarrhea and enteritis; in 2002 the causes were heart disease, cancer, and stroke, which together accounted for 61% of all deaths. Increasing rates of Alzheimer's disease (a malady experienced by over one half of those 85 and older and, in 2002, the sixth leading cause of death for persons 65 and older) and other memory- and identity-destroying dementias are fundamentally shifting cultural death fears from premature to postmature death. Fewer than 2 in 10 older individuals are fully functional in their last year of life. To die postmaturely is to perish when one's death is not one's own. In addition, there has occurred a concordant shift from cultural fears of postmortem judgment to fears of the dying process, enhancing the cultural authority of medicine at the cost of religion.

The old often must die a series of symbolic minideaths before actually expiring. The life stage is a time of loss: the loss of one's spouse, friends, jobs, health, standard of living, civic roles, driver's license, and of future time. With many living into their 80s and 90s, it is no longer unusual to even outlive one's children in addition to one's peers. For the institutionalized elderly in hospitals or

long-term care facilities, wherein three quarters of deaths in the United States occur, there are the additional losses of independence and dignity. Studies have shown older persons fearing nursing home residency more than death itself.

Such losses produce the common experiences of loneliness, grief, despair, anxiety, helplessness, and rage. Without much future, old age is a time of reflection and reminiscences. This inwardness, coupled with the social and psychological disengagements often made from life, can supposedly diminish such losses as one's attachments to the things of this world are lessened. But not always. Depression is not uncommon, which in conjunction with social isolation heightens suicidal thoughts and actions.

Throughout much of the world, suicide rates are often the greatest within the oldest populations, particularly among males. Such data may well be understated given variability in how coroners classify their deaths and their failure to account for acts of passive suicide, such as refusal to take life-prolonging medications or food. In the United States, for instance, though individuals 65 and older comprise less than 13% of the population, they account for one in five suicides, with 80% of these committed by elderly males. The suicide rate of white males is particularly pronounced: Of those 85 and older, the rate is 6 times that of the general populace—and over 4½ times that of their black counterparts.

Legacy Work

With increasing survivals to an advanced old age, many reach a developmental stage of gero-transcendence, when individuals shift their focus from a materialistic worldview to one more cosmic and transcendental, increasing both life satisfaction and death acceptance. With mentally and physically healthier older years, coupled with decreasing ages at retirement, older individuals have greater time and resources to devote to their legacy work in order to achieve at least some form of symbolic immortality. Former President Jimmy Carter's work with Habitat for Humanity and for his center to promote human rights and alleviate suffering around the world is one example; the Betty Ford Center for the treatment of alcohol abuse is another.

Older persons are learning how to employ the new information technologies to demonstrate the wisdom that the years can bring. Breaking the cultural silence on matters of death fears and grief was the appearance of geriatric1927 on the popular video-sharing website YouTube in 2006, wherein loquacious British pensioner Peter Oakley (aka geriatric1927) shared his autobiography and end-of-life outlooks. Within a week his was the most subscribed user name on YouTube.

Alcohol Use and Death

Alcohol is a potent substance, capable of quickly transforming a seemingly respectable and rational individual into a babbling fool. This power can have further consequences, both immediately and over the long term. Rapid drinking of distilled liquor can lead to death in less than 1 hour, sometimes in as little as 30 minutes. Alcohol use has been linked to the genesis of fatal illnesses and irreversible deterioration in nearly every major organ system of the human body. Rarely does a chronic heavy drinker live a full life course and, at best, suffers multiple disabilities. The idea that "alcohol kills" has been a theme in American culture since the early 19th century, surrounded by data that directly confirm this assertion as well as evidence that is deliberately interpreted to support it.

As part of nature, alcohol predates humanity. Ethanol is a natural product of decay of organic material, making its presence known in all human societies and making its total obliteration

impossible. Despite many attempts, Prohibition has proven difficult to impose permanently.

Nonetheless, societal alcohol use, relative to risk of premature death, is often seen as *playing with fire*. Diffusion of information about the potential of damage and death associated with drinking rarely has a significant impact on the targeted drinking behavior. When access to alcohol is forbidden, people go to great lengths to ensure a steady source of supply. Thus, the public policy expert is forced to observe that much pleasure and positive reinforcement accompanies alcohol use. Relief from stress is sought daily by many individuals and groups through the relaxing effects of drink. Social and sexually oriented interactions as well as business transactions among relative strangers flow more easily with the lubrication of alcohol.

Further, in terms of custom and tradition, there are at least two types of events, each sometimes involving death, when groups and communities facilitate disinhibition through alcohol consumption. These are (1) celebration of rites of passage when alcohol may be used to escalate meaning and (2) commemoration of historical events or time passages during which alcohol may be used to invest and deepen the meaning of the occasion.

Public policy rarely showcases alcohol's social benefits or its embeddedness in cultural practices. Indeed, nearly all social policy statements about alcohol are heavily loaded with implications of damage, disease, and death. Beyond well-publicized dangers, the use of beverage alcohol (ethanol) by humans is intimately intertwined with several different types of explanations of death and experiences related to deaths. These relationships are of multiple types and go well beyond common knowledge that it is *risky* to consume alcohol. This entry offers a review of alcohol, death, and social policy; alcohol and fatalities; ecological perspectives on alcohol and death; and death rituals linked to alcohol.

Alcohol, Death, and Social Policy

The roles of alcohol in death are reflected in the ambivalent attitudes held by Americans, most Western societies, and many other cultures toward alcohol consumption. In addition to the well-documented experiences in the United States, many other Western countries have experienced periods of national Prohibition of the manufacture and use of alcohol. When and where it has been enacted, nations' rationales for alcohol Prohibition have almost always carried strong themes that alcohol causes premature death among both users and bystanders who may not be users. These bystanders include children, who may be the targets of violence or the victims of neglect; pedestrian and vehicular passengers who are struck by drunken drivers; or members of the public who are simply in the wrong place at the wrong time when alcohol-fueled violence breaks out. Prohibition has always carried a strong death theme that has been difficult for its opponents to challenge.

National prohibition is the distinct exception rather than the rule. To the extent that Prohibition exists, it is targeted at specific segments of the population (youth), periods of time (prohibited sales on Sundays, certain hours of the night, election days), and locations (sales prohibited in some locations relative to distances from schools and houses of worship). While the Prohibition of drinking among youth has a strong theme of injury and death, this is not true for the time and location norms.

The source of societal ambivalence clearly lies in the cycles of change from societal protection to societal liberation vis-à-vis alcohol. Consider the sharply contrasting policy of protecting the public from use of a powerful and death-linked substance through Prohibition and the policy of permitting, facilitating, and encouraging alcohol use in a manner that the substance is de facto available to anyone at any time. One perspective is relatively dormant but definitely alive during periods when the opposite perspective is dominant. The opposing visions view government as key to protecting public safety and health and reducing premature death while also abhorring government infringement on individual responsibility and freedom of choice.

Alcohol and Fatalities

According to data released in 2006 by the National Institute on Drug Abuse, alcohol can be blamed for 100,000 deaths in the United States each year.

- 5% of all deaths from diseases of the circulatory system are attributed to alcohol.
- 15% of all deaths from diseases of the respiratory system are attributed to alcohol.

- 30% of all deaths from accidents caused by fire and flames are attributed to alcohol.
- 30% of all accidental drownings are attributed to alcohol.
- 40% of all deaths due to accidental falls are attributed to alcohol.
- 45% of all deaths in automobile accidents are attributed to alcohol.
- 60% of all homicides are attributed to alcohol.
- 30% of all suicides are attributed to alcohol.

Categories of Alcohol Use With "Causal Connections" to Death

This inventory reinforces the question of why a society permits its citizens access to this toxic substance. The foregoing list sets the stage for considering a number of problems in asserting causal linkages between alcohol and death.

At the top of the list are included deaths from cirrhosis of the liver, long believed to be a strongly correlated physical consequence of excessive drinking, as well as being a fatal disease. In fact, despite widespread public belief, there are numerous cases of cirrhosis in which decedents had consumed minimal alcohol during their lifetimes, and a much more vast number of cases of high levels of alcohol consumption for which there is little evidence of cirrhosis at the time of death. Respiratory illnesses are highly correlated with smoking behaviors, in turn associated with heavy drinking, but the specific etiological factor is difficult to discern. However, it is important to note that pathology is a well-developed science, and autopsy can often pinpoint specific etiology. The critical issue though is that the vast number of drinkers, who use the substance moderately, pass through their lives without a premature death attributable to alcohol.

The next category of deaths focuses on accidents. These evoke visions of the drunken person awakening and unable to escape due to the flames generated by dropping a burning cigarette, or the drunk stumbling off the end of the dock in the late night hours. Unlike the medical specialty of pathology, there is a paucity of readily available tools or techniques to discern whether the drinking was the cause of death or simply an element that was present at some level when death occurred. Recognizing that there are extensive forensic techniques available to conduct social-psychological autopsies, these are expensive and rarely come into play unless there is some exceptional circumstance present, such as someone with a vested involvement in the death event.

The frequency with which alcohol as a causal agent is accepted without calling for a social-psychological autopsy is a demonstration of the extent to which alcohol's potent agency is embedded into Western culture. Looked at another way, isolated death events seem much more readily understood in terms of risky individual behaviors rather than risky environmental circumstances. In the two hypothetical cases described in the previous paragraph, it is obvious that a multitude of environmental conditions could have been the cause of death, such as the flammability of the sleeping quarters or access to exits. Likewise, poor lighting or the absence of a locked gate on a dock could have explained the drowning death. Given the sustained omnipresence within American culture of the Prohibition-based vision of Demon Alcohol, these are not the preferred explanations in the absence of an investigation.

The drunk driver is the most prominent in generating an institutionalized symbol in American culture of death caused directly by alcohol. Substantial societal energies are directed toward detecting persons who are driving with a specific blood alcohol content (typically .08%) that is defined as a physiological condition that impairs the ability to drive.

Ecological Perspectives on Alcohol and Death

One way to look at the alcohol linkage to death on the highways is an *ecological* perspective. Five ingredients are present when a drinking driver casualty occurs: alcohol in bloodstream + driver + automobile + highway + crash event. Testing for alcohol in the bloodstream and/or other evidence of alcohol consumption is at the forefront of the investigation and is usually the only dimension of the investigation. If alcohol is found to be present at the .08 level or higher, it is typically concluded that it was the *cause* of the event. When the driver is under 21 years of age, any evidence of alcohol consumption may be attributed as the cause of the accident and thus as the cause of the death.

The alcohol-as-cause explanation takes precedence over other possible causal explanations that

may not be considered. Clearly there is a ready cultural niche within which to place the individual: drunk-driver-as-killer. However, it is clear that other conditions affecting the driver could have "caused" the accident, such as lack of sleep, physical exhaustion, anger, emotional preoccupations, or the simple inability to drive a car. Likewise, unless blatantly obvious conditions are observed, defects in the physical functioning of the automobile itself are not considered as a possible cause of the accident. Similarly, although sometimes considered as a contributing factor, highway conditions are rarely, if ever, attributed as a primary cause of an accident when alcohol is found to be present.

This stands as an example of social processes directing the definition of cause and blame; in this case alcohol is the cause and the drinking driver is to be blamed. Each of the alternative explanations challenges social interests. Police and other control agents have simple measurement instruments to assess blood alcohol content, even though there is clear evidence that not all drivers are impaired when their blood alcohol is at the .08% level. There are no measurement devices or accepted standards to indicate inadequate sleep or emotional impairment. While urine testing is a possible indicator of drug use that may have occurred as long ago as 30 days, it has not yet been implemented in testing for impaired driving. Measurement of the ability to drive is determined by written and driving tests, which never involve a testing official supervising a candidate's driving at a speed limit of 70 miles per hour on a freeway in the dark.

To demonstrate how alcohol use has grown in dominance as a necessary and sufficient condition for explaining highway fatalities, the eclipse of mandatory vehicle inspection is worth examining. Whereas inspection of vehicles for their safety is mandatory in some jurisdictions, it has been abandoned in many others. In metropolitan Atlanta, Georgia, for example, mandatory safety inspections of vehicles were abandoned many years ago. To obtain a vehicle license, the condition of tires, steering mechanisms, brakes, and other safety devices that are vital parts of automobiles are not subject to any scrutiny. Ironically, other considerations with a sociopolitical tinge have ascended in priority: today in Atlanta, drivers may be fined and their vehicles impounded for lacking evidence that the vehicles meet carbon emission standards.

Finally, police and other public officials stand as both judge and jury when it comes to evaluating the possible role that road conditions may play in traffic deaths where alcohol is readily available as the causal culprit. Few public officials or their subordinates stand ready to impugn themselves as agents of death by maintaining unsafe highways.

Alcohol and Lethal Violence

Alcohol also is thought to be a powerful agent in many cases involving homicide. Within American history, the linkage between lethal violence and alcohol can be traced to the Temperance movement. Focusing upon the incredible monstrous power of its characterization of "King Alcohol," Temperance literature portrayed drinkers transfigured from calm and reasonable individuals into irrational killers. The ultimate tragedy was the drunken father coming home and assaulting his family, leading to the death of a child or a spouse. The peculiar causal influence of drinking and the murderous behavior were sometimes portrayed in an epilogue where the sobered father is shown in deep grief and remorse over his actions.

The alcohol and violence linkage has at least two forms: first, where it completely alters the nature of individuals and leads them to behaviors totally outside their *character,* or second, where drinking fully unleashes partially contained violent tendencies in other individuals with a history of trouble. There is, however, little debate over the alcohol–violence linkage in the criminological literature, although the methodological problems of establishing causal directions are well recognized.

In the current social climate in which there have been backlashes against the level of imprisonment in America, the prerelease treatment of prisoners with drug and alcohol addictions is projected to have a major impact on their recidivism. This supposed liberal policy embeds the assumption that these persons' alcohol and drug use made a direct and powerful contribution to the crimes that led to their imprisonment, possibly ignoring other remedies that might reduce recidivism.

Challenges to the validity of the alcohol and fatal crime link are similar to that of the alcohol and highway fatality linkage. Other factors that could have precipitated the crime tend to be ignored if alcohol (or other drugs) is visibly present. This pattern of

causal thinking is often strongly encouraged by the perpetrators themselves, and it continues to be supported when prisoners are asked to reflect upon the causes of the fatalities in which they were involved. It should be no surprise that prisoners would concur that their substance consumption rather than their lack of self-control resulted in their crimes. A more sophisticated vision of alcohol's role in criminal fatalities comes from the relatively new conception of crime "hot spots," where violent crime rates are exceptionally high and where alcohol and drug outlets are central to the environment.

Finally, an innovative addition to this area of explanation is consideration of the alcohol or drug use of the victim in the setting of criminal violence. A drunken victim can be posed in several ways: the victim's alcohol-fueled disinhibition leading to behavior that precipitates a violent act; the victim being impaired by alcohol and thus unable to properly engage in safety-seeking behavior; or the victim actually entering the situation with the intention of being the "villain" but failing to achieve this goal due to alcohol-related impairment.

Suicide

A final category of fatal outcomes linked to alcohol is suicide. Given the manner in which chronic excessive drinking can create collateral and progressive physiological and psychological damages, the behavior of untreated alcoholism is often conceptualized as *slow suicide* or as death-seeking behavior. Autopsies commonly reveal the presence of excessive alcohol intake accompanying the use of other substances, suggesting that the alcohol use either generated the *nerve* to take the other poisons or that its use blunted the effects of the other substances. Likewise, those attempting suicide by means other than substance ingestion may use alcohol to create the courage the commit the fatal act.

Despite its dramatic role as a seductive killer of innocents, alcohol often leaves behind mystery when it is present at a suicide. Sometimes it appears that the suicide may have been an accident, with the individual seeking relief of some sort (but not death) through the effect of some other drug, with the accompanying dose of alcohol leading to an unexpected and unintended toxicity. Alcohol's presence at a suicide may also involve incomplete notes, or a telephone off the hook, suggesting that the individual did not adequately anticipate the effects of alcohol in whatever combination with other substances, and ended his or her life as the victim of an accident.

Alcohol, Death Dramas, and Death Rituals

Alcohol has roles to play both before and after death. In many cultural settings, there is a social license to drink offered to the mourners of the deceased. While Irish Americans have perfected these rituals in manners recorded in fiction and drama, such practices are also found among many eastern Europeans. Drinking during the wake may be suspended for a brief period for the funeral and burial, but then is resumed with vigor at the post-funeral luncheon or banquet. Across different cultural settings, these drinking events have a fascinating double-pronged rationalization: Alcohol is to assuage the grief of the mourners, but it is also used to celebrate the entry of the deceased into the life beyond, free from the chains and burdens of earthly existence.

The diversity in the presence of alcohol at death ceremonies and its patterns of use have been explored cross-culturally by anthropologists. Archeologists have revealed the presence of alcohol in many burial grounds and tombs, suggesting that survivors desired that their beloved and/or revered departed would have the opportunity to drink in a new existence. In recent years, a similar ritual reportedly was observed by the children of the famous singer and drinker Frank Sinatra, who added cigarettes and Tennessee whiskey to his casket before it was closed.

Finally, we have those isolated but dramatic events where alcohol plays into a "death drama." Relatively little analysis has been provided of the role of alcohol in the military, and even during World War II, when a literal swarm of behavioral scientists studied their peers in uniform, nothing in these writers' extensive documentation of soldiers' behavior was offered about the role of alcohol. Very early accounts indicate that ancient warriors readily consumed alcohol to augment their bravery and that such behavior transformed Alexander the Great into a distinctively alcohol-dependent individual. The Southeast Asian conflict of the 1960s and 1970s was marked by great excesses of alcohol and drug consumption. While the current war in Iraq is

generating large numbers of veterans with severe alcohol problems and other disorders, the presence of alcohol in the death-threatening circumstances of battle and guerilla terror escapes discussion.

Altruistic Suicide

In modern medicine, suicide is largely understood as an outcome of depression, an act resulting from a trajectory of mental illness spiraling downward into that profound hopelessness from which the victim cannot recover: Killing oneself comes to be seen by the victim as the only way to relieve intense psychic pain, or the only way out of an intolerable situation. The final act of suicide can sometimes be delayed or prevented by the use of psychotherapy, drugs, and/or emergency hospitalization; long-term prevention strategies for repeat episodes of suicidality include treatment of the underlying illness and continuing surveillance for warning signals of self-destruction. This understanding of suicide casts it as largely nonvoluntary and self-referential, a human tragedy frequently stigmatized and always to be prevented. In contrast, the focus in this entry is on altruistic suicide, the taking of one's own life for the interests of others. Altruistic suicide may be undertaken for the sake of family members or loved ones, for cherished institutions, for communities, for ideas and principles, for society in general, to serve divinity, or for a number of other reasons.

Altruistic Suicide

Among the classic specimen cases of altruistic suicide is the jet fighter pilot, who, when his plane fails, crashes it with himself still in it into a field, in order to avoid a crowded schoolyard. He does so knowingly and deliberately, and he does it to avoid killing the children, even at the cost of his own life. It is a clear case of altruism, the sacrifice of one's own interests to promote those of others. Of course, such a death is not normally labeled "suicide" but "self-sacrifice," "heroism," or some other adulatory term. Nevertheless, the pilot did kill himself by refusing to eject from his crashing plane.

Is this a case of altruistic suicide? This first question can be interpreted as a conceptual one: Given the highly negative connotations of the term *suicide* in English but the positive appraisal of altruistic acts, is it coherent to speak of "altruistic suicide" at all?

A second question concerning the possibility of altruistic suicide is a psychological one: Is it possible for an individual to both knowingly and deliberately cause her own death in a way that focuses primarily on the interests of others, rather than on her own situation and consequences to herself? Is genuine altruism possible at all, or are all our acts self-interested? Thus it might be said of figures who give the appearance of altruistic suicide that they act primarily for the rewards of (posthumous) reputation or religious afterlife: Lucretia, who preserves her sexual fidelity and thus her husband's honor even at the expense of her life; the many Stoic Roman generals who fell on their swords rather than risk defeat or, like Cato, to preserve their honor as well as their people; the legendary Buddhist figure Sakyamuni, who allowed his body to be eaten by a starving tigress; or elderly persons in some traditional Inuit and African cultures, who cooperated in social practices such as being dropped through a hole in the ice or buried alive in order to protect their communities from the burden of caring for them. Tradition counts Lucretia, Cato, Sakyamuni, and to some degree the elderly who cooperated with senicide practices as people extraordinarily attuned to the interests of others; however, motivation may be difficult to assess in widely divergent or historical cultures.

Familiar contemporary everyday examples of what might be said to be altruistic suicide include the mother who leaps onto the train tracks in order to push her child to safety, the soldier who falls onto the grenade to protect his buddies, and similar cases. These cases raise a third question concerning the possibility of altruistic suicide: Is the urgency of these cases so great as to make the notion of "knowing and voluntary" action irrelevant, and are these simply spontaneous, immediate reactions without clear thought as to the outcome?

Yet there are other cases in which there is evidence of long-term, deliberate, reflective attention to both the action of killing oneself and producing beneficial effects for others, the essential feature of altruism: the self-immolation of Buddhist monks and nuns as protests during the Vietnam War, the Japanese kamikaze fighter pilots during World War II, and the highly premeditated and trained jihad acts of suicide bombers in Sri Lanka, Iraq, Pakistan, and many other areas of conflict (called martyrs rather than suicide bombers by their defenders). Some may be acting primarily for posthumous reputation or afterlife reward, but there is clear evidence in many such cases, recorded for instance in letters or videos made prior to a kamikaze flight or a jihadi suicide attack, both of premeditation and of action for a cause involving the interests of one's community.

Is Altruistic Suicide Possible?

Is altruistic suicide possible? Motivational skeptics would deny that any truly altruistic act is possible and thus that truly altruistic suicide is not possible; those theorists who accept the possibility of altruism may answer yes, though it is then still necessary to consider whether *suicide* as distinct from other human acts can be altruistic. Sociologist Émile Durkheim argued that some types of suicide are founded in sociological structures such as conformance to societal expectations in a society in which individuals are highly integrated; sociobiologists such as E. O. Wilson see biological patterns favoring kin selection, such as the self-sacrifice of a member of a group to save the others, that enhance the success of one's genes despite the cost of one's life, and hence not really altruistic at all. A typology of altruism might include evolutionary or biological altruism, personal or psychological altruism, reciprocal altruism (one's altruistic activity conditioned on the recipient's behaving altruistically in return), spiritual altruism, social altruism (prosocial behavior), economic altruism (economic models for altruistic economic transactions, mostly within the family), medical altruism (the benefits to one's own health or self-esteem of altruistic behavior toward others), and various other mixed forms. A more specific typology of altruism with relevance to suicide could be constructed not only with reference to these categories but with reference to the degree of intermixture of egoist and altruist motivation in the types mentioned above: Purely altruistic suicide requires acting solely in the interests of another, contrary to one's own interests; moderately altruistic suicide involves acting in the perceived interests of both oneself and another; and weakly altruistic suicide largely serves one's own interests but is also intended in some degree to benefit others.

What Proportion of Cases of Suicide Are Altruistic?

Even assuming that partially or wholly altruistic suicide is possible, conceptual problems make it impossible to ask what proportion of suicides are altruistic as a straightforward empirical question. However, it is possible to consider a range of potential cases in which altruistic motivation might appear to be central.

Consider, for instance, the elderly person of moderate means, now detecting the early symptoms of Alzheimer's disease. A decade or more of progressive deterioration will mean substantial care needs: The patient will gradually lose short-term memory, fail to recognize caregivers and family members, and typically sustain financial costs for custodial care estimated in 2008 at perhaps $100,000 a year. Would a suicide intended to preclude these burdens for others count as altruistic? A part of the motivation in such cases may be to avoid the perceived indignities of late-stage Alzheimer's disease—spoon-feeding, diapering, and constant surveillance—but might some or much of it be altruistic, to avoid the burdens of care that fall on family members or, especially where adequate health insurance is not available, expenses that bankrupt the family and mean no financial legacy can be left for descendants? Inasmuch as suicide is not openly socially accepted on grounds such as protecting one's family from financial burdens, it is difficult to know how many such cases now occur or might occur under other cultural attitudes or social expectations.

Should Altruistic Suicide Be Socially Tolerated and/or Legally Permitted?

Consider the issue of altruistic suicide in terminal illness. Most physician-assisted suicide in jurisdictions where it is legal, particularly Oregon and the Netherlands, is associated with cancer, about 80% in each, forgoing a relatively brief period of life, estimated in the Netherlands as on average about 3.3 weeks. Are such "suicides," or occasions of aid-in-dying, egoist in character, sought by the patient to avoid pain or suffering in the final period of dying; or are some or many at least partly chosen to spare family members or one's community or society the emotional, social, and financial burdens of care?

If the latter, should they be socially tolerated? Legally permitted? This is a deeply complex question, answered differently by different societies, likely to vary as a function of the weight given to individual rights, prevention of harms, societal interests and welfare, and religious traditions. Chief among the concerns of those who argue against it is that what begins as a legal option may become an expectation; those who support it may view it as a right, a right that includes the liberty to sacrifice oneself for the benefit of others one cares about.

Should Altruistic Suicide Be Admired?

Permitting altruistic suicide is one thing; socially condoning it and admiring it is another. For example, Szmul Ziegelbojm, a member of the Polish government in exile in London, killed himself in May 1943 to protest the Allies' indifference to the Holocaust. Perhaps, he said in his suicide note, his death would arouse from lethargy those world leaders who would have to act if the handful of Polish Jews still remaining in the Warsaw Ghetto were to be saved from certain destruction. Ziegelbojm has been widely admired for both his courage and his altruism.

In the highly controversial but provocative view of the English poet and cleric John Donne, even Jesus Christ was a suicide. Donne argues that Jesus allowed himself to be crucified when he could have avoided it; he willingly emitted his last breath for the glory of God. However, Donne argues, Jesus was one of the only licit suicides, as suicide is ethically and religiously acceptable only when done for the glory of God. In Christian theology, no occasion of self-sacrifice is more admired than that of Christ; the question Donne raises for later scrutiny is whether it could be counted as (altruistic) suicide.

Social or legal permission for and admiration of altruistic suicide might be said to have coercive potential as well. Famously, Mary Rose Barrington asked, what if it were considered heedless self-arrogance to live on? And John Hardwig, stirring considerable controversy, insisted that one *ought* to end one's life if continuing it in the kinds of illnesses that could mean substantial burdens for one's family or significant others, an argument that would certainly apply to prolonged deaths by

cancer, organ failure, or advanced frailty and dementia, as the vast majority of deaths in the developed world now are. The question here is whether widespread societal admiration of such "suicide," called by some alternative term free of negative connotations, would come to be expected—the normal, essentially required course of action for anyone in such circumstances. This would of course return to the initial conceptual questions about suicide in general: not just what counts as suicide and whether suicide can be altruistic but whether altruistic suicide, which becomes normal and expected, remains altruistic and indeed whether it would have anything ethically in common with what now counts as suicide. Suicide is currently understood in contemporary medicine as largely nonvoluntary and self-referential, the product of depression or mental illness, something frequently stigmatized and always to be prevented. Widespread acceptance or admiration of altruistic suicide in a range of familiar end-of-life contexts would thoroughly challenge these assumptions. The phenomenon of altruistic suicide is already familiar in contexts such as social protest, jihadic suicide, and self-sacrifice in defense and military situations, but the issue of altruistic suicide as the societies of the developed world gray and age is likely to loom much, much larger as among the most challenging of moral issues at hand.

Alzheimer's Disease

Alzheimer's disease (AD) is the leading cause of dementia in seniors. Although the condition also occurs in persons under age 65 (known as early-onset AD), this is extremely rare (approximately 2% of all cases) and involves a drastically accelerated version of the more typical disease course. Individuals with late-onset, or typical, AD can survive for 20 years with the condition, whereas those with early onset live only 3 to 5 years after diagnosis on average. Estimates purport that by 2050 the number of AD cases in developed countries will exceed 36.7 million. Currently, AD is estimated to impact 4 million Americans, or 8% of the U.S. population over age 65, with projections reaching 12 million by 2050.

Historical Background

In 1906, German psychiatrist Alois Alzheimer described the first case of what became known as Alzheimer's disease. Auguste D., a 51-year-old German housewife, presented at an asylum in Frankfurt with jealousy, paranoia, difficulty remembering, and nervous pacing and died after 4 years of progressive decline. Upon autopsy, her brain revealed innumerable concentrations of tiny clusters and dead neurons in the cerebral cortex; these amyloid, or neuritic, plaques and neurofibrillary tangles are now considered hallmarks of the disease. Dr. Alzheimer's second case, Johann F., a 56-year-old man who was forgetful, could not find his way, and was unable to perform

simple tasks was observed from 1907 to 1910. He died within 3 years of presenting symptoms, and countless amyloid plaques were found postmortem. Unlike Auguste D., however, neurofibrillary tangles were not detected.

With the advent of medical dominance in the 20th century, the question of whether or not old age, and thus senility, could be cured became a subject of intense debate. Therefore, Dr. Alzheimer described the cases of Auguste D. and Johann F. amid an existing controversy about the relationship between aging and senility. Because dementia was at the time considered a psychosis rather than an anatomical disorder, these cases were seminal in establishing a biological basis for insanity. In 1910, the eponym *Alzheimer's disease* was first used by Emil Kraepelin, a founder of modern psychiatry, in the eighth edition of his *Handbook of Psychiatry*. This assignment was based on the knowledge of only four documented cases despite the different neuropathology observed and the reticence of Dr. Alzheimer, who felt his cases demonstrated accelerated versions of the condition called "presenile dementia" rather than the discovery of a novel state.

Historians have suggested that Kraepelin may have rushed the definition of AD as a separate disease category unrelated to age to promote his own interests in discovering physical lesions. Accordingly, the ability to distinguish between normal and pathological brains was an important component in the establishment of AD. The term *Alzheimer's disease*, then, originally referred to dementia in patients with presenile onset of symptoms, whereas *senile dementia* was used when symptoms began after 65 years of age and was considered a natural part of aging despite the fact that clinically and pathologically the two conditions were strikingly similar.

Because AD can only be definitively diagnosed upon autopsy, from 1906 until the late 1970s its diagnosis was largely rendered postmortem. During this period, AD remained an extremely rare condition affecting only younger people. As early as 1933, however, the neurofibrillary tangles associated with AD were discovered in the majority of normal senile brains. Allegedly, most seniors experienced a degree of forgetfulness without it necessarily interfering with their daily living.

By the mid-20th century, however, senescence and senility were a unified construct, and an interpretation of senile dementia as pathological quickly overshadowed previous meanings. In 1968, a study reported that the same lesions observed in the brains of Auguste D. and Johann F. also are noted in 62% of autopsies. Throughout the 1970s and early 1980s, most scientists agreed that the distinction based on age of onset alone was arbitrary.

Over the next decade, leading biomedical researchers struggled to dispel the notion that AD was a rare condition. Each year throughout the 1990s, AD was either the fourth or the fifth leading cause of death in the United States. Through the application of the label AD to those over 65 years of age, a previously natural part of aging (senility) was thereby redefined as a national health problem. The scientific basis for unifying the terms *Alzheimer's disease* and *senility*, however, has been met with resistance given the different rates of decline, neuropathologic changes, and actual symptoms, and many argue that motivations to merge these two terms were political. Currently, it is not known whether early-onset and late-onset AD are the same entity, are entirely separate diseases, or exist on a continuum of the aging process, leading some to advocate a "spectrum approach" to dementia.

In concert with the National Institutes of Health, biomedical researchers and families afflicted by dementia banned together in search of accurate diagnoses, treatment options, resources for caregivers, and ultimately a cure. In 1980, the Alzheimer's Disease and Related Disorders Association (ADRDA) was formed. In October 1980, a letter to the newspaper column "Dear Abby" sought advice on caring for a husband with probable AD; the letter writer was referred to the ADRDA, which made the association visible to the public. The following year, Hollywood actress Rita Hayworth was reported to have the disease. Together, these factors brought the scientific studies highlighting the prevalence of AD to the attention of media and lay audiences. Consequently, AD emerged as an illness category and policy issue in the 1980s, more than 70 years after the first case had been documented.

Contemporary Context

Researchers and affected families have been at the forefront of shaping policy and research responses to AD since the 1980s, when the disease model of

dementia gained prominence in Western culture. Awareness of AD in the United States has largely been driven by characterizations of the burdens on families and society. Designations such as the unraveling of self and a slow death of the mind demonize the disease to focus public attention and political support to address the problem. In the United States, advocacy concentrates on increasing funding for biomedical research with the hope of finding effective treatments, and preferably a cure, for this disease. These efforts have predominantly been by proxy, with advocacy coming not from individuals with AD but rather from invested others.

Despite numerous autobiographies depicting the experiences of individuals living with the condition, subjective experiences have historically been marginalized or depicted third-person. Assumptions that it was impossible to ascertain the views of people with AD caused few attempts to be made and inappropriate questions to be asked, rather than exploring what was preserved or what were the (nonbiological) causes of the losses. Contemporary efforts to enhance communication and involvement, however, have demonstrated the enduring ability of forgetful people to meaningfully interact despite the stigma resulting from their inability to navigate the social world in a manner deemed normatively acceptable by others.

The initial exclusion of people with AD from discourse concerning their disease stemmed from the social disenfranchisement of people with forgetfulness that has arisen from at least three sources: (1) *in social arenas,* from the difficulties family members have accepting and understanding the changes in their loved ones; (2) *in political arenas,* by the demonization of the disease as a result of advocacy efforts aimed at increasing awareness of, and research funding for, the condition; and (3) *in scientific arenas,* by its objectification wherein biological and behavioral features of AD are reduced to their component parts in an effort to unlock its complex mysteries. These social forces highlight the role others play in ascribing the status of personhood. Bioethicists have long warned that such marginalization threatens to throw the most deeply forgetful members of society into a social wastebasket.

The loss of self associated with AD has been a dominant trope in America, reflecting a postmodern disorientation and skepticism regarding time-honored conceptions of the coherence and rationality of time, space, and selfhood. Some argue that through deep philosophical roots in modern science, AD and its symptoms came to represent an erasure of selfhood. Since being positioned as a member of a socially undesirable group can cause stigmatization, the resultant focus has become the disease and its manifestations rather than interactional or experiential aspects of *living with* AD.

Noteworthy recent exceptions include narrative accounts of the lived experience of people with AD that question the usage of the word *dementia* and call for a reframing of AD as an obstacle rather than an end; that depict stories of living positively with dementia; and that demand affected individuals be included as full participants in their adventure with AD. These works reconstruct AD by portraying accounts of diagnosed individuals living with what they call a manageable disability. These perspectives strongly challenge the notion that diagnosed individuals become a hollow shell by positioning people with dementia as situated embodied agents; selfhood is not defined by consciousness of thought but rather is a corporeal dimension of human existence. Therefore, dementia is an embodied breakdown, with the most severely impaired living in a world that simply does not appear meaningfully structured. The preservation of human dignity in the face of forgetfulness is critical, because characterizations of AD that serve political or scientific ends cannot sufficiently represent phenomenological aspects of the disease.

Diagnostic advances currently allow for the labeling of AD in the earliest stages and even the potentially preclinical phase called mild cognitive impairment (MCI). The diagnosis of MCI is highly contested due to controversies over the (f)utility of doing so based on a lack of efficacious treatment options and consensus on conversion rates to AD. Studies report conversion rates as small as 9.6% over 22 years and as large as 100% in 4.5 years. Research suggests that MCI cases may be just as likely to convert back to normal as to AD, with as many as 40% reverting to normal. This lack of consensus has led some neurologists and bioethicists to question the legitimacy of the preclinical label itself. Some argue that nosological expansions based on neuroimaging and genetics have made diagnosis even more ambiguous, as the uncertainty remaining, even after postmortem examination, calls its empirical reality into question.

The Future of Memory Loss

One consequence of earlier diagnosis is that we are moving into a period when people with the disease are being incorporated into the advocacy efforts that are part and parcel of AD culture. Although this may not signal the end of advocacy by proxy, it should herald a public face for AD. This may strengthen the potential for reorganizing the social typifications in ways compatible with more compassionate care models. Accentuating the sociomoral necessity to care for people with dementia in ways that recognize and preserve their dignity as human beings could also temper the demonization of the disease.

The contemporary conflation of personhood and sentience is arguably a socially constructed phenomenon within Western thinking, or an artifact of modernity. Related to our societal fears, obsessions, and/or denial of death more broadly, AD—and the social death it represents—is uniquely positioned as the most dreaded of diseases by which those afflicted become a mere fraction of their pre-AD selves. AD conjures repugnant images and engages political-economic debates salient to end-of-life issues, namely the gray zone of persistent vegetative state. Rhetoric of "the never ending funeral" suggests that AD is positioned as the worst of deaths, that is, a *living death*.

The combination of this discourse and the trend toward earlier and earlier diagnoses has potentially devastating ramifications not only personally and within families but also for societies within a world that is rapidly aging. Age remains the only known risk factor for late-onset AD. Allegedly, over half of the population that lives to be 80 will develop AD. In such a context, medical innovations simultaneously expand the medical gaze and hasten the start of the stigmatization associated with processes of social death. Earlier diagnoses extend and arguably intensify the personal and interactional tensions that all too often accompany memory loss. The potential impact of diagnosing someone with an unknown, untreatable condition has yet to be studied; subsequently, social scientists, medical practitioners, and bioethicists alike caution against too readily diagnosing the earliest "stages" of memory loss. The fact that AD can only be "definitely" diagnosed postmortem, if at all, renders this nosological expansion particularly salient in modern Western societies, especially regarding the ontology of human life (and death).

Ambiguous Loss and Unresolved Grief

Rarely in human relationships are people totally absent or present. When loved ones disappear without finality of death, symptoms of unresolved grief appear. The cause, however, emanates from an external context of ambiguity that lies beyond the symptom bearer's control. Since the 1970s, this phenomenon has been called ambiguous loss. Unlike the clearer loss of death, ambiguous loss has no official validation of loss and thus fewer supports and rituals to help people begin grieving and coping. Without evidence of death, the incongruence between absence and presence is so distressing it can traumatize and immobilize individuals and families for years.

Types of Ambiguous Loss

There are many kinds of ambiguous losses, but these tend to fall within two types, one physical and the other psychological. In both types, however, a loved one's absence or presence, or status as dead or alive, remains unclear. Both types can occur at the same time.

Type 1 ambiguous loss occurs when a family member is gone but not gone for certain. Such people are physically absent but kept psychologically present because they could return. Catastrophic examples are people who have disappeared, been kidnapped, or are lost without a trace at sea or in wartime. More common examples of the physically missing are those due to divorce, adoption, incarceration, military deployment, and immigration. This first type of ambiguous loss is also called "leaving without good-bye." People are deprived of physical access to someone they care about, so they suffer a double loss: the loss of that missing person's physical presence plus the loss of volition in being able to say farewell. For example, in the case of people gone missing in wartime, children kidnapped, or infants given up for adoption, the physical transformation that marks death is a privilege denied. Without official verification or a body to bury, such families may never be assured of death, so they must live with the pain of no closure.

Type 2 ambiguous loss occurs when a loved one is physically present but psychologically absent. That is, they are here, but not here. The absence of such a loved one may be due to addiction, obsessions, or extreme preoccupation with work. Catastrophic examples result from dementias, brain injury, autism, and chronic mental illnesses. More common examples result from depression and, pertinent to this discussion, the melancholia of unresolved grief. This type of ambiguous loss is also called a "good-bye without leaving."

Brief History of Research and Theory Development

Grounded in stress theory, which focuses on the management of relationship stressors (in this case, ambiguity), the research on ambiguous loss began in the 1970s with families of soldiers missing in action in Vietnam and Southeast Asia. Since then, research has continued with families where there is dementia, military deployment, autism, traumatic brain injury, and family estrangement due to sexual orientation. Ambiguous loss theory has been applied to guide family and community-based interventions to cope with losses due to Alzheimer's disease, the missing after the terrorist acts of September 11, 2001, the kidnapped in Kosovo, the swept away in South Asia after the tsunami, and the displaced after Hurricane Katrina, among others. Whether loved ones are lost in body or mind, their families are likely to experience frozen grief—a sorrow that never ends because the mystery never ends. The therapeutic goal therefore is not closure but rather an increased tolerance for ambiguity. This is not an easy task in a culture that values mastery and certainty.

Ambiguous Loss as a Cause of Unresolved Grief

The idea of insolvability so inherent in ambiguous loss blocks the resolution of grief for several reasons. First, the ambiguity confuses people. Family members with loved ones lost, but not clearly dead or gone, do not respond completely to traditional grief and trauma therapies. Second, the ambiguity makes people feel helpless. In a culture that values answers, an unresolved loss is viewed with impatience and often blame. This further

isolates sufferers, eroding their resiliency and healing. Third, people with ambiguous losses are denied the symbolic rituals and supports that exist when there is a verified death in the family. They are uncertain about what to do. They understandably resist the grief process and feel guilty if they begin. Having no rituals and traditions to grieve with partial loss, many erase the ambiguity arbitrarily—by acting as if the absent person is clearly dead—or as if nothing has changed and that he or she will return as before. Fourth, the ambiguity freezes relationships in limbo. For example, young children presently at home are ignored as parents are obsessed with finding a missing child or being with a terminally ill spouse at the hospital. Fifth, friends, relatives, coworkers, and professionals often become impatient with people experiencing ambiguous loss and may equate the unresolved grief with personal weakness. Blaming the victim and withdrawing will only lessen the resiliency people need to live with the ambiguity.

Finally, because the ambiguity complicates both loss and its resolution, the idea of closure is counterproductive. In normal grieving, according to Sigmund Freud's perspective of mourning and melancholia, the goal of recovery is to relinquish one's ties to the loved object and eventually invest in a new relationship. This is the difficult work of mourning, but it is a process that is meant to end. From this perspective, emotionally healthy people are expected to resolve a loss and move on to new relationships—and do so relatively quickly. While some therapists now encourage living with grief, even from death, closure is assuredly unrealistic when losses are unclear. Once the goal of closure is let go of, individuals can more easily see complicated grief as a normal reaction to abnormal loss—an uncanny disappearance that continues relentlessly without answers. Unlike with death, ambiguous loss does not allow the detachment that is necessary for closure, or even resolution. Another approach is needed.

Increasing Tolerance for Ambiguity

The stress and anxiety people experience with such irresolvable loss is externalized and named: ambiguous loss. Externalizing and labeling the problem allow people to let go of self-blame and begin the coping and grieving processes. Knowing that even the strongest and healthiest people are overcome by ambiguous loss, people more willingly participate in individual therapy or family groups that help them move forward in their lives despite the ambiguity. Relieved that closure is no longer a goal, they more willingly think about what part of their loved one is irretrievably lost and needs grieving versus what part of that person is still present to be enjoyed and celebrated.

With ambiguous loss, the only opportunity for change and moving forward is to learn to hold two opposing ideas in perspective at the same time: "He is here, but he is also gone. She is present, but she is also absent. He is in all probability dead, but maybe not." "Both/and" thinking serves to strengthen people's resiliency in the face of unanswered questions. Said another way, it is useful for family members to be able to accept the paradox of absence and presence. By embracing the contradiction, people are better able to manage the stress of ambiguity and live well despite the lack of closure. Six guidelines for increasing tolerance for ambiguous loss are summarized here.

Finding Meaning

At some point, the goal is to find some positive meaning in the loss and ambiguity. This is done by reconstructing the narrative of what happened into a new story that hopefully eases self-blame, guilt, and the desire for retribution or violence. Positive meaning is best found through voluntary listening and telling stories of pain—and strength—in the company of others who have experienced similar loss.

Tempering Mastery

Research suggests that the more people are accustomed to mastering problems and controlling their lives, the more depressed they become with ambiguous loss. Highly mastery-oriented people have less tolerance for ambiguity and thus feel more helpless when faced with unresolved problems. Tempering mastery means increasing one's tolerance for ambiguity.

Reconstructing Identity

It is confusing to know who we are in the context of a missing family member. People begin to

question their traditional role set if the only role left is to take care of a mate who no longer knows his or her spouse. Gradually, they must reconstruct who they are in relation to the missing loved one. For example, the wife of an Alzheimer's patient said she no longer saw herself as a wife but as a widow-waiting-to-happen.

Normalizing Ambivalence

The ambivalence experienced with ambiguous loss is "sociological ambivalence," meaning it is caused by an external social force, not psychological weakness. While ambiguity understandably feeds ambivalence, conflicted emotions such as love/hate and anger/joy must be managed. Talking with others professionally or in groups helps to bring negative feelings into one's consciousness. Once acknowledged, discussions about how to prevent harm can follow. Wishing loved ones dead when they are missing or in pain is not unusual or wrong. With ambiguous loss, ambivalence is inevitable, so it is essential to talk about this topic with others.

Revising Attachment

The stress related to not knowing whether a person we love is here or gone illustrates an intersection of cognitive and psychodynamic theories. In an environment of ambiguity, confusing attachments and the lack of meaning are linked to blocked decision making and coping processes. In such contexts of doubt, relationships are conflicted. Revising one's attachment to someone who is ambiguously lost requires a new view of absence and presence and a tolerance for paradox and no closure.

Discovering Hope

The father of a boy lost in the mountains tells reporters that his search will not end until he finds him. Understandably, he hangs on to hope that his son is still alive somewhere and will be found. Later, if the boy is not found alive, the father may discover new hope that the boy's remains will be found so that he can bury them. An alternate method is to symbolically honor the child through creating a form of remembrance within family and community. What one hopes for must change as time passes, but this happens best in narrative with others. When loved ones are kidnapped, swept away, buried alive, or vanish in mind or body, family members continue to hope. Rather than seeking closure, the goal is to imagine and discover new hope.

In conclusion, while the unnatural mystery of ambiguous loss can traumatize, most people eventually move forward with their lives. They accomplish this by holding two opposing ideas in their mind at the same time: the person I love is here, but not here; gone, but not gone. Grasping the contradictions in absence and presence provides the resiliency needed to move forward with life, even after experiencing losses that defy resolution. Remembering that the pathology lies outside the individual helps lower blame and stress.

American Indian Beliefs and Traditions

American Indian beliefs and traditions include reverence and respect for life. Death is not all that different than life, for everything is sacred. Every part of the dirt, rocks, trees, of all things, is sacred.

The ashes of the dead are resting in sacred ground. Rather than disconnecting with the dead, American Indians continue to have a relationship with the dead. Rather than fearing death, it is a part of the life cycle to be accepted. The deceased continues to be loved and continues to love, care for, and protect the living.

All life is important. The plants and animals that gave up life in providing sustenance on a daily basis are thanked, as is the soil that nourishes the plants and the animals. Mother Earth is thanked for providing sustenance to the living. Everyone, including the least among the community, is thanked for contributing to the people's survival. This is the credo of American Indian beliefs and traditions as these pertain to the death and dying human experience. In the following sections historical and contemporary practices are examined.

Historical Development and Decline of Tradition

Native American burial and bereavement practices have been changed and forgotten over many centuries. The infusion of European religions, the lack of a written history of religious and spiritual practices, and the decline and death of many Native American languages means that many practices and ceremonies have been lost forever. Although some tribal groups cease practicing traditional ways, for all cultural groups death remains a village affair. People wash and prepare the body. Family and friends mourn the loss; some wear mourning clothes. All engage in mourning practices as the deceased is assisted on his or her journey by song, laments, eulogies, gossip, laughter, joking, appeals to spirits, appeals to God, dancing, prayer, and ritual. Some cremate, some bury the deceased.

Impact of Christianity

Like many clans, the Flathead Indians combine Christian and quite often Catholic traditions with their own traditional ways. Some Christian clergy act with respect and try to preserve traditional ways. Many funeral directors also respect and preserve traditional ways. Others attempt to destroy the traditional American Indian beliefs and practices.

Also known as the Salish, Bitterroot Salish, and as the Pend d'Oreille or Kalispel, the Flathead and other Plains Indian groups assimilated many Christian practices. The sign of the cross, "In the name of the Father, the Son, and the Holy Spirit," for example, is translated "L'squest's Le-eu u Sku-se u Sant Spah-pah-paht. Ko-mee e-tse-hyl." Flathead funerals include wakes and feast days are celebrated. Believing that death comes to all, young, old, rich, or poor, the Flathead are always ready for the inevitability of death. Each morning, one gives thanks to God for the day, for life, and for assistance in surviving the day. Prior to sleep, one gives thanks to God for the day and to awaken another day. Death is not feared; rather, death is anticipated as a joyous event. For the Flathead the wake represents a spiritually uplifting experience for all. One greets the deceased and prays with the prayer leader and someone stays with the deceased throughout the 1- to 3-day wake.

Prayers are spoken while the grave is opened and closed, during the procession to the church, during the funeral, during the procession to the cemetery, and during memorial and feast days. Many years ago, feasts and memorial giveaways were planned for a year after the death; today, most plans are made for a memorial dinner and giveaways are scheduled for disbursement immediately after the burial. A contemporary issue is that everything is finished quickly, leaving little to enhance thoughts of the future. This provides the family little opportunity to grieve and to express sorrow. Those who receive keepsakes help take away the sorrow of the bereaved. Material things are not important, but the love that the items represent is essential. Deferring the feast day and memorial dinner allows the family to release their sorrow. But abandoning this practice by adopting Christianity and modern practitioners has served to erode traditional beliefs and traditions.

Burial and Bereavement Practices

Burial and bereavement practices vary among American Indian clans. The Ojibway Indians, for example, believe that it is important to feel good about self and to live life in a manner that reflects appreciation for all living things, to avoid harming or destroying life. Ceremonies begin with a tobacco prayer offering. The pipe's smoke carries the prayer to the creator.

The Ojibway bury their dead in their best clothes along with tools, tobacco, and food to take on the journey to the land of the souls. However, many burial mounds have been sold and developed into housing tracts, roads, and other intrusions. Many other burial sites have been looted, excavated by archaeologists, and bulldozed under building construction. To prevent further violations, the Wisconsin Ojibway have purchased many of these mounds.

The Iroquois Indians also bury objects with their dead. They fast for 10 days, and surviving spouses do not remarry for a year. Some groups blacken the face of the mourners and the dead person. After tattooing the body, the corpse is decorated with feathers and wrapped in furs and then buried either on a scaffold or below ground. The Iroquois believe that the soul does not leave until the Tenth Day Feast. At this feast, the possessions are given away and the favorite foods of the deceased are served to guests.

The Assiniboine Indians of the Great Plains place the corpse on scaffolds with the feet pointed to the west. After the scaffolds rot, the bones are collected and, except for the skull, buried. The skulls are used in a sacred village of the dead ceremony during which time friends and relatives speak to the dead and leave gifts.

The Hopi Indians are noted for having simple ceremonies in honor of the dead. Symbolizing a rain cloud, the face is covered with a mask; a woman is buried in her marriage gown, the man dressed in clothing appropriate to his clan status. The Hopi silently lower the body into the ground with prayer sticks, cover the grave, and leave food for the journey to the spirit world.

The Diné, or Navajo, Indians believe disease and death result from evil doing, witchcraft, spells, and dreams. One counters evil through ceremonies of blessing. Death represents the beginning journey to the next life. Grandparents receive respect from the children as they listen intently as elders speak of life and death and grief.

Throughout the life span, the Navajo passively accept death and the other traumas of life. In the wake of the death of a loved one, withdrawal is a common response to grief and loss. Women are more likely to cry openly. Men cry, but not publicly. Both are likely to have engaged in long periods of nonproductivity while experiencing a loss of interest in life and its pleasures. Although mothers and sisters continue to work, it may be months before the grandfather returns to his craft or sheepherding. Children, on the other hand, quickly return to their usual ways.

The Apache Indians employ strong interpersonal communications, humor, music, art, and social support to deal with illness, injury, and grief. The Apache believe that the spirit of the dead does not immediately depart for the underworld, and thus relatives who touch the body are likely to experience ghost sickness and may themselves require healing.

Apache are dressed in their best clothes, wrapped in a blanket, carried to the hills, and placed into a crevice or a shallow grave. Among the Western Apache, ashes and pollen are sprinkled in a circle around the grave, beginning at the southwest corner, to offer the soul a safe journey to heaven; in addition, water is left by the gravesite.

Crying and wailing occur during the Apache wake. Sometimes the body is left in the wickiup, which is pushed down upon the body. The Chiricahua Apache wives and children cut their hair short, cover their faces with mud and ashes, and dance to avoid ghosts from capturing them after the death of a warrior. Yuma Apache, the only Apache group to cremate their dead, also burn all of the deceased's possessions. In recent years, however, funerals and wakes have become a common practice.

The Apache mourn and wail, cut their hair short, and continue to mourn until their hair length is reestablished. Many Apache or Inde have incorporated nontraditional ways such as memorial dinners, Christian hymns and rituals, and the use of funeral directors.

Among Plains Indians, tribal attitudes and beliefs pertaining to dying and death are varied. The Lakota view the soul as having at least four distinct attributes: Ni un, Sicun, wann'gi, and Ton. Like the breath emitted from the body on a winter day, Ni un (life) leaves the body at the moment of death. But it is this aspect of the soul or spirit that is most feared because of the uncertainty of when the body is free of the spirit.

Sicun (spirit helper) is the second aspect. Like the Kachinas of the Hopi, the dead can assist the living. Like the Catholic concept of guardian angel or guardian spirit, the Plains tribes look to the

dead to help the living. As Catholics look to saints and deceased relatives to intercede for them, Plains tribes look to the Sicun.

The third aspect, wann'gi (spirit shadow), helps others; it can also be angry with the living. The shadow world and spirits are discussed by many tribes. Stories and tales of wandering ghosts or displaced spirits indicate these spirit shadows dare not be offended. Much of the secrecy they maintain surrounding burial and grieving practices is based upon this concept.

The final aspect is Ton, or power that makes something. One should listen to and respect the earth. Because they have power and can teach, the living rocks, earth, plants, feathers, and tobacco, for example, are used to make medicine and in rituals to help the living.

Grieving ceremonies are important to the Plains tribes because it is believed that the living and the dead affect each other. Each life has a purpose, a reason for being; each death takes away a critical, functional component. As the fox, coyote, squirrel, or rabbit has a purpose, so do each of us. If the coyote becomes extinct, its message is lost. Among humans, violent death as well as death attributed to suicide and accidents is cause for mourning. We will all be the less for not learning their message. Each death must be mourned, but those who leave the world go on a spirit trail. When death occurs, the deceased sees all of his or her relatives and waits for his or her descendants to join them.

Cremation

Cremation was the dominant form of body disposal for Yuman-speaking tribes—including the Hualapai (Walapai), Yavapai, Havasupai, Mohave, Cocopah, and Maricopa—the Kumeyaay (also called the Diegueño), and others. The Yuma of the Lower Colorado River and the Shoshone tribes of the Great Basin also employed cremation, as did some northwestern Central and South American tribes. But mission life generally destroyed traditional aspects of cultural life for most tribes. Crowded into small towns, these tribes experienced dramatic changes to their culture, eventually incorporating and adopting new crafts and methods of farming, new foods, new forms of housing, and different religions.

Catholic missionaries encouraged tribes to practice earth burial. With great difficulty, the missionaries convinced the Northwest Coast Indians to adopt the white man's cemetery even though they viewed earth burial with horror. Indians who had less contact with the Spanish and their missionaries were able to keep more of their traditions and way of life intact.

The Mohave Indians resisted the Mission movement. When death occurs among the Mohave, the corpse is quickly laid on a funeral pyre that will be prepared prior to death if death is anticipated, after which cremation follows as soon as possible. After the fire is lit, mourners wail, throw goods, and throw even their own clothes onto the fire. After the fire is complete, the mourners push the ashes and remaining debris into the trench or pit and cover it with sand. Generally, all of the dead person's property, clothes, goods, and even food is burned, and all evidence of the individual ever having lived is destroyed.

Ceremonies continue for 4 days to include abstinence from eating meat, fish, or salt and even from drinking water. Purification rituals are part of the activities of the mourners. The Mohave believe that the soul remains 4 days before departing. Those who prepare the body or touch the dead person or give speeches typically are part of these purification activities. This would involve cutting hair, bathing, and participating in smoke ceremonies and secret rituals. Although most of the old ways, foods, housing, dress, plants, and ways of making a living have disappeared, clan and cremation have remained among those who live in the old way. Although their religion is mostly extinct, the Mohave have not assimilated the Christian beliefs and traditions as did most tribes.

Less affected by the Catholic mission system, the Quechan, or Yuma, are also known for using cremation. The Yuma also were less impacted by the mission system. Near neighbors of the Mohave, their cremation practices are similar. The Yuma built funeral pyres that were house-high masses of logs upon which was placed the dead person. Mourners wail, cry, dance, sing, tear their clothes and throw them into the flames, scratch their faces, throw offerings or even money into the fire, request spirits to take this dead person and those who have died before, burn images of the dead person, and burn their personal items. They mourn for 4 days.

The Shoshone habitat varied, ranging from Death Valley to the Yellowstone Park area. The West Coast Shoshonean include Mono, Serrano, Gabrieleno, Luiseno, and Cahuilla. The Southern California Cahuilla also practiced cremation and burning the houses of the dead; they mourned, and they held mourning ceremonies.

Ancient tribes also practiced cremation. The Hopewell of the Middle Woodlands, perhaps more studied than most Woodland cultures, practiced both burial and cremation.

In conclusion, it is clear that tribal groups provided the dead with ceremonies and dignified disposal. There is much evidence that North American tribes employed all known methods of disposal of the dead, including burial (both ground and air), cremation, and mummification. It is also probable that the cause of death, where the death occurred, the age of the deceased, the sex of the deceased, and the social status of the deceased impacted the mortuary and burial practices of the tribe. However, sufficient information about how such factors influenced burial practices is not conclusive. It is likely that climate, availability of materials to dispose of the body, and religious beliefs were major determinants in how bodies of the dead were disposed.

Native Americans provide social support through the tribe or clan of the individual in the dying and burial process. That same social support system sustains the bereaved after the disposal of the dead. The grief process includes the ceremony of the funeral, the cremation, and the bereavement ceremonies. Extreme emotions are usually managed by these ceremonies. The spiritual nature of the living and the dead permeate the entire process.

No analysis of mortuary and burial practices could provide a complete picture of the attitudes and values of a particular people toward dying and death. One would need to observe hundreds of funerals to uncover subtle practices that might distinguish one funeral from another, even in the same culture. Each funeral will differ because of differences in the age, sex, social position, amount of disposable income, or other factors that characterize either the deceased or the survivors who provide the funeral. Other factors would also include the cause of death, the time of year in which the death occurred, or the personality of the person who died. The attitudes of the survivors or the deceased could impact the type of funeral practices that emerge as well.

Ancestor Veneration, Japanese

In attempting to make sense of death and human experience, many societies have drawn on a discourse that emphasizes the sacred nature of family ties. Such a discourse encompasses beliefs, norms, understandings, and practices that foster continuing relationships between the living and the dead, in which the dead retain an active social presence in the lives of the living. These are explored by focusing on *sosen sūhai,* the Japanese form of ancestor veneration, as highly illustrative of the defining nature of discourses of death for the way people make sense of and structure their lives. This entry examines the way Japanese people

relate to their ancestors through beliefs about life and death, family dynamics, political imperatives, and personal expression.

Beliefs About Life and Death

Ancestral ties are deeply embedded in the Japanese psyche to encompass a familial devotion that is spiritual, even mystical in character. Indeed, sosen sūhai represents an indigenous faith that has remained separate from more formal religious traditions, though having absorbed elements of these, particularly Buddhism. As such, the ancestors or *senzo* represent the main source of religious experience for Japanese people, who tend to consider themselves a secular nation. However, belief in an afterlife where one will eventually join the ancestors is widespread.

The mystical nature of family ties has its roots in early indigenous beliefs and customs that predate the influence of Buddhism, from which they have since been distinguished by the name of Shinto. These emphasize the presence and power of the natural world through the concept of kami, or spirits of nature on which the living depend for their existence. The sense of being surrounded and supported by spirits reflects an agrarian lifestyle based on continuity and harmony between the worlds of nature and culture through close-knit, enduring kinship groups whose dead members become kami. As such, they are objects of veneration.

With no distinct line between the living and the dead, or human and divine, the dead remain available to the living for support and protection, while continuing to depend on them for their well-being, requiring earthly nourishment and devotion from surviving kin. Without sufficient care and attention, the dead may use their supernatural powers to cause trouble for the living. Indeed the dead are feared both for their polluting powers through the corpse as well as the potentially dangerous nature of the spirit. The well-being of the living thus depends on administering to their needs through rituals designed to placate, purify, and petition them.

Family Dynamics

The household, or *ie*, has been the main context for such beliefs and the rites that support them since the 16th century, to shape the moral foundation of Japanese society. Reflecting a discourse of continuity, perpetuity, and harmony, the ie came to represent a spiritual community in which both living and dead family members were essential for its existence and responsible for its welfare and continuity. Such values could take precedence over blood ties. Though ideally the perpetual existence of the ie is based on a system of unilateral succession that is patrilineal and primogenitural, in practice it is not synonymous with kinship. Outsiders may be adopted in if they prove more capable of ensuring the ie's continued harmonious existence. These values are reflected in the mutual affection that characterizes Japanese ancestral ties, encompassing gratitude on both sides, the living for the legacy their ancestors have left them, and the dead for the continuing prosperity of their line.

From at least the 8th century, Japanese families have engaged in sosen sūhai in a way that expresses family solidarity and mutual caring and support for both the spirits of the dead and their living relatives. Such mutuality includes the role of the living in ensuring that the spirit of the newly departed, the *shirei*, receives a safe and peaceful passage to the afterlife. Through a series of rituals, lasting 49 days, the shirei is divested of its polluting association with the corpse and attachment to the world of the living and set on the path to becoming an ancestor. This process is also designed to reassure the shirei of the family's continuing devotion and concern for its well-being. Otherwise it may become angry and resentful and cause harm to the living. Thus these rituals encompass a placatory dimension to ensure that potentially unsettled spirits become settled. Indeed, the concern of the living for the fate of the dead may extend to taking in those spirits who have no one to care for them, reflecting the group-oriented nature of Japanese culture in which the greatest fear is of social isolation. Such concern is reflected in *o bon*, the major summer festival, which welcomes the dead back into the community of the living, giving special place to those who have died since the last o bon.

Strictly speaking, therefore, recently deceased family members can be distinguished from the ancestors, though they will eventually gain ancestral status with the passage of time and appropriate rituals. Until then the dead form the focus of very personal relationships for as long as people are alive who remember them as individuals. These

are conducted at the *butsudan*, the domestic Buddha altar, where offerings of food, water, and flowers are regularly placed, incense and candles lit, and prayers said. Conceived as a mini-temple, the butsudan houses the *ihai* or wooden tablet representing the deceased person's spirit and bearing their posthumous Buddha name (*kaimyō*).

Eventually the remembered dead will fade from memory, lose their individuality, and merge with the family ancestral spirit (*tamashī*). In the meantime, through a process of ritual purification culminating in a final memorial service on the 33rd or 55th anniversary of death, they are rendered fully purified and benign. Thus, fully fledged ancestors tend to form a collective to whom ties with the living are no longer personal and vertical but rather collective and horizontal. In reality such a distinction is less clear as personal memories may be passed down the generations and the conceptualization of ancestors is changing to accommodate contemporary urban lifestyles and values.

Political Imperatives

The importance of ancestral ties to a culture based on close-knit, harmonious communities has been subject to political exploitation, early on forming part of the 6th- and 7th-century promotion of Buddhism. Then, more recently, the 17th century stamping out of Christianity by the Tokugawa government required all households to register at Buddhist temples. These then became the locus of ancestral rites with the Buddhist priest as the officiant. Prior to this ancestor veneration was a household-centered affair requiring no relationship with formal religion or the state. For the first time sosen sūhai took the form of a structured ceremony requiring temple and priests for its legitimation.

This political act resulted in a new popular form of Buddhism, which prior to this time was a religion of the upper and educated classes. Buddhism became central to sosen sūhai to which the institution accommodated itself and in so doing ensured its continued existence. This enabled the government to institutionalize devotion and loyalty to the emperor, via such rites, through the extension of people's sense of familial obligation. The ideology of *kokutai* was promoted as a mystical force residing in the Japanese people as a patriarchal nation in which all people are related to one another and to the emperor. The more horizontal dimension of sosen sūhai was thus reinforced.

Then in the Meiji period (1862–1912) such a binding of Buddhism with emperor worship via domestic ancestral rites was rekindled, with the addition of the *kukotu* ideology being disseminated through the education system. Until the end of World War II, children were brought up to believe that they were part of a long unbroken history of close-knit harmonious communities owing loyalty and obedience to their ancestors and ultimately the emperor. However, the Meiji government's attempt to establish Shinto as the national religion eventually failed as a result of the way sosen sūhai had by now, with almost 300 years of being tied to the state, become synonymous with Buddhism. Indeed, this link still remains even though it no longer serves political ends.

Personal Expression

Since World War II, Japan's increasing urbanization has had enormous impact on both the structure and ideology of the ie. Contemporary city-dwelling conjugal families owe no allegiance to their ancestors based on inheritance of property or long-term coresidence. An agrarian lifestyle, kinship ties, and a sense of the presence of the natural world are no longer the norm for many Japanese people. Yet, in spite of the waning household system, interaction between the living and the dead continues, suggesting that it is not dependent on institutional factors. Rather its persistence has to do with the importance of the more personal dimension. For sosen sūhai is not only about kinship solidarity but also about remembering particular individuals, something that is reflected in the increasing personalization of funerals. In the context of the nuclear family the emphasis has shifted from distant ancestors to more immediate kin. Indeed people's conception of ancestors has become more flexible to include family on both sides rather than only the patrilineal line.

Thus, ancestral ties continue to find expression through private rituals in domestic spaces that people continue to construct for them. For many this will still be the traditional butsudan, whereas for others it may be a smaller memorial space where photographs and other personal items are

kept. More compact, contemporary-style butsudan that can be easily accommodated in a small apartment are now available as *temotokayou* (home memorials), reflecting a shift in emphasis from veneration to memorialization. However, the quality of veneration remains in that family ties have come to represent a profound sense of emotional security and belonging for many Japanese people. The sense of gratitude and respect for what the ancestors have left behind has become linked to the sense of owing one's very existence to one's ancestors.

The forms these private rituals may take are highly varied to reflect the nature of the individual to whom they are directed, such as offering their favorite food and flowers and keeping them in touch with those family matters that are likely to be of particular interest to them. The sense of continuity between this world and the next still finds expression in people's concern to provide dead loved ones with those comforts that reflect their particular preferences in life. It finds expression in the continuing belief that the dead depend on the living for their well-being, sosen-sūhai encompassing *sosen-kuyō*, or praying ***for*** as well as ***to*** the ancestors. The sense of responsibility that Japanese people feel for the well-being of their dead informs the funerary and after-rites that assist the spirit's safe and peaceful passage to the afterlife, the emphasis on pollution having shifted to concern for deceased loved ones' individual needs and comfort. Thus for contemporary Japanese people sosen sūhai continues to reflect a social world in which the fate of both the living and the dead are profoundly interdependent.

Ancient Egyptian Beliefs and Traditions

The ancient Egyptians created a complex civilization that continues to be studied over 2,000 years after the death of the last pharaoh. An undercurrent of matters in ancient Egypt was their system of beliefs, at the center of which existed the struggle between order (*ma'at*) and chaos (*isfet*). When ma'at reigned, people were happy and prospered. When ma'at was not maintained, isfet occurred, the harvest was unsuccessful, the land was plunged into war, people suffered. Therefore, actions were taken to ensure the preservation of ma'at.

The ancient Egyptian culture was rich and complex. Numerous rituals were a part of their system of belief and were woven into aspects of life, ranging from the mundane tasks of everyday living to abstract concepts. The religion of ancient Egypt garnered respect and wielded influence years after the system of government practices by Egypt's pharaohs. The culture and religion continues to be studied thousands of years later and, in that way, ancient Egypt lives on.

Egypt's Cultural Complex

The ruler of ancient Egypt, the pharaoh, was viewed as the key component in the continual efforts needed to sustain ma'at. In addition to the ruling pharaoh's secular duties to make Egypt prosperous, the nation's monarch was also charged with keeping the numerous deities of

Egypt's religion satisfied so that they would, in turn, bless the nation with blessings ranging from prosperous harvests to military victories and guard against the forces of isfet.

During life, a pharaoh was viewed as the living embodiment of the falcon-headed god Horus; upon death, the ruler was believed to have joined Osiris, the god of the dead (the father of Horus). In later dynasties, the view of the people regarding the divinity of deceased pharaohs was heavily promoted; for example, monuments dedicated to Amenhotep I (r. ca. 1514–1493 B.C.E.) included prayers to gain the deceased pharaoh's blessings and assistance.

As the link between the gods and humans, certain rituals required and could be performed only by a pharaoh; the priests, who occupied the upper echelon of Egypt's social structure, located in the official temples located throughout the nation assisted the pharaoh's efforts to carry out the rites demanded by Egypt's religion and in the continuous attempts in maintaining ma'at.

The many stories that discuss Egypt's complex religion show the attempts of a civilization to explain natural phenomena (similar stories exist in many ancient as well as "traditional" religions), such as the movement of the sun (the god Ra and/or Re). Other gods and goddesses were dedicated to certain events, such as childbirth (the goddess Heket). Deities were also associated with abstract concepts, such as wisdom (the god Imhotep), or would be held as serving multiple roles. Egypt's gods and goddesses took different types of forms (including taking human forms, animals, and a combination of the two); some deities would be associated with a variety of appearances. The god Thoth could be shown as an ibis, a baboon, or a man with the head of an ibis. In addition to these different forms, Thoth was associated with various roles, such as knowledge, the Moon, and of scribes. Names were also critical to the power of a deity; prayers, rituals, and gifts could be made only to a god or goddess that had its own name. Some Egyptian deities, such as Re/Ra, also had secret names. This mystery was critical inasmuch as it served as a source of power.

Significant deities of Egypt's religious pantheon symbolized natural forces such as the Nile's annual inundation upon which the people were dependent. These included the god Hapy, whose appearance was that of a man wearing a headdress of aquatic plants or the events throughout a human's life span, such as birth, childbearing, and death.

Among the best-known Egyptian myths are those involving Osiris and Isis, who are portrayed, respectively, as a mummified man, at times with green, black, or white skin, wearing a crown, and holding a crook and flail and as a woman with a throne headdress; the traditions and rituals surrounding these two deities are mentioned in the writings of other civilizations, such as the Greek author Plutarch in his work *DeIside et Osiride*. Osiris was a part of the mythology that was revered at the ancient site of Heliopolis located at the southeastern delta section of the Nile and is referred to in the Old Testament (as On). Osiris and Isis were two of nine deities known as the *Ennead* (Greek for "group of nine") or by the Egyptian translation *pesedjet*. Born from the union of the goddess of the sky (Nut) and the god of the earth (Geb) were five children: Isis, Osiris, Seth, Nephthys, and Horus the Elder. As the oldest son, Osiris became the king of the earth and took his sister, Isis, as his queen consort. Seth, unhappily married to his other sister, Nephthys, was jealous of Osiris' kingship and took steps to gain the throne for his own.

As the myth goes, Seth invites his older brother to a feast supposedly to worship the gods. At the start of the feast, the attendees were presented with a macabre prize, a coffin-shaped chest, to whoever would be brave enough to test its size. While others tried, all the other party goers failed as Seth had arranged its construction to fit Osiris and no other. As part of the fun, Osiris entered the chest, Seth and his co-conspirators slammed down the lid and sealed the king inside the now very functional coffin and cast it into the Nile. Osiris' drowning introduced death to the world. Grieving over the loss of her husband, Isis undertook to find the body of Osiris and through her efforts, Isis was able to retrieve the body of her murdered husband and through her magical abilities was able to reanimate a child, Horus the Child (typically referred to simply as Horus). But Seth had heard of Isis' efforts, and while she was out with her son, Seth was able to mutilate the corpse of his elder brother, cutting the body into 14 pieces, which he then scattered throughout Egypt. Seth and his evil cohorts also physically damaged Horus, at one point gouging

out his eyes. His mother, Isis, used her magic to heal his wounds; symbols of Horus (including the "Eye of Horus" also known as *udjat* or *wadjet*) came to be held as protective amulets and aided in efforts of healing.

Dejected, Isis once again took up the quest to find all of Osiris' body parts and through her diligence she was able to find all, save one piece, Osiris' penis, which had been eaten by a fish in the Nile River. Some myths attribute the fertility-infused silt of the Nile that gets washed onto the banks of the river during the season of inundation to the infusion of Osiris' male member with Egypt's life source. Finding all but one part of his body, Osiris was bound together with strips of linen. Thus, he was held to be the first to be mummified. The myth of Osiris reflected the belief that in order to pass through to the afterlife, an intact body was needed; the mummification process described in the myth also provides a model for funerary practices and rituals. Additionally, the myth binds life with death (as well as the continuation of life after death) and fertility in humans as well as harvests.

Horus sought to avenge his father. Eventually he was able to defeat his evil uncle, Seth, and gain the throne; the son of Isis and Osiris was held as the god of the sky, kingship (as previous stated living pharaohs were believed to be the living embodiment of Horus), and authority.

Ma'at was held as the goal of Egyptian culture. The goddess Ma'at, represented as a woman wearing a headdress of a single typically white feather, was the guardian of order, justice, and truth. When depicted in Egyptian art, a feather symbolized the concepts protected by Ma'at.

Anubis was another god of importance in the Egyptian religion. The god of embalming and cemeteries, Anubis was commonly pictured as a man with the head of a jackal. People would offer prayers to him to help the deceased. Priests performing burial rituals and ceremonies would oftentimes don jackal masks in order to portray Anubis.

The goddess Hathor was portrayed as a cow or a woman with the ears of a cow. She was held as the goddess of various things and concepts such as love, sexuality, fertility, motherhood, dancing, music, and alcohol. Hathor was also viewed as the divine mother of the pharaoh and is portrayed in some Egyptian works as the consort of Horus. Monuments in her honor feature prayers to Hathor for fertility and safety in childhood.

Re was the Sun god and held to be a creator. As the sun is a critical component to agriculture, Re was held as being a powerful and important deity within Egyptian religion. Various objects, such as portrayals of sun disks and obelisks, came to symbolize Re. At times he was pictured as having a man's body and the head of either a ram or a hawk wearing a headdress featuring a sun disc. During the day, Re was believed to travel by boat across the sky, while at night he was thought to pass through the Underworld. Another version of the passage of Re stated that each night he was swallowed by the sky goddess Nut and passed through her body to be reborn in the morning. At various times throughout Egyptian history, Re was melded with other deities, such as Horus (becoming Re-Horakhty, "Horus of the Two Horizons") as well as Amun, who was at times the head god of the official state religion (to become Amun-Re).

During one portion of the Eighteenth Dynasty (ca. 1539–1292 B.C.E.) of ancient Egypt, a new belief system was introduced as the state religion. Introduced by Akhenaten (r. 1353–1336) the sole deity of this new religion was the Aten, the manifestation of the sun itself. While the Aten was not a new concept, it had not previously been promoted as the only god. The Aten was depicted as the sun disc and typically featured rays that ended in hands. The Aten was thought to give, through the rays of the sun, life to members of the royal family, and only they could directly worship the sun. Others practiced the religion of the Aten by worshipping at shrines featuring the royal family in the presence of the Aten (as a sun disc).

The concept of monotheism was in extreme contrast to the traditional Egyptian religion and did not connect with the past. The priests who traditionally held great power and influence within the nation were threatened and neither they nor the Egyptian public were fans of the religion of the Aten. Shortly after his death, Akhenaten was declared a heretic and the traditional polytheistic Egyptian religion was restored.

Art

Art in ancient Egypt served not only aesthetic purposes but also was held as satisfying other aspects

of life. Pharaohs used idealized portrayals of themselves to propagate the concept of the king being a perfect quasi-deity. Representations of gods and goddesses were believed to actually become that deity. Images, such as art and writing, were critical components in carrying out certain rituals and activities; words, written and spoken, were held to have transformative power. Moreover, objects that could be considered pieces of art, like protective amulets (like the "Eye of Horus" described earlier), were common features in an Egyptian's everyday life. Due to space limitations, only art serving a ritual or religious purpose is discussed here.

Duality was a common theme throughout Egyptian culture: life and death, drought and inundation, arid desert and lush oasis. A central belief within the Egyptian religion was the struggle between order (*ma'at*) and chaos (*isfet*). The primary goal of religious rituals was the maintenance of ma'at. Additionally, in the Egyptian mythology, the world at its creation was perfect and no alteration was needed. As such, Egyptians strove for preservation, not change; rituals helped tradition endure and allowed people to feel a connection to the past.

The pharaoh was at the center of executing the rituals and actions required by Egyptian religion. In addition to the spiritual duties, the pharaoh was also the head of the nation's secular realm. To help the ruler, priests helped to carry out the multitude of religious rituals, rites, and tasks and would act as the pharaoh's agents. The priests occupied a place in the upper ranks of Egypt's society and could wield extreme influence.

As with the case of Akhenaten and his attempts to reinvent the country's religious beliefs, the priests of the traditional belief system used their power to squash the monotheist theology of the Aten and in doing so tried to wipe out the monarch, declared as a heretic after his death, from the annals of history. In this effort, depictions of Akhenaten and other nonconformists such as his wife and fellow worshipper of the Aten, Nefertiti, were defaced. This destruction of a person's image (or visual representation of one's name) served two purposes. First, Egyptian culture held that if one was remembered and one's name was spoken by later generations, one's spirit would survive. Second, it was also believed that a representation could serve as a repository for the being that it depicted. So, by smashing Akhenaten's statues and chiseling out his name from stone carvings, it was thought that the people were annihilating the storehouse for his soul and pulverizing his spirit. Hence, his ability to survive after death was extinguished. It was ultimate form of death.

In the end, however, Akhenaten's opponents were not able to completely destroy all of the pharaoh's visual equals. The king who went against the traditions of Egyptian religion, the professor of the Aten, has been passed down throughout time and is argued by some to be the first monotheist, presenting the precursor to Judeo-Christian theology, and the original revolutionary. Due to the uniqueness of the culture promoted during his reign, Akhenaten is frequently examined within studies concerning ancient Egypt. Ironically, if one applies the belief system of Egypt, the spirit of the pharaoh, declared a heretic and actively pursued in order to eradicate, certainly survives to this day.

One of the most important rituals within the Egyptian religion was the "presentation of Ma'at." This ritual, which is pictured in paintings from various periods of ancient Egypt's history, shows a person, most commonly the pharaoh, offering to the goddess Ma'at a feather.

At the many temples throughout Egypt, offerings were made to the patron god or goddess by presenting goods such as food to the deity's statue, which was believed to embody the sculpture. These rituals were performed three times, at dawn, noon, and sunset, in order to sustain the deity. A common theme in Egyptian artwork is displays of these offerings.

The most famous rituals were those focusing on death and the afterlife. An essential requirement for a person to continue existing after death was the spirit to have a location in which to rest; the ideal place would be the body, but in order to choose the correct location, the spirit would need to be able to recognize its own body. In order to maximize the maintenance of the physical appearance, extreme steps were taken to delay decay.

After death, the body went through a process of mummification, which involved various steps, such as encasing the body in natron. Throughout the mummification process, religious rituals were incorporated. One of the more crucial rituals included a ceremony in order to "open the mouth" so that the dead could speak and partake of food

and drink during the afterlife. Written spells would be included in coffin texts and the Book of the Dead to help the spirit circumnavigate the obstacles in the afterlife. Other objects of daily life, such as clothing, cosmetics, cooking tools, statues depicting servants, and so on, were frequently included within the burial site to aid the deceased.

The complexity of the beliefs and rituals within the culture of ancient Egypt pervaded each stage and every aspect of life, from the moment one was created, and continued after one's death. These traditions and rituals helped create continuity throughout a span of several millennia. Even though the government of the pharaohs has long since faded, the rich culture of ancient Egypt continues to live on.

Angel Makers

Angel makers are women who agree to care for foster children for a fee but neglect them until the child dies. But historically two types of angel makers can be identified. The first type of angel makers were 19th-century wet nurses who, because of their poor health and lack of child-care education, often neglected the young children placed in their care by local foundling agencies. The second type were the female angel makers of Nagyrev, Hungary, who were responsible for the death of their husbands, other relatives, and children during and after World War I. Both types put the lives of innocents at risk, and these events serve as the basis for this discussion.

Angel Makers of Officially Sanctioned Foundling Homes

Until the 19th century, children were not accorded much social or family status simply because the concept of childhood was not valued as significant. It is in this context that the first type of angel maker is best understood. This angel maker refers to alleged killers of infants. More specifically, angel makers were either women who, for a stipend, took foster children into their homes, or they were indigent women who, having lost their own infants, stayed at foundling homes, which were intended to solve the infant abandonment problem that existed throughout Europe for hundreds of years. In France, the people hired to transport babies from their home village to a distant foundling home became known as *faiseuses d'anges* or *angel makers*. This name, angel maker, was to become a more common label because of the high mortality rate during this transition to the foundling institution. The label *angel maker* also was assigned to many rural, poorly educated wet nurses, under whose charge a high rate of infant mortality was thought to occur.

Whether intentional or owing to a lack of resources, most of the children placed into foundling homes or assigned directly to wet nurses died because of either being undernourished or neglected to the extent that death occurred. Despite this high mortality, such foundling homes represented a social experiment to thwart the total abandonment of infants and laid the foundations for the modern concept of infant and child foster home care. Before the early 19th century, abandonment of children was common practice, whether by unwed mothers or by two-parent families. However, for infants abandoned during the 1830s to 1870s and prior to

the establishment of standardized child-care policies, placement into a foundling home represented a chance for survival. The placement also provided an economic opportunity for poor women who, for a fee, took abandoned infants into their homes for a short period of time. Along with wet nurses who resided in the foundling homes, these women became known as angel makers.

The motives of the individuals involved to address the infant abandonment problem were noble; they were attempting to save the lives of babies. Indeed, an officially sanctioned system for the abandonment of babies was under development in many Catholic countries, including Austria, Belgium, France, Ireland, Italy, Poland, and Portugal. These series of foundling homes were intended to support anonymous infants who had been abandoned by unwed mothers or the children of indigent families, thereby protecting the good name and social standing of the birth parents. Although abandonment had occurred for many centuries, the foundling home for abandoned infants represented a civilized response to a social problem as well as presenting a more acceptable alternative to abortion and infanticide.

An issue among contemporary analysts was whether the infant mortality rate was higher in the foundling homes or while the infants were under the care of wet nurses. In some foundling homes the death rate was more than 99%. Such statistics and the rampant rumors that surrounded the angel-makers concept led to a movement to close the foundling homes and to end policies that promoted anonymous infant abandonment—a public policy previously thought to be critical to the survival of the babies.

Angel Makers of Nagyrev

A second type of angel maker evolved during World War I (WWI), when captured Allied troops were interned in the Hungarian village of Nagyrev. In this particular village, the male prisoners (with their good looks and relative availableness) were to serve the sexual appetites of the local village women. Deprived of young village men, many of the local women entertained the prisoners in lieu of their boyfriends and husbands who were fighting on the front lines. Some of these women took many lovers and became accustomed to having several male lovers available to them at one time. Following the return of their men in the aftermath of WWI, the relationships between couples were not to be the same as before the war, and the women openly expressed their disdain for their husbands and their less-than-desirable lives with one partner. Because of the circumstances surrounding the perpetrators, the victims, and Julia Fazekas, the women's matronly collaborator, the events at Nagyrev had characteristics common to serial killing.

Although serial killers generally operate alone, among those who conspire to commit murder there are a variety of pairings involving multiple-killers. One of the most common involves females, a situation that characterizes the angel makers of Nagyrev. This group of approximately 50 malcontented housewives who, in consort with a midwife, conspired to murder their WWI veteran husbands became known as the angel makers of Nagyrev.

These village angel makers gained considerable notoriety for their murderous activities conducted during WWI and ending in 1929. During this period, the women were allegedly responsible for as many as three hundred deaths. In collaboration with the widowed midwife, these wives were able to secure sufficient amounts of arsenic from fly paper to poison their unsuspecting husbands, who they perceived to be less than desirable, sick, deformed, and domineering. Later the victims were relatives, including parents and even children who were cause for the women's anger. But the primary targets of these bored, post-WWI housewives were the veteran husbands who, because of their physical disabilities or ill temperaments, no longer served as the focal point of their wives' attention.

Angels

Angels feature in people's lives, deaths, and afterlives in the form of guardian angels, angels that meet people after death or dead people who become angels. After a period in which secularization led to an eclipse of angels, recent years have seen a resurgence of interest in angels in relation to death, for instance in popular religiosity.

By and large angels are seen as intermediate beings between the human and the superhuman worlds. Literally the word means "messenger" or "envoy" (Greek ἄγγελος: messenger; Latin *angelus*; Hebrew *mal'ach* מלאך). In a religious sense it often refers to a messenger of God or the divine. In the Abrahamic religions, for instance, angels are depicted as beings intervening between God and humankind. It always concerns mediation between the immanent and the transcendent, the here and now and a dimension beyond. Thus angels embody a key characteristic of religion: mediation between two worlds via a symbol that makes it possible to experience another world. Often this other world is the domain where the dead sojourn after they have passed on, the hereafter.

There are three main interpretations of the position of angels: (1) They are messengers who accomplish God's will. (2) They are protectors and guides to human beings in their relationship with God and the divine, who also make human contact with God possible. (3) The third meaning is a kind of antipode: the fallen angels who turned away from God and led people into temptation. In relation to death, the first meaning indicates that angels execute an instruction from God or the divine when a person dies. It pertains to how they die and live on after death. The second meaning affects the way people live, die, and live on. Angels take part in human life and help people by preparing them for death and the afterlife. After death they guide people to the hereafter. The third meaning entails the danger that in life, death, and the afterlife, people will not have contact with goodness but with evil—with the fallen angel.

Role of Angels

Angels are seen as God's helpers. In Judaism angels assist God in the Final Judgment as accusers, punishers, and angels of death. In Christianity, too, angels carry out God's will when a person dies, as described in John's Apocalypse. In Islam everyone has two angels sitting on his or her shoulder: one who records the good deeds that the person has done, the other the bad deeds. Hence the daily *salat* prayer ends with the Muslim looking to the right and to the left. When a Muslim dies these two angels appear and announce the good and bad deeds of the deceased. On the basis of their report, God passes judgment. If evil deeds predominate, the person goes to hell; if good deeds predominate, the person goes to paradise. There are also angels who guard paradise and keep a keen watch over who enters it.

Angels are helpers of human beings. In the Abrahamic religions angels play the role of protectors of human beings. They take part in their lives, deaths, and afterlives. Guardian angels—individual angels that guide and protect individual persons—date back to Judaism. Angels directly influence life and death and establish a link with God. In the hereafter they remain at people's side and guide them to paradise. The eternal afterlife with God of people who lived righteous lives is one of fellowship with angels. The righteous are waited on by angels and enjoy their company. Ultimately they may even become angels themselves. That means that they rise in the heavenly hierarchy and are closer to God. This image of angels as guides to human beings is perpetuated in Christianity and Islam, so that they form a link between humans and the divine.

In Judeo-Christian tradition there is also the image of fallen angels. Lucifer, one name for the devil, originally connoted such a fallen angel. These are beings who no longer belong to God but to evil. Since the fall of the angels, described in Genesis 6:1–4, humans have feared the evil influence of these angels. They tempt people to live unrighteously and after death to end up in the underworld rather than with God.

Attributions of Angels

The various meanings attached to angels play a major role in people's images of them, especially in the arts. Christian portrayals of angels are to be found in Roman catacombs, the earliest burial places, from the 3rd century onward. In their earliest form angels represent God, who is close to the deceased. Naturally the way angels are depicted depends on the cultural context. In Byzantine Christianity they are always winged, wings representing their association with heaven. Later the *putto* became a popular type of angel: a winged child representing innocence and purity. This latter type was particularly important at the death of children: an innocent child who becomes an angel after death and lives on as an angel. In Roman Catholic tradition the so-called Mass of the Angels is celebrated when a child dies.

Images and portrayals of angels influence the way people cope with death psychologically. The experience of transcending their bodies that dying people have in near-death experiences is often depicted as an encounter with angels. Bidding farewell while not yet fully departed from life can lead to an experience of contact with angels. According to recent research such experiences constitute an intermediate space between life, death, and afterlife, which is pertinent to both deathbed counseling and bereavement psychology. Bereaved people can establish contact with their departed loved ones in the form of angels, who represent everything the deceased had meant to their relatives.

Animism

Animism has been used in two distinct theories, both of which involve particular understandings of death. The term derives from Latin *anima,* usually translated "soul" (although this term too bears a wide range of meanings in different cultures and religions). Until recently, animism has meant a belief in the existence of a component that distinguishes living beings from inanimate matter. Most theorists have postulated metaphysical rather than physical factors, but in 1708 Georg Stahl (a German physician and chemist) theorized that a physical element, *anima,* vitalizes living bodies just as another element, *phlogiston,* enables some materials to burn or rust. His theory was soon rejected, but exemplifies a widespread interest in these issues.

In 1871 Edward Tylor (often considered the founder of anthropology) adopted Stahl's term *animism* to label what he saw as the central concerns and character of religion. For Tylor, animism identifies a "primitive" but ubiquitous religious mistake, namely, "the belief in souls or spirits." He argued that *all* religions expressed the beliefs that living beings were animated by souls and that nonphysical beings, spirits of various kinds, could be communicated with. Religious believers imagine the existence of something that will survive the experience of death and, therefore, makes its possessors more than mere matter. Many think that humans alone possess souls but some attribute souls to other beings too. Tylor's "souls and spirits" thus include an expansive grouping of "entities that are beyond empirical study" (e.g., deities, angels, ancestors, ghosts). In other words, Tylor argued that such beliefs are wrong because such components of living beings and such metaphysical entities do not exist. However, he did not think these beliefs were irrational, only that people drew the wrong conclusions from their experiences of dreaming about meeting deceased relatives and from feverish encounters with strange beings. According to Tylor, religion was dying out because

proper scientific knowledge was ousting these mistaken beliefs and providing better understandings of the world. In this first version of animism, the question asked is "How are living beings different from inanimate matter?"

Because this approach focuses on what makes living beings distinctive, it involves the idea that death is a contradiction. Either beings must somehow survive death or they must cease to be anything but inert matter at death. Recent developments in the related theory of panpsychism further problematize this by questioning whether matter is in fact inert and unconscious. If matter is inherently conscious, it becomes more difficult to divide mind from matter, and perception from physicality, for example.

Since the 1990s scholars have revisited the concept of animism and offered a different interpretation. In this, the key question animists ask is "How should we live with other beings?" That is, animists are people who understand the world to be a community of persons, most of whom are not human, but all of whom deserve respect. This new theory of animism is particularly helpful in understanding the worldviews and cultural practices of indigenous people, but it also casts light on important trends in Western culture. Although this theory is not so focused on the difference between life and death, animate beings and inanimate objects, it does raise important questions about the experience of death. If this animism is particularly interested in how people should relate to others, it is necessary to ask what happens to relationships when someone dies. Also, animists who seek to respect all beings might be expected to have a major problem with killing and eating those that they claim are also persons.

Many of those who write about the new animism draw on the works of the early to mid-20th-century American anthropologist Irving Hallowell and what he learned from the Ojibwa of southern central Canada. In the Ojibwa language a grammatical distinction is made between animate persons and inanimate objects. While this is true too of the English language in which, for example, objects are usually called "it" whereas people are either "he" or "she," the Ojibwa language has a more inclusive category of persons. For example, the word for rocks, *asiniig*, carries a plural suffix, *-iig*, that indicates that rocks are in the animate category. Hallowell tried to ascertain whether this grammatical distinction made any difference to the way in which Ojibwa people actually treat stones. After all, the French language marks all tables as grammatically female, but this does not generate any gendered treatment. Hallowell asked an old man, "Are *all* the rocks that we see around us alive?" He notes that after long reflection, the old man answered, "No, but *some* are." Then Hallowell writes about the things he has been told about rocks that explain the answer. Clearly, Hallowell has asked the wrong question. The old man was not interested in a theory about whether rocks might be alive or dead, but in knowing how to relate appropriately with rocks and other beings with whom he lived. Thus, *some* rocks in the area were participants in relationship with some humans. They were perceived to have acted in ways that showed them to be persons. Also, humans had acted toward some rocks in ways that demonstrated relationship. Some of these rocks are recognized by the Ojibwa as "grandfathers," respected elders who might aid younger, less experienced or less knowledgeable persons. They are said to willingly join in sweat lodges, ceremonies in which prayers are offered for the well-being of others. Rocks are not merely aspects of the technology of the lodge, heated up in a fire and then sprinkled with water to produce steam and hence sweat; they too offer prayers and, in some cases, sacrifice their lives for others. In this and other ways, Ojibwa look for indicators of relationship rather than signs of life, whatever that would involve. The old and new approaches to animism are about quite different understandings of the world.

The new animism has been discussed in relation to people from most continents and varies enormously in the range of ways in which people claim to find relationality among particular other-than-human beings. But words for "respect" are commonplace in conversations about animism. All persons (human or otherwise) are expected to seek the well-being of other beings among whom they live. Far from projecting human likeness onto other beings as is sometimes alleged, animists understand that humans are just one kind of person in a wide community dwelling in particular places.

The problem of death is a more personal one than in the old animism: How do people deal with

the death of a relation (human or otherwise)? Many animists believe that death is a process of transformation and that people take on a new form, as ancestors or as other animals perhaps, after death. But animists are also confronted with death when they seek to eat. If all beings are theoretically alive and many are actually related, whatever species they belong to, how is it possible to eat with respect? Many cultures involve ceremonies in which the necessary violence of taking the life of a plant or animal person is recognized and some form of request and/or apology is made. Many transpolar and Siberian communities traditionally employed experts (called *angakkut* in Greenland and *shaman* in parts of Siberia and now more widely) whose job description could include apologizing for any offense caused to the other-than-human persons taken as food. Their mediation could be initiated in intense experiences in which they seemed to experience death and dismemberment by beings with whom they formed life-long relationships, reinforced each time it was necessary to sort out problems in human dealings with other beings. In some communities the shaman's job also included conversations with ancestors, but elsewhere this was a role restricted to elders rather than shamans. Ancestors are not conceived of as "dead people" but as significant people who have been through the process of death and now, although transformed, continue to offer support to their families and communities. Ancestors might manifest themselves in some animist communities by possessing people through whom they can speak and act, or by inhabiting significant cultural objects, carved stools, for example, to which offerings and speeches can be made.

Animism among indigenous peoples and in some new environmentalist religious movements (Eco-Paganism, for example) is a significant way of understanding the nature of the world. It involves not only an alternative epistemology (belief system) but also, more importantly, an alternative ontology (way of being in the world) to that of consumerist Western modernity. Experiences of death illustrate key elements of this ontology by revealing the centrality of relationality as a core component of human and other-than-human personal identity.

Anniversary Reaction Phenomenon

The evolution of the notion of an anniversary phenomenon related to both bereavement and death is interesting from both a definitional as well as a historical perspective. One of the earliest mentions of the anniversary reaction phenomenon can be traced to the late 1950s at which time the concept was defined as the tendency to relive a childhood trauma at a specific time. Usually this is the date of a parent's death. This description emerged out of a study of hospitalized patients who had suffered parental losses. In later studies, however, the same phenomenon was found in a sample of nonhospitalized population.

In 1972, the term *anniversary reaction* was used to describe the emotional response of widows and widowers on the anniversary of a spouse's death. Based on research on the bereavement of 92 widowed persons, 30% had only a minimal reaction to the first anniversary of the spouse's death, 67% described a mild or severe reaction; for 3% of the cases, the response was unknown. Because the mild or severe reaction was significantly associated with the presence of clinical depression, it was proposed that the anniversary reaction phenomenon would be useful to primary care physicians as a simple diagnostic tool to evaluate the patient's distress without resorting to a lengthy psychiatric intake evaluation.

A decade later, the notion of an anniversary reaction phenomenon was established firmly in the bereavement literature and now included any

bereaved person and any anniversary related to the death that "reawakened bereavement or morbidity" in the bereaved. Two decades after the introduction of the concept, anniversary reactions were considered a normal if not essential component of the mourning process.

Also in 1972, this same concept, anniversary reaction, was used to refer to the tendency of some individuals to die on a particular date, such as a birth date or death date that had particular significance. The data used to substantiate this esoteric view have been questioned. In standard death education textbooks, an anniversary reaction refers to an increase in intensity of pain on any date associated with the deceased person.

As interesting as the definitional evolution of this concept may be, the historical context within which this concept evolved is perhaps even more interesting. To understand this context, it is necessary to return to the definition of grief as defined originally by Sigmund Freud. In his work, "Mourning and Melancholia," Freud characterized grief as painful but normal. The return to the emotional state preceding the death, however, requires work on the part of the bereaved and compels the bereaved, that is, the ego, to relinquish all energy directed toward the deceased. This argument suggests a linear process in which the intensity of the pain gradually decreases over time and eventually ceases altogether.

The notion that grief is a natural human response to a bereavement or loss and that some effort on the part of the bereaved person is required is generally accepted in the bereavement literature. The delineation between normal grief and abnormal or pathological grief, however, is probably one of the least resolved issues. Two critical issues refer to the degree of intensity and the longevity of the phenomenon.

The intensity of the emotion may render it inappropriate or abnormal. Distorted grief, for example, refers to a grief characterized by extreme anger and guilt. The timing of the emotion may render it inappropriate. This includes chronic grief, an emotional reaction that is excessive and never comes to a conclusion. On the other hand, delayed grief refers to those who may experience what is thought to be an insufficient amount of grief at the time of the loss.

Although the focus on time, intensity, and pathology continued to be of interest to early thanatologists, mitigating circumstances were gradually added to justify a grief that did not conform to the linear process proposed by Freud. For example, an anticipatory grief may precede the death when the dying process is prolonged. Delayed, continued, and/or pronounced pain may be related to the relationship of the bereaved to the deceased or sudden death as opposed to anticipated death. The anniversary reaction phenomenon, then, is one more example of the effort to normalize an apparent abnormal grief, such as the sudden reappearance of intense pain.

Through the years a number of psychological, social, and cultural factors were added to the list of factors assumed to impact the grieving process. These include circumstances surrounding the loss and suddenness of loss as well as the meaning of the loss to the survivor, prior losses, coping skills, and available resources and support. The term *complicated grief* was an attempt to eliminate the need for pejorative words such as *pathological* or *abnormal* for any grief that does not follow the linear process originally delineated by Freud. The continued use of terms such as *distorted*, *chronic*, and *delayed grief*, however, demonstrate that intensity and time continue to be major factors in delineating uncomplicated from complicated grief.

Anorexia and Bulimia

An eating disorder can be defined as a severe disturbance in eating behavior characterized by a

lack of appetite (anorexia) and restrictive eating, or an insatiable appetite and overeating (bulimia), or some combination of these behaviors. Eating disorders are one of the contradictions of a society in which eating depends heavily on a fast food industry offering "supersized" meals as good economics and good nutrition. Eating satisfies a basic human need, but it is also subject to individual, social, and cultural influences. In a society such as that of the United States, the "supersized" culture of food intersects with and contradicts the culture of the beautiful svelte body, especially for females. How one eats, what one eats, and the frequency and quantity of food are controlled not only by individual appetite and food availability but also by factors such as family, peer, and cultural norms about food and body size. Restrictive eating behaviors and overeating are widely supported, and both can result in eating disorders that lead to health problems and, in extreme cases, premature death.

Eating disorders involve behavior that negatively affects physical and mental health; examples include excessive dieting, binge eating, and anxiety due to a negative perception of body image. The correlates of eating disorders include gender, race or ethnicity, childhood eating and gastrointestinal problems, elevated shape and weight, negative self-evaluation, sexual abuse, and a variety of individual psychologically based problems. Despite the risks, however, the practice of restricting food intake to control weight and/or body shape is followed by a substantial number of young women. The two most commonly known eating disorders are anorexia nervosa and bulimia nervosa.

The American Psychiatric Association recognizes anorexia nervosa as an abnormally low body weight (15% below normal body weight for age and height), combined with a fear of gaining weight or becoming fat, preoccupation with body weight and shape, and amenorrhea or the absence of three consecutive menses. Although anorexic patients may engage in compulsive exercising, restrictor-type anorexic patients are distinguished by their resolute refusal to eat above a bare minimum. Bulimic-type anorexic patients regularly engage in binge eating and purging. Those who suffer from bulimia nervosa engage in binge eating followed by feelings of guilt, depression, and self-condemnation. The sufferer typically engages in behaviors referred to as "purging" to counter excessive eating; this behavior includes vomiting; fasting; using laxatives, enemas, diuretics, or other medications; and overexercising.

Theoretical Explanations

Early biological-medical theories of eating disorders emphasized individual factors, tracing the origins of eating disorders to chemical and hormonal imbalances that cause metabolic changes in the body, including depression and anxiety. Psychological models similarly recognize the biological origins of eating disorders but emphasize the impact of family and peer dynamics in childhood and adolescent psychosocial development. From this perspective, young women and girls develop disordered eating patterns as a way of coping with changes in their bodies that occur within the context of stressful social interactions and developmental environments involving families, peer groups, and educational and religious organizations.

Sociocultural models trace eating disorders to factors in the wider social environment, including the media and commercial interests that create social, cultural, and economic pressures on women to lose weight in order to conform to what may represent unrealistic standards of beauty and body size. These wider social forces are believed to be at the root of most eating disorders. They are powerful forces in shaping the behaviors of young girls and women precisely because females are rewarded for thinness both socially and economically. There are, for example, well-documented biases against "fat women" in the job market. By linking women's successes, their perceived value, and oftentimes economic survival, to culturally constructed standards of beauty, women are diminished and controlled in society. Within this wider sociocultural system, Hesse-Biber notes that the mind/body dualism in Western thought, as well as capitalist and patriarchal systems, encourage females to focus on the aesthetic value of their bodies and to neglect the development of their minds. Young females with anorexia, bulimia, and binge eating disorders thus become victims of a consumer-oriented culture that emphasizes the maintenance of a weight that lies below standards of good health.

Incidence and Prevalence of Eating Disorders

Estimates of the incidence and prevalence of eating disorders vary, no doubt because those who suffer from these disorders are often reluctant to reveal their condition. Despite the paucity of data, most of those who have researched or treated eating disorders agree that the incidence and prevalence of both anorexia and bulimia have increased markedly during the past 50 years. Some of this increase may be related to more awareness, hence greater identification of disordered eating.

Based on the available data, eating disorders are most common among young, middle- to upper-middle-class white women who live in more affluent countries. Epidemiological studies of anorexia in Western industrialized countries suggest an incidence of between 8 and 13 cases per 100,000 persons per year, but only an estimated 5% to 15% of these anorexic or bulimic individuals and an estimated 35% of those with binge eating disorders are male. Bulimic patients outnumber anorexic patients by at least 2 to 1. The prevalence of partial or restrictive eating disorders is at least twice that of full-syndrome eating disorders. Longitudinal studies suggest a progression from less to more severe eating disturbances, with normal dieters occasionally becoming pathological dieters who occasionally progress to partial or full-syndrome eating disorders. Although eating disorders are most common among young middle-class white females, anorexia is increasingly more common among young black and Hispanic women and girls.

Mortality Rates

The crude mortality rate among anorexics is estimated at 5.6% per year, approximately 12 times higher than the annual death rate for all causes of death among females aged 15 to 24 in the general population. Approximately 10% of people diagnosed with anorexia eventually die due to eating disorder–related factors. As self-starvation is a core feature of anorexia, high mortality rates are expected. However, anorexics are more likely to die from related medical complications, such as heart attack and electrolyte imbalance, than from malnutrition. For those with bulimia nervosa, the most commonly reported causes of death are car accidents and suicide. Among anorexics suicide is the second leading cause of death.

Attempted and Completed Suicide

It is estimated that 20% of patients with anorexia and 25% to 30% of patients with bulimia attempt suicide. The majority of studies find no difference between frequencies of suicide attempts among those diagnosed with anorexia as compared to bulimia. Other researchers do, however, report lower rates of suicide attempts in persons with anorexia than bulimia, with individuals classified within the binging/purging subtype of anorexia more likely to attempt suicide than those placed in the restricting dieter subtype.

Although suicide is common among anorexic sufferers, the number of completed suicides in persons with bulimia is negligible by comparison. The crude suicide mortality rate reported for persons with anorexia ranges from less than 1% to 5.3%. However, actual rates of anorexia-related suicide may be higher. Clinical correlates of suicide include purging behaviors, comorbid disorders such as depression and substance abuse, physical and/or sexual abuse, as well as other individual characteristics. For example, the best predictors of mortality among anorexia and bulimia sufferers is the extent of prescription drug abuse, illegal drug usage, and alcohol abuse.

Treatment Options for Eating Disorders

A range of options are available for treating eating disorders. However, for a number of reasons little research exists from which to document the success of these treatments. Treatment plans include medication, nutritional counseling, and individual, group, and/or family psychotherapy. Some patients also may require hospitalization or treatment in specialized treatment centers designed to address malnutrition, weight loss, and self-esteem issues. But individuals with eating disorders rarely seek treatment; they are often in denial and refuse to accept the serious nature of their eating problems.

Although anorexia nervosa is difficult to treat, some researchers suggest the use of antidepressants, antipsychotics, or mood stabilizers may be effective in alleviating mood and anxiety symptoms. However, others suggest that antidepressants are not an effective treatment for preventing patient

relapse. Most importantly perhaps no medication has been shown to be effective during the critical first phase of restoring a patient to healthy weight. Individual, group, and family-oriented psychotherapy may address some psychological issues while others suggest that family-based therapies are effective in assisting anorexic adolescents in working toward recovery. Others note that medical attention and supportive psychotherapy designed specifically for patients with anorexia is more effective, but whatever the treatment chosen its effectiveness may depend on case-specific criteria. Moreover, female testimony indicates that recovery is a slow process; improving body image and feelings of self-worth is an ongoing struggle. Treatment and prevention techniques that take a cultural approach to eating disorders show promise.

Similar to treatment for anorexia, treatment for bulimia depends on individual need. In an effort to reduce or eliminate binging and purging behavior, bulimic patients may undergo nutritional counseling and cognitive behavioral therapy or be treated for depression and/or anxiety. Medication also may be helpful in reducing binge-eating and purging behavior, reducing the chance of relapse, and improving eating habits. Again, recovery is a slow, ongoing process. Treatment and prevention approaches based on feminist therapies and media-awareness training show some promise.

Finally, the effective treatment of eating disorders requires therapists grounded in knowledge and techniques unique to these disorders. However, even the best therapists and health care givers are treating only the symptoms of culturally produced behaviors. Actions that seek to establish gender equality and altered representations of the ideal body shape, weight, and appearance will ensure a healthier population.

Apocalypse

Apocalypse is defined as a prophetic revelation. It is a description of the battle of Armageddon, the battle of good versus evil, as revealed in the book of Revelation of the New Testament of the Bible. In the Christian scriptures, Apocalypse means revealing or uncovering. The Apocalypse can be interpreted as a prophetic disclosure, as a lifting of the veil to reveal the true and living God in the fullness of truth. It can also be interpreted as the return of Christ and the defeat of His apocalyptic enemies.

Apocalypse is an important statement of faith that evolves throughout Hebrew life and in the writings of the early Christians. It is a vivid expression of eschatological teachings about *last things*, it is vindication for all who have trusted in God against the forces of evil and the forcing out of evil

to its final destruction, and it is the fulfillment of the establishment of the Kingdom of God.

The Concept Apocalypse as Sociocultural Symbol

As a cultural theme for literature and the media, apocalypse has been a popular source for many movie plots, movies like *Apocalypse Now, Resident Evil: Apocalypse*, *and Apocalypse II: Revelation*. Created with gimmicks, violence, and the battle between the forces of good and evil, these movies loosely speak of social instability, disasters, anxiety, and expecting God (or the movie star) to rise up and defeat the enemies. For some, such apocalypticism is a form of entertainment; for others it is considered a religious affront. Discussions of Apocalypse have divided religions, denominations, congregations, and families. Yet it remains an essential statement of faith and hope for many, with inclusion in religious creeds.

Apocalyptic Groups

In the contemporary experience, some people turn to the apocalyptic concept after catastrophes. For example, in the aftermath of Hurricane Katrina, some may have asked, "Is this the time?" There also are religious leaders who play on such fears and the despair of others to align potential membership with apocalyptic doctrine as the group leadership and congregation define it. Apocalyptic groups may emerge and then disappear, but they often share the common theme of believing that the future will lead them to a higher level of existence.

Among the more recent and notable of such groups was the Branch Davidian cult, a group from Waco, Texas, led by David Koresh, which came into direct violent conflict with U.S. Federal Bureau of Investigation in 1993. In 1997 members of the Heaven's Gate cult, led by Marshall Applewhite and Bonnie Nettles, committed suicide. Another such group was the People's Temple cult led by Jim Jones; the group migrated from the U.S. state of Indiana to California and then to Guyana in South America, where more than 900 members died, most by suicide. The leadership of each of these and similar apocalyptic groups promote the belief that the world will end on a certain date or at the time of a certain event, such as the appearance of the Comet Hale-Bopp on or about March 26, 1997. Contrary to most biblical teachings, or interpretations, many biblical scholars note that the Bible indicates that only God knows the exact day and time of the apocalypse.

The Biblical Approach to Apocalypse

The concept Apocalypse offers a dimension of hope, justice, and relief to an oppressed people. The Hebrew people faced rejection, war, oppression, and exile, much like the early Christians. For early Christians who worshipped in secret and faced certain death if discovered, the knowledge that Jesus would return soon and defeat all of their enemies was a measure of hope and vitality.

The Bible is rich in apocalyptic writings. Ezekiel, Isaiah, Joel, Zechariah, and Daniel were hotbeds of imagery that guided Judaism and were quickly adopted by the early Christians. There also were numerous writings in the intertestamental period that followed the closing out of the Old Testament and intervened before the start of the Christian story. Daniel spoke of the three who survived the fiery furnace. Joel spoke of a phoenix rising from the ashes. Ezekiel spoke harsh words of judgment to the Israelites in laments, warnings, and woes. In the New Testament, the four Gospels offer apocalyptic sketches, and the last book in the New Testament, the book of Revelation, focuses on the Apocalypse almost exclusively.

The book of Revelation (The Apocalypse of John) represents a pastoral attempt to bring hope and timely intervention (by God) into the violence of religious wars and other destruction. Some interpret this book literally as a specific script, word for word, of what the Apocalypse will be. Others assert that this book was written in a language based on the fear of further persecution.

Despite the many interpretations and divisions within the Christian church, the Apocalypse is often viewed as a doctrine of comfort and an invitation to bring people closer to God. Providing religious meaning to the man-made tragedies and natural disasters of life brings clarity for many to at least live with that which appears unbearable. The implication is that tragedy is an appropriate pathway to drawing closer to God through the

destruction of that which comes between God's love and, ultimately, human need.

Appropriate Death

Death is considered an appropriate occurrence of human experience when it is not out of place according to personal and cultural norms. Whether regarding our own death or the death of others, we always refer to a complex aggregate of many ingredients or criteria of appropriateness when we label a death. It is a person's concrete way of dying but also his or her life (one's age, self-fulfillment, and morality) that are concurrently referred to as quintessential conditions of appropriate death. Therefore, almost no death is experienced as fully appropriate.

Concept

The term *appropriate death* was introduced in the 1960s by clinicians. Their aim was to improve the care of the dying in a time when most people were in denial about death and talking about good death, by consequence, would be contradictory. Appropriate death has a more neutral connotation: It is a death that is to be accepted, as in the final stage of dying described by Kübler-Ross. Still, substantial confusion exists in the end-of-life literature on how to use the term *appropriate* and to differentiate it from other terms, including *healthy, peaceful,* or *natural*.

It is essential to recognize that the idea of appropriate death also guides, albeit as an unspoken or implicit label, how we all think, feel, and act in any experience of death and grief. Mainly scholars and practitioners of care for the dying use the concept of appropriate death in explicit terms, often with reference to a phrase of the psychiatrist Avery Weisman: It is "a death that someone might choose for himself had he a choice."

The concept is clearly relational: It is the social context that makes a specific death into an appropriate death and, even within the same time and space, a death can simultaneously be appropriate for some and inappropriate for others. Therefore, it is necessary to establish who defines appropriate death, that is, whether death is considered appropriate by the dying person, his or her family, physician, religious leader, or counselor. Moreover, the idea of appropriateness may refer to one's own death or to the death of another. Finally, it is important to ascertain whether appropriate death is related to the process of dying or to that of grieving.

Dying

In 1961 psychiatrists Avery Weisman and Thomas Hackett described four principal requirements of what they defined as appropriate dying. One who dies should have a reduction of conflicts; as little physical, emotional, and social pain as possible; a continuation of significant relationships; and a fulfillment of prevailing wishes. Weisman noted that although such conditions are almost beyond reach, it is still important to at least aim for a death that is as humane and dignified as possible.

The social perspective of appropriate dying is historically variable. Until a few generations ago, it was considered appropriate to die a saintly or religious death. It was associated with the last rites and with the presence of family and clergy at the deathbed. Such representation is still vivid for those who believe in a hereafter, and it is also popular in movies and other art forms. Yet, from the 18th century on, it was the doctor who became the practical manager of a profane death and who decided at what moment death had taken place. Whereas death in the 19th century was linked to moral judgment, in the 20th century evil was no longer connected to hell and sin, but rather to

illness and physical pain. The task of the hospital doctor was to deliver appropriate death by alleviating pain, rather than purifying one's soul. Finally, since the rise of palliative and hospice care and psychological discourses, natural death without protracted medical intervention is regarded as most appropriate.

Both euthanasia and suicide can be viewed as appropriate death for the person who wants to stop living, but suicide especially is regarded as traumatic and inappropriate. The appropriateness of euthanasia is still a matter of contentious debate. For instance, there is no agreement on whether euthanasia, commonly linked with unbearable physical pains, can also be the release from psychological problems. Further, appropriateness is questioned when the patient's autonomy is unclear, as is the case with children and people with dementia. Conversely, suicide, in some situations, is labeled appropriate death when it involves self-sacrifice or when it is considered a heroic act in time of war or when someone dies in the act of protest or nonviolent resistance. If death, however, is unwanted and occurs in a violent manner, it is typically not viewed as an appropriate death.

Age

Death at old age is typically considered appropriate death, as it is considered the natural and hence acceptable outcome of life. Young people often alleviate their fear of death, albeit unconsciously, by assuming that old people are closer to death than they are. As a result of improved standard of living (including food quality, personal hygiene, medical care, and safety) life expectancy has greatly increased. For that reason, becoming 80 years old is a normal expectation for the present generation. Since life is prolonged, dying is generally pushed forward, distanced, and associated with old age. Appropriate death is universally believed to follow the order of generations. As such, it is regarded as a natural law that parents should not survive their children.

Whereas dying at a young age tends to be less easily accepted and received as an unnatural fact, deaths at old age, in contrast, are typically romanticized through natural metaphors. Sayings like "he died in the fall of his life" and images of falling leaves on obituary cards affirm dichotomous thinking of life and death, spring and fall, youth and old age. Another consequence of linking appropriate death to old age is that staff members of a hospital may not give as much attention to elderly persons with a terminal illness as to children and youngsters who are considered to be heading for an inappropriate death.

Self-Fulfillment

An important principle that directs responses to dying and grieving in modern Western society is the notion of self-fulfillment. If one's life is thought to be complete, the individual is considered to have reached a stage where one is happy with life's accomplishments. In general, a long life of many memories is believed to exemplify the appropriate death while preparing the dying person to pass away. From this perspective, a person who is about to become a parent or has just been promoted to a sought-after position would not die an appropriate death.

It is sometimes argued that when death is seen as the definitive end of life with no prospect of an afterlife, more pressure is put on fulfilling one's life in the here and now. It would then be not so much death as such, but rather death before a full life has been lived that is feared. However, societies do not offer a consensus on what the goal of human life then would be. Life values are more than ever primordially derived from the authority of the self rather than from membership of communities such as the family and the church. Therefore, what makes a fulfilled and happy life for one person may not do so for another. Further, even or especially after a full and happy life, it would be reasonable to want to continue good times. Death after a so-called full life can be experienced as an intrusion for the family and friends of the deceased person, especially where the decedent played an important social role in the lives of relatives while living.

Morality

The label of appropriate death may also be morally inspired. For instance, in Catholic European contexts appropriate death followed a moral life of values such as piety, modesty, and selflessness. Until the 1950s local priests, writing the text for the obituary card to be distributed in their parish,

constructed the death of children and youngsters as a proper death, as they were regarded to follow a "life of devotion, guided by the light of the Holy Spirit, and inspired by the great love of God and fellow humans." Young people were expected to be prepared to die after a Christian life that had given them the key to the Gates of Heaven. From such a moral point of view, death at a young age was thus to be accepted even though the person had still a life ahead.

In particular contexts, death can also be constructed as the appropriate punishment for a life that is not judged moral. In some states and countries, the death penalty is considered appropriate by the law as punishment for certain categories of crime. However, as debates and protests prove in the United States, such moral evaluation of appropriateness is never without resistance. The same is true for the issues of abortion and euthanasia where religious groups oppose those who favor autonomy and decision making by individuals and doctors according to the specific nature of a situation. The idea of autonomy, on the other hand, is also the underlying principle of appropriate death when individuals are found responsible for unwanted death. For instance, a culture that glorifies health and fitness is not indignant about the death of a man who died from lung cancer when he was addicted to cigarettes.

Ariès's Social History of Death

Social attitudes and cultural responses to death have varied over time. Nowhere is this change more apparent than in the social history of death documented in the work of the French historian Philippe Ariès. Ariès's analysis of the social meaning of death in Western societies reveals that from the 18th to the mid-20th century in particular a cultural shift from collective social rituals of mourning to a less visible individualized appearance of death had taken place. Ariès argued that in the contemporary Western experience, death has become invisible and is not a topic that should be a matter of public discussion. Ariès's social history of death demonstrates that the historical public attitude toward death changed from that of a "tamed death," the view that death is open and should be anticipated and prepared for, to the attitude that death is forbidden, the modern view that death is a nondiscussed topic.

It was this thesis promulgated by Ariès of a forbidden public view of death that led to an increasing interest in the teaching and a proliferation of research in the area of death and dying that began during the early 1970s. Inspired by the meticulously documented work of the French historians Ariès and Michel Vovelle, during the final 3 decades of the 20th century and well into the 21st century, scholars and practitioners alike have addressed this important de-emphasis of death-related mourning rituals and the evolving role of hospitals, nursing homes, hospice organizations, and even funeral homes in the dying and death experience.

The published work of the French historian Ariès provided significant evidence that supported the common belief among intellectuals and scholars

that a profound cultural meaning had been lost in that the physical act of death and the fact of death were disappearing from public view. In Ariès's historical accounts covering 1,500 years, death indeed ended up being "invisible" and "wild," in contrast to its earlier "public" and "tamed" counterpart. Sorting out the chaos of the past, Ariès's vivid and comprehensive narrative of shifting attitudes toward death inspires many researchers to this day. However, since both the discipline of history and the social context of dying and bereavement have changed since his death in 1984, Ariès's history of death has recently also been criticized and supplemented.

History of Mentalities

Being a political reactionary and remaining long without academic position, Ariès remained in the ranks of French historians until the 1960s. Although he called himself a "Sunday historian," he not only gained a broad readership but also stimulated scholars to break new grounds. Touching upon formerly unexplored topics, such as the child, death, or sexuality, and using new approaches to the relationship between private and public life, Ariès indeed came to be respected as a pioneering and provocative figure in historical scholarship. He specifically contributed to a cultural approach within the Annales School, whose practitioners' aim was to lay bare underlying and long-term structures in history. For Ariès, these structures consisted not so much of socioeconomic realities, as stated by many of his contemporaries, but rather of *mentalités*: mental lives and attitudes that tacitly shaped the daily lives of particular groups or whole societies. His attempt was to grasp these fundamental aspects of the human experience that until then were largely considered without a history.

His traditionalist sentiments, on the one hand, and interests in demography, on the other hand, stimulated Ariès to study the private and everyday lives of ordinary people, hence revealing major shifts between premodern and present lifestyles and values. According to Ariès, the current day should serve as a point of reference to look at the past in order to understand the differences between now and then. This was also the case when he wrote his history of death.

The Modern Problem of Death and Grief

From diverse authors and publications in the 1950s, 1960s, and 1970s, Ariès learned how both dying and grieving had become new problems of the human experience. For instance, Ariès cites psychiatrist Elisabeth Kübler-Ross, who caused a shock with her best-selling book *On Death and Dying,* mirroring the "humane" and "natural" death she knew from her childhood to the later controlled and institutionalized dying at the hospital. Other sources of inspiration were psychologist Herman Feifel, sociologists Barney G. Glaser and Anselm L. Strauss, and philosopher Ivan Illich who shook up intelligentsia with their outcry against the alienation of terminally ill patients. Neither was Ariès alone in his concern about the estrangement of grieving survivors. Already in 1955, anthropologist Geoffrey Gorer had stated that the 20th century no longer gave free rein to death, just as the Victorian Age had banished sexuality. Without any ritual scripts at the hour of death, bereaved people were thought to be let down, by consequence, distressed by psychological problems. Likewise, Ariès was impressed by *The American Way of Death*, written by investigative journalist Jessica Mitford, who denounced the insensitive profit seeking of mala fide funeral undertakers.

Among others, Ariès found that the apparent medicalization and commodification, but also the social processes of technologization, secularization, and individualization, considered typical of the modern society he was living in, had pernicious influences on the experience of death, dying, and grief. Once human beings were surrounded by a less natural world, once they could no longer fall back either on a shared system of meaning-making, as formerly offered by the churches, or a sense of security, previously served by a community like a neighborhood or parish, they were just on their own in their encounter with death.

Before he wrote his *Western Attitudes Towards Death,* a small book that brought together a series of lectures from 1974, Ariès was already famous for his history of the child and the family: In his *Centuries of Childhood* he applied visual evidence to claim that only in the 17th century was the concept of "childhood" originated. *L'homme devant la mort* (literally "Man in the Face of Death"), an ambitious book of more than 600 pages published

in 1977 and later translated in English as *The Hour of Our Death*, offered a challenging overview of attitudes toward death from the Middle Ages to the present.

Issues

Ariès organized his monumental book, *The Hour of Our Death,* about changing mentalities around four psychological issues: awareness of the individual, the defense of society against untamed nature, belief in an afterlife, and belief in the existence of evil. Drawing on many different sources, including literary, liturgical, archaeological, and iconographic materials, Ariès thus constructed sequential attitudes toward death: the tame death, the death of the self, remote and imminent death, the death of the other, and the invisible death.

The Tame Death

This first model describes death as a simple, familiar, and taken-for-granted human experience. According to Ariès, in premodern Western societies death was accepted as an inevitable part of life. Mainly building on passages from literature, such as the romance of chivalry, Ariès constructs this attitude as one without a clear history: It describes the human being, basically situated in archaic or so-called primitive societies, who knows death is about to occur and who is surrounded by a community. In the experience of tame death, the dying person controls the act of dying, resignedly accepts the nearing death, and passes away restfully facing heaven.

The Death of the Self

The first violation of this tamed death occurred during the late medieval times when the dying person became increasingly concerned about his own destiny in the hereafter. Especially for the elite, life became an exercise in redemption and the *ars moriendi* (art of dying) under the wings of the Church. Death became "one's own death": The acceptance of a natural order and collective fate of humanity was put under pressure by a growing attention for individuality and one's own salvation. The act of dying hence became the quintessential moment of an emerging self-consciousness.

Remote and Imminent Death

By the end of the 16th century a reversal of death started to appear. This is the real turning point of the long-term history of mentalities, not yet included by Ariès in his *Western Attitudes Towards Death:* Whereas before, death had been immediate, familiar, and tame, during the Enlightenment it gradually developed into a distant, secret, and violent phenomenon. By its remoteness death became fascinating and often even erotic. It might seem a surprise that such "savagery" returned in the Age of Reason. However, it was exactly the faith in progress and its triumph over nature that confused the traditional barriers of life and death, hence evoking the fear of being buried alive.

The Death of the Other

In the 19th century a new feeling came about alongside new conceptions of the family: In the hour of death, the focus was no longer on one's own ending but on the death of the other. Death, on the one hand, was increasingly experienced as a problematic rift between the dead and survivors. Grief, on the other hand, was no longer ritually constrained by the community; it became "hysterical" and "insane." Excessive expressions of emotion pointed at the difficulty of the bereaved to accept the death of intimate ones. The memorializing of the dead endorsed them with a sort of immortality; the grave became the site where the dead were visited as if still alive. No longer associated with evil but with beauty, death became romanticized.

The Invisible Death

Finally, in the beginning of the 20th century, a psychological climate arose in which death was radically distanced from the public area thus becoming "hidden" and "reversed." In the hospital, the dramatic act of dying was segmented in several small steps and, therefore, disappeared. The familiarity with funeral rites diminished; tears became morbid because they disturbed the illusion of happiness—since the Enlightenment the breeding ground of the taboo. Hence, grief expressions were shameful and had

to happen secretly. Mourning attire vanished from street scenes and children were protected from sorrow. With the rise of cremation, the dead could no longer be visited at the gravesite or be memorialized. Because of the loss of traditions, Ariès stated, modern society had trouble in facing mortality.

Relevance and Critiques

Ariès's social history of death has been of great importance to a broad audience of readers, including scholars. Never before had the Western history of death been captured in such a precise way. His history is still challenging and still makes excellent reading for its original interpretations of materials and the iconographic culture of death. Nevertheless, the writings of the "historian of death" have also been questioned.

Although his discussions of especially French and medieval sources are thorough, Ariès has been blamed for generalizing and extrapolating his empirical data. Furthermore, because it downplays both the active role of individuals and the dynamics of social practice, the concept of "mentalities" is no longer in vogue among historians. Also, his hydraulic metaphor of emotions—the underlying model of his long-term history, which takes emotions as natural liquids that are let out and controlled in culturally specific ways—has been superseded.

Still, it was his depiction of modern death and grief ways, in contrast to traditional ones, that has especially been the subject of attention and controversy. Tamed death is now being deconstructed as a romantic and nostalgic imagination of a mythical past and a noble savage. According to recent social studies, death and grief rituals have not disappeared or grown poorer, as stated by many cultural pessimists including Ariès, but rather they have changed and moved to other places. Because present ways of living and cultural contexts are radically different from medieval ones, it is perceived evident that people also die and mourn differently. Indeed, since the publications of Ariès, social settings of dying and bereavement have changed. Diverse new initiatives came into being, including palliative care for the dying and support groups for grievers. The amount of research, education, and information on dying and grieving has expanded. In other words, the loss of one tradition, such as the wearing of mourning attire, does not point at the loss of death culture as such, but rather at its transformation.

Also in premodern social contexts, the death of a loved one could be a troublesome event, and it is also nowadays dealt with in meaningful ways. Hence "good death" and "appropriate grief" cannot be primordially equated with one content, form, and context—such as Ariès's model of tamed death—but are always socially constructed. How a society ritually deals with death and loss, and hence makes sense of them, is historically variable. Before the 1960s, particular types of death and grief could be "disenfranchised." For instance, as long as religion permeated all aspects of life in Western Europe, stillbirth and suicide were dealt with rather secretly: Public expressions of grief were considered improper when death was considered God's will or a violation against it. From such a perspective, death cannot be understood to have had one linear narrative of downfall. It does not have one history, but rather it has multiple histories.

Armageddon

In the New Testament, the book of Revelation, chapter 16, verse 16, is a reference point for the concept of the battle at the mountain of Armageddon. Armageddon (*Harmagedon* in Greek) refers to the big war that will take place on the great day of God. Armageddon is the final battle between good and evil, the ultimate triumph of Christ. Defined in the Hebrew as *har* (mountain) and Megiddo (city in ancient Palestine), the concept Armageddon, referred to in the Old Testament as a military stronghold, is based on two verses from Christian scripture that have emerged as a part of Christian eschatological beliefs. In the Bible, mountain is symbolic of a kingdom, and the battle at the mountain of Armageddon will bring about God's kingdom.

For Christians, Armageddon is the final battle among all the armies of the world; it is the ultimate battle between good and evil. For some, Armageddon is dramatic and it is an imminent event that unites Christians. For others, Armageddon is simply part of the biblical history that represents an exaggerated series of statements from another time period that have been stretched beyond reality.

Religion and the Armageddon Concept

Biblical topics have often been cause for debate if not some confusion. Clearly, the Bible was written at a time when the church was in its infancy, the membership was sometimes persecuted, and believers anticipated relief from persecution with the Second Coming of Christ.

This emphasis on war and victory of good over evil, in which good will conquer evil, finds further support in brief references in the Old Testament, namely Judges 5:19 and 2 Kings 23:29. Many biblical scholars adamantly believe the battle at Armageddon will fulfill biblical prophecy.

Many religious thinkers insist that if Armageddon is referred to in the Bible then it is true, thus making this truth imperative for belief, and to question the veracity of the battle of Armageddon is to question other biblical writings. Armageddon also represents a political and religious affront in the Middle East because, it is argued, Western nations tend to offer support to Israel because of the religious symbolism Megiddo holds for Christianity as the site of the final battle. This pro-Israel orientation represents a juxtaposition between religion and political issues. Thus, the chasm is increased between the Christian community, the Middle East, and other religions of the world.

The whole concept of the war of Armageddon moves some individuals away from God because it gives them cause for confusion and despair. On the other hand, there are those Christians who argue that the war of Armageddon is the fulfillment of God's promise to return and claim His believers unto Himself.

Signs of the Coming of Armageddon

The Bible details many signs and wonders that must come to pass prior to the battle at Armageddon. Some religious teachers assert that man-made disasters such as the Holocaust, the terrorist attacks of September 11, 2001, as well as natural disasters such as earthquakes, tsunamis, and hurricanes are prophecies of Armageddon. Fictional writings, such as *The End of Days: Armageddon and Prophecies of the Return* as well as the *Left Behind* series of books that was made into a movie by that same title, promote a similar theme. Many religious and biblical teachers insist these events are prophecies that need to be heeded and fulfilled before the occurrence of the battle at Armageddon, asserting that they are a sign of God's imminent return.

The book of Revelation was said to have been written by John who, because of his Christian faith, was exiled to the Roman penal colony at the Island of Patmos. The book of Revelation is an account of visions revealed to John by God in symbolic and allegorical language borrowed from the Old Testament, especially the books of Ezekiel, Zechariah, and Daniel. The symbolism expressed in Revelation was apparently popular at the time. The book of Revelation was created amid a time of crisis, yet its central message to Christians holds true today: Stand firm in the faith, God will return, and continue to persevere in hope despite a troubled world.

Art of Dying, The (*Ars Moriendi*)

Ars moriendi, literally "art of dying," refers to a genre of Christian devotional literature that enjoyed widespread popularity across Europe from the 15th to the 18th centuries. These works had a fundamentally practical orientation, aiming to advise the dying regarding how they might avoid despair at the end of life and thereby avoid the damnation believed to await those who faltered in faith. Over time the genre expanded its focus beyond the deathbed by describing also how one's manner of dying was often decisively affected by the habits of living developed over one's lifetime. Scholars of religion study the ars moriendi tradition because it is one of the great genres of Christian devotional literature, but these writings appeal to a broader audience because they offer glimpses of what the experience of dying was like in Renaissance Europe. The ars moriendi reveal what Europeans from this era saw to be the central existential challenges of dying, and provide detailed accounts of their strategies for meeting those challenges.

Origins of the Tradition

The roots of the ars moriendi tradition can be traced to two anonymously written works: the *Tractatus artis bene moriendi* and a shorter, later work known simply as the *Ars Moriendi,* which combined an abridged version of the *Tractatus* with a series of woodcut illustrations depicting the struggles of the dying against various temptations. Both works enjoyed enormous popularity during the 15th and early 16th centuries. The *Tractatus* was written circa 1415 and later translated into every European language. The influence of these works extended far beyond their direct readership because many preachers drew heavily upon them when offering sermons on preparing for death. For example, Girolamo Savonarola preached *Predica dell'arte del ben morire* to large crowds in 1496. It was later published and circulated among clergy who put it to further use in their own preaching.

Historical Context

The popularity of the ars moriendi can be explained in part by the fact that interest in death was already very high before these works were published. Plague, warfare, and food insecurity had long made clear the constant proximity of death, and reflections on the power of death were common in popular religious practice. It was typical at this time for preachers to exploit their listeners' fear of death in order to move them toward religious conversion. The *Danse Macabre,* in which a personification of death (usually a cadaver) led people of all classes as captives, was a popular example of the times' fascination with death.

Tone, Structure, and Content

In contrast to the often graphic, macabre treatments of death that predominated at the time, the *Tractatus* strikes a consolatory tone. It does not represent death as something natural or unequivocally good, but its focus is not on death's horrors. Instead, the *Tractatus* portrays dying as a final, challenging task that one can do well or poorly. The deathbed provides the setting for a battle between God and Satan for possession of one's soul. The block prints of the shorter *Ars Moriendi* depict this battle vividly. In an emblematic illustration, a man lies upon his deathbed, surrounded by angels and friends on one side and demonic creatures on the other. Thus the dominant image of dying in the *Ars Moriendi* is that of monumental struggle, but a struggle against spiritual and moral weakness rather than against disease or death itself.

The central piece of advice in the *Tractatus* is to endeavor to die gladly and willfully. The text

assumes dying to be a painful, frightening experience, but attempts to soften these facts by putting them into a Christian context. The pain of death is recast as a just punishment for sin sent by God. The reader is asked to ponder how even weeks of suffering on one's deathbed would pale in comparison to the torments of eternal damnation that would result from failing to die gladly. One should surely prefer to accept physical punishment from God in dying rather than experience God's everlasting vengeance beyond the grave.

The *Tractatus* comprises six chapters:

1. General advice and sayings from Christian and classical sources regarding how to die well
2. Advice about how to overcome the temptations of unbelief, despair, impatience, pride, and avarice
3. Interrogations that encourage the dying to acknowledge their sinfulness, promise to repent, and affirm their faith in God's mercy
4. Prayers and instructions that direct the reader to imitate the way in which Jesus died (e.g., by commending one's soul to God, by dying willfully, and so on)
5. Advice to those at the bedside
6. Prayers to be said at the moment of death by those present at the bedside

Throughout these chapters, the discussion of how to face the trials of death is somewhat sterile and mechanical. The reader is not moved to faith or patience or hopefulness so much as told of the importance of those dispositions. The author of the *Tractatus* sees a sophisticated understanding of Christian faith to be unnecessary for salvation; instead, the worth of one's faith was measured by a willingness to affirm the creed and the teachings of the Church.

It can be inferred from the *Ars Moriendi* that dying was a decidedly public affair in 15th-, 16th-, and 17th-century Europe. The *Tractatus* assumes that friends play a vital role in helping a person die well. They help the dying leave this world willingly by assisting them in setting their affairs in order: finalizing a last will and testament, facilitating reconciliation between the dying and estranged relations, and so on. In addition, friends were to nurture the spiritual well-being of the dying. The *Tractatus* instructs those at the bedside to recite the creed in a loud voice whenever the dying falter in faith, recommends holding a cross before the eyes of the dying as a means of encouragement, and prescribes the recitation of many prayers.

Evolution of the Ars Moriendi Tradition

Erasmus: From Ars Moriendi to Ars Vivendi

During the 16th century, some of the brightest theological minds of the time contributed to the growing corpus of the ars moriendi tradition. Desiderius Erasmus was the first eminent theologian to improve upon the *Tractatus*, publishing *De praeparatione ad mortem* (Preparing for Death) in 1533. He dramatically improved upon the often artless prose of the *Tractatus,* and made a major contribution by highlighting the importance of the art of living well (the *ars vivendi*) as a means of preparing to die well. Erasmus's decision to focus heavily on the ars vivendi set a trajectory that would be followed by most subsequent works in the ars moriendi tradition.

Whereas the author of the *Tractatus* was certain that a person's eternal fate was determined by his or her disposition at the moment of death, Erasmus believed that no one should be judged by their manner of dying. Nevertheless, he devoted considerable attention to dealing with the difficulties of the deathbed; however, he did so not to provide a recipe for attaining eternal salvation. Instead, Erasmus's aims were to provide comfort and to lead Christians to see preparation for death as an opportunity for spiritual renewal throughout life. He sought to provide comfort primarily by suggesting that if one could learn to put one's trust entirely in divine mercy and compassion, the fear of death would melt away.

Erasmus offers a clearer portrait of the psychological torments suffered by the dying than can be found in the *Tractatus*. He composed a dialogue in which the devil taunts the dying, playing upon their fear of the unknown and upon the Christian notion of God's justice: How could a just God admit such an imperfect person into paradise when that person certainly deserves punishment? Erasmus suggested that the key to helping the dying meet

the temptations of the deathbed was to find a prudent spiritual counselor (usually a priest, but occasionally a wise friend) who would offer consolation while avoiding false flattery. By finding such a balance, the dying could learn to repent of the mistakes they had made during life without slipping into despair.

Jeremy Taylor's Holy Living and Holy Dying: Pinnacle of the Tradition

As the ars moriendi tradition began to flourish after the time of Erasmus, the Protestant Reformation divided Western European Christianity. The ars moriendi enjoyed enormous popularity among both Catholics and Protestants. Tracts were authored by theologians from across the spectrum of Christian denominations. Among the notable Protestant works were those by Thomas Becon and William Perkins (English Calvinists). Juan Polanco and Robert Bellarmine authored two of the finest and popular Roman Catholic tracts. Scores of other works were written but many who have studied this literature agree that *The Rule and Exercises of Holy Dying* by Jeremy Taylor (an Anglican) stands as the tradition's preeminent work.

Taylor artfully draws upon Christian and classical sources, placing considerable emphasis upon the need to prepare for death throughout life. One must make a lifelong effort to grow in patience (the ability to endure suffering steadfastly) and in faith (which would allow one to trust in God's love and mercy). To endure the pain and loss that comes with death, one must have learned how to endure life's smaller tragedies. To trust in God to preserve oneself through death into eternal life, one must have built up a strong attachment to God throughout life. Thus Taylor had a profound sense of the importance of habituation. One develops habits of patience, faithfulness, and hope so that one can remain patient, faithful, and hopeful in the agony of death. To promote this sort of growth, Taylor offers a sophisticated combination of meditations and concrete practices. His meditations are reminiscent of the approach to contemplation developed by Ignatius of Loyola (16th-century Roman Catholic); they speak to both reason and emotion while drawing deeply upon the use of imagination.

Taylor was an advocate of *momento mori*, or remembering death. This practice cultivated awareness that death could come at any time and entailed evaluating life choices according to whether they furthered or hindered progress toward spiritual growth and the ability to die well. Another key practice for Taylor was attending to the dying. Being present at the deathbed served the dying by offering them vital support, but also provided caregivers with an excellent means of preparing for their own death. This practice served as a form of momento mori and offered the opportunity to learn to die well by imitating the graceful death of friends and family.

Taylor's work was the last great book in this genre. No subsequent author equaled Taylor's artful rendering of the tradition or his masterful use of both classical and Christian sources on dying well. Taylor's work and some tracts that preceded his remained popular for generations until interest in the genre declined in the 19th century.

Assassination

Assassination is an ambiguous concept when used to describe events or when it is employed in general analyses. Assassination is selective killing; it also refers to the intentional killing of a public figure. These two views of assassination share the element of killing and are similar to the extent that the expressions "a leader" and "a public figure" refer to similar types of people. But they are also different from each other. Notice that according to the second definition, but not the first, assassination is a killing accomplished treacherously; this introduces into the second definition a dimension that is not present in the first one, namely the evaluative dimension. Unlike murdering, the notion of killing is purely descriptive. An act of killing can be evaluated as a morally or legally permissible or even an obligatory act, under certain circumstances of self-defense and necessity, but can also be evaluated as a morally impermissible or even abhorrent act, under circumstances of wicked aggression. The adverb *treacherously* is on a par with murdering rather than killing. To act treacherously is to act in a wrongful way. It is never justifiable. Recall Dante's attitude toward treachery in the Inferno part of his *Divine Comedy.* The circle of treachery is the ninth and final circle of hell. In its innermost zone and within Lucifer's mouths were Brutus and Cassius, eternally suffering for their assassination of Julius Caesar.

Consequently, a deep distinction emerges between a definition of assassination as a selective killing of a leader and a definition of it in terms of what is accomplished treacherously. Whereas the former definition leaves open questions of the justifiability of acts described as assassination, the latter definition leaves no room for any question of justifiability, since an act described as assassination involves treachery, which is always wrong. When the former definition is used, moral issues can and often should be considered. When the latter definition is used, it is pointless to raise such issues. A moral consideration has already been made and a negative evaluation reached. As a result of that deep difference between various definitions of assassination, we have an induced difference between discussions that employ, whether explicitly or between the lines, different definitions of the term.

The important distinction between descriptive and evaluative definitions of assassination is often blurred, when evaluative terms appear in seemingly simple conjunction with descriptive ones. For example, *assassination* is to destroy unexpectedly and treacherously a specific human target. A depiction of an act as performed unexpectedly is purely descriptive, even though it involves expectations, which are possibly subjective. However, a depiction of an act as performed treacherously involves both a description and an evaluation. Similarly, assassination represents a deliberate action that involves extralegal killing that is based on political ideologies. Assuming that an act can be extralegal and morally justified, the question is left open whether a certain act of assassination was morally justified or not, but the normative question of its legal nature has been closed by definition.

Given such a variety of definitions of the notion of assassination, preference must be given to one definition, or one family of similar definitions, in order to discuss assassination by giving examples of such acts, searching their meanings, and evaluating their justification. It has been demonstrated that there is a reason to prefer usage of terms that enables us to draw a distinction between a description of an act, activity, or event and its evaluation from a certain normative point of view, thus making the nature of the evaluation transparent. When descriptive terms are used, the mode of evaluation has to be introduced in a way that enables seeing the grounds of it. If evaluative terms such as *treacherously* are used, the grounds for portraying a certain act or policy as wrong are left unstated and remain unclear. Hence, in the sequel, assassination is going to be understood in a broad sense that leaves open for further discussion issues of moral, ethical, religious, or legal justification.

The difference between definitions of assassination that include a conveyed evaluative element and those that do not is not the only difference one encounters in the usage of the term and in its suggested definitions. Here is a list of features that appear in usage and analysis, some of which are necessary conditions for the occurrence of an act described as an assassination and some of which are not:

1. Killing a person
2. Killing a political leader
3. Killing a noncombatant

4. Doing it selectively
5. Doing it intentionally
6. Doing it in a premeditated manner
7. Doing it for political or religious purposes
8. Doing it unexpectedly
9. Doing it by a person not in uniform
10. Doing it in a secret and clandestine manner
11. Doing it treacherously

Given the background of the previous discussion, number 11 will not be included in the definition, thus leaving the question open whether an act of assassination under consideration is of a treacherous nature or not.

Some of the other 10 suggested definitional elements of assassination are features of common instances of what is called an assassination rather than necessary ingredients of the concept of assassination. For example, because an instance of an expected assassination can be imagined, element 8 of the list should not be an ingredient of an adequate definition. For similar reasons, ingredients 3 (an assassination of a head of state can take place whether or not the person is commander in chief, of a military rank, or in military uniform), 9, and 10 can be discarded as well.

Element 1 is indeed a necessary ingredient of the definition. Element 2 is problematic, as the term *assassination* has been used for describing acts of killing people who did not play any political role of leadership at the time of the killing. Paul Klebnikov wrote a book about corruption among Russian so-called oligarchs. Although he held no political position, whether formal or societal, his killing was later protested as an assassination. On the background of such examples, it is proposed that element 2, "killing a political leader," be replaced by the broader "killing a person of prominence," that could be political but not necessarily so. Element 7, "doing it for political or religious purposes," does not presuppose that the person killed is a political leader. Prominence is sufficient for rendering an act of killing, an act that can be intended and understood as done for political or religious purposes. This leaves elements 1, 2 (modified), 4, 5, and 7. Element 6 has been deleted as it can be included in element 7; what is done for political or religious purpose is necessarily premeditated, in a sense. Element 7 includes not only political reasons but also religious ones, as suggested by the Canadian Forces manual on the Law of Armed Conflict.

Thus, the following working definition of the term *assassination* is proposed for the present purposes: An assassination is an act of killing a prominent person, selectively, intentionally, and for political or religious purposes. This definition leaves open all questions of justification. An act of killing a prominent person, selectively, intentionally, and for political or religious purposes can and should be evaluated from any relevant point of view, be it moral, ethical, legal, or denominational. Notice that some of these points of view may vary in time. For example, the legal point of view of the United States, before the related Executive Order of President Ford, which banned assassination performed on the behalf of the U.S. government, later formulated in Executive Order 12333, is different from the present legal point of view of the U.S. government, assuming it has not been changed.

Examples of Assassination

Greece

King Philip II of Macedon conquered Greece, except for Sparta, in 338 B.C.E. and was about to fight Persia. During a wedding ceremony of his daughter Cleopatra to the King of Epirus in 336 B.C.E., he was killed by Pausanias, one of his bodyguards. According to some historians, it was an assassination in which his wife Olympias was involved. His son was Alexander the Great.

Rome

After successful battles, extended from Italy to Spain, Greece, and Egypt, Julius Caesar became, in 44 B.C.E., a self-declared dictator for life. Numerous Roman senators turned against him and conspired to assassinate him. When he came to a Senate meeting on the Ides of March 44, some senators, including Servilius Casca, Cassius, and Decimus Brutus, stabbed him to death. One result of the assassination was a series of civil wars.

Hellenistic Egypt

Hypatia, daughter of the philosopher and mathematician Theon of Alexandria, was the first

woman to be head of a philosophical school and to be known to have broad mathematical knowledge. Her special personality and her friendship with the Roman prefect Orestes served followers of the Christian Patriarch (later St.) Cyril as grounds for depicting her as responsible for the political rivalry between patriarch and prefect, Church and State. In 415 C.E., a Christian mob, possibly of Nitrian monks, assassinated Hypatia.

Medieval England

King Henry II appointed to the most influential position of chancellor his friend of "one heart and one mind," Thomas Becket. After Archbishop Theobald died in 1161, the king thought Thomas would help him reform the church. In 1162 Thomas was ordained priest and a day later consecrated bishop. However, as the archbishop of Canterbury, Thomas's first loyalty was to the church. In a series of events he was in conflict with the king. In 1170 four knights assassinated him in the cathedral. Two years later he was canonized.

The Netherlands

William I, Prince of Orange ("The Silent"), was governor of Holland under Philip II, King of Spain's occupation of the Netherlands. Later, he led a Dutch revolt against Spain, which led to the Eighty Years War between the two, which in turn led to the 1648 independence of the Netherlands. He was assassinated by a Catholic French supporter of the king of Spain in 1584. The Dutch national anthem, flag, and coat of arms are directly related to the "father of the fatherlands."

Russia

Emperor Paul I, son of Emperor Peter III and Catherine ("The Great"), formed the Second League of Armed Neutrality with Prussia, Denmark, and Sweden but was rigidly conservative in internal affairs. He was assassinated in 1801 by dismissed officers and other officials led by Levine August, Count of Bennigsen, and a general in the service of the emperor. The assassins declared emperor his son, Alexander I (eventually, "The Blessed").

The United States

Abraham Lincoln, the 16th president of the United States, defeated the Confederate States of America in the Civil War. His executive orders, "Emancipation Proclamation," were significant steps toward ending slavery in the United States. On that background, a Confederate agent assassinated Lincoln on April 15, 1865, while coconspirators failed to assassinate Vice President Andrew Johnson and Secretary of State William H. Seward.

World War I

Archduke Franz Ferdinand, heir apparent to the throne of Austria-Hungary, was assassinated in Sarajevo, on June 28, 1914, by a Serbian group interested in the independence of Serbia. Within a few weeks, a war erupted between Austria-Hungary and Germany, on the one hand, and Serbia, Russia, France, and Great Britain, on the other hand, which lasted more than 4 years. Many other states joined the war, among which were the United States and Italy. The number of military deaths is estimated between 9 and 10 million, that of civilians between 8 and 9 million.

India

Mohandas Karamachand ("Mahatma") Gandhi was born in India, educated in England, and experienced discrimination during a long stay in South Africa, where he developed his political position of nonviolent struggle. Upon returning to India, he led the struggle against the United Kingdom, for the independence of India. His insistence on nonviolent methods and his religious tolerance enraged some Hindu fundamentalists, who made five attempts to assassinate Gandhi. On January 30, 1948, he was assassinated, in Delhi, on his way to a prayer meeting.

On October 31, 1984, India's prime minister, Indira Gandhi, was assassinated by a Sikh bodyguard, on the background of a conflict related to Sikh temples. Her son, Ragiv Gandhi, immediately followed her as prime minister. On May 21, 1991, after resigning from office, he was assassinated by a female suicide bomber, a member of a Tamil extremist organization.

Israel

After the Oslo accords were signed by the Government of Israel and the Palestinian Authority, which involved prospects of Israel's withdrawal from belligerently occupied Palestinian territories, Israeli Prime Minister Yitzhak Rabin was assassinated, on November 4, 1995, by an extremist, nationalist-religious Jew. The assassination was followed by changes in the ruling party, government, and policies.

Meaning and Justification

Every case of assassination involves, by its nature, causing the death of a prominent person for political or religious purposes. However, the full meaning of an assassination has an additional element: An assassination can be instrumental or symbolic. In the former case, the death of the assassinated person is a necessary condition for achieving the purpose of the act. The assassination of Julius Caesar is an example as are most of the previously mentioned cases. In the latter case, an interpretation of the assassination is meant to be understood by members of the groups directly related to the political or religious purpose of the act. The assassination of the Archduke of Austria-Hungary, for example, was not a necessary precondition of the independence of Serbia, but it stood for the struggle of some Serbians for their political independence.

Moral evaluation of an act of assassination depends on the full intended meaning of the act. The simpler cases are the extreme ones. On the one hand, if it can be certainly assumed that the assassination will radically change for the better a horrendous state, such as an ongoing genocide, by removing from power, in the only way possible, a person who is responsible for the atrocities, then assassination is permissible. The case of Hitler during World War II is a prime example. On the other hand, assassination meant for symbolic purposes is always morally wrong, because it involves treating a person as merely a means to an end.

Symbolic acts of assassination are never necessary and always have better alternatives.

U.S. Executive Order 12333, which forbids acts of assassination of or on the behalf of the United States, marks a presumption that such acts are usually morally wrong. Reasons for such a stance with respect to intermediate cases have involved a variety of considerations. Because heads of states are often not members of the armed forces, the Principle of Distinction between combatant and noncombatants has been invoked. This is not a compelling argument, as heads of states are often directly involved in crucial warfare decision-making processes. Some analysts argue that persons with whom peace will eventually be negotiated and reached should therefore not be assassinated. When assassination is meant to terrorize people, the arguments against terrorism convincingly apply against it. Usually, assassinations cannot be justified on grounds of necessity and therefore are understood to be symbolic in nature and therefore morally wrong.

Assisted Suicide

The 20th century, with its rapid progress in medical science, has fundamentally changed the nature of the dying process in much of the Western world. Modern advances in medicine and life-sustaining technology have resulted in a dramatic increase in life expectancy and quality of life. However, these changes have also given rise to the concern that the dying process may be unnecessarily lengthened, leading to prolonged suffering and loss of dignity for many terminally ill individuals. This concern has increased public interest in the legalization of a range of end-of-life practices, including assisted suicide.

Terminology

Assisted suicide is defined as a situation in which a person with an incurable, terminal illness requests the help of others in ending his or her life. The person providing assistance typically supplies the terminally ill patient with the means or information necessary to bring about death. When such assistance is provided by a physician, the practice is referred to as physician-assisted suicide (PAS). Assisted suicide and PAS are often confused with another end-of-life practice, euthanasia. Specifically, euthanasia refers to the act of taking another person's life with the aim of alleviating suffering. Assisted suicide and euthanasia are distinctly different practices, because PAS allows patients to be the active agents in controlling the circumstances of their death, whereas in euthanasia, the person who performs the actions leading to death is someone other than the patient. Another practical distinction is that PAS usually involves a physician's prescription of a lethal dose of medication, whereas euthanasia often involves the administration of a lethal injection.

Arguments About Assisted Suicide

The distinction between assisted suicide and euthanasia is significant, given the heated nature of the debate surrounding legalization of assisted suicide. A number of arguments have been voiced in the public discussion surrounding this issue. Proponents of legalization argue that individuals have a fundamental right to personal autonomy and that assisted suicide allows terminally ill patients to maintain dignity and control at the end of life. It is further suggested that PAS can address terminally ill patients' concerns with maintaining autonomy and quality of life, whereas pain control interventions and palliative care may be ineffective in resolving these concerns. In addition, proponents argue that assisted suicide already exists as a hidden practice, so legalization can ensure that appropriate monitoring and safeguards are enforced. Finally, PAS advocates suggest that practices that relieve suffering and respect patients' autonomy are consistent with the physician's role and conform to current ethical and medical principles.

Opponents of legalization, on the other hand, often cite the sanctity of human life and the moral unacceptability of suicide as arguments against assisted suicide. Providing assistance in a patient's suicide is explicitly prohibited by the Hippocratic oath, and some view PAS as inconsistent with the physician's obligation to preserve life. Apart from such moral and ethical objections, opponents often argue that adequate palliative care and pain management can eliminate patients' need to resort to assisted suicide. They also voice a concern that the legalization of PAS may stifle progress in the hospice movement and thwart current developments in end-of-life care. Some fear that the legalization of PAS may put pressure on patients to choose assisted suicide in order to avoid becoming a burden to family and caregivers. Finally, opponents point to the danger of a slippery slope—the concern that, over time, PAS may be applied to those who are not terminally ill, as well as those who are physically disabled or have a mental illness.

The Practice of Assisted Suicide

Given the heated nature of the debate surrounding the legalization of PAS, it is no wonder that this practice is a legal option in only a handful of countries. At the time of this writing, only the Netherlands, Belgium, Switzerland, and the U.S. state of Oregon have implemented legal regulations that explicitly permit PAS. Some important differences exist in the way PAS is practiced in

each of these areas of the world, so a discussion of cross-national variations is warranted.

The Netherlands has a long history of legal tolerance toward PAS and euthanasia, and both practices were eventually legalized in 2001 with a law passed by the Dutch Parliament. Under this statute, physicians can perform either euthanasia or PAS in cases where a patient has made repeated, voluntary, and well-considered requests and perceives his or her suffering as unacceptable. The physician must be convinced that the patient's situation is desperate, although a terminal medical condition is not explicitly required. Furthermore, the attending physician needs to consult with a colleague as well as document and report all actions taken. When parental approval is provided, the Dutch law also permits PAS for patients ages 12 to 18 years old.

A year after the Netherlands law was passed, Belgium followed suit by legalizing euthanasia. The Belgium law does not explicitly mention PAS because of cultural prohibitions against suicide; however, PAS is currently performed and considered an act of euthanasia in this country. The Belgium law is similar to Dutch practices in that it requires a patient's repeated, voluntary, and well-considered request for euthanasia and the presence of intractable suffering. A consultation with a second medical professional and the careful documentation and reporting of all practices are required as well. However, this law also includes more stringent criteria by explicitly requiring that the patient be 18 or older and suffer from an incurable medical condition. Thus, some similarities and differences exist in the way PAS and euthanasia are defined and practiced in Belgium and the Netherlands.

In contrast to the statutes in Belgium and the Netherlands, a unique legal situation exists in Switzerland, where the penal code implicitly authorizes assisted suicide (either by a physician or a lay person), provided that aid-in-dying is not motivated by a desire for personal gains. Although the Swiss penal code opens a possibility for the decriminalization of assisted suicide, it explicitly prohibits euthanasia as a form of murder.

Although international issues surrounding PAS are noteworthy, the legalization of PAS in the state of Oregon is of particular significance in the United States. In 1994, a state referendum supported the legalization of PAS in Oregon, when voters approved a measure to pass Oregon's Death With Dignity Act (DWDA). The DWDA was eventually enacted in 1997, making Oregon the first state to pass a law allowing PAS in the United States. Under this act, a competent, terminally ill, adult resident of Oregon may request a physician's assistance in dying provided that certain regulations are met.

A number of requirements are built into Oregon's DWDA as a safeguard against abuse. In order to make use of the statute, a patient must first make two verbal and one written request for aid-in-dying, separated by at least 15 days. Next, the patient's terminal diagnosis and decision-making capacity need to be confirmed by the attending physician and a consulting colleague, with a referral to a psychologist or psychiatrist in cases where the patient's judgment may be impaired because of a mental health condition. Finally, the patient has to be informed of alternative end-of-life options, and the prescribing physician must suggest (but not require) that the patient inform significant others of his or her end-of-life decisions. Provided that these requirements are met, the attending physician may prescribe a lethal dose of medication, after which a report is filed with the Department of Human Services. Such regulations are designed specifically to protect patients' rights while respecting their personal dignity and autonomy.

The legalization of PAS in Oregon, the Netherlands, Switzerland, and Belgium has spurred a vibrant line of research examining the incidence and characteristics of end-of-life practices in these countries. The reporting practices in the Netherlands and Oregon, in particular, have generated an expanding body of data regarding incidence rates, demographic characteristics, and reasons for patients' requests for PAS. Available data suggest that only a small percentage of patients make use of PAS. Specifically, in 2005, 0.1% of deaths in the Netherlands and 0.12% of deaths in Oregon were the result of PAS. The most common reasons for requesting PAS in Oregon included concerns related to the loss of autonomy, dignity, or personal control, whereas fear of uncontrollable physical pain was a less important factor in patients' desire for assisted suicide. Such research findings enhance the humanistic perspective of this social issue.

In conclusion, assisted suicide and PAS have increasingly become a center of scholarly and public discussion. Informed participation in the assisted suicide debate requires knowledge of terminology and familiarity with the arguments regarding the legalization of this practice. Legalization has become an important aspect of the assisted suicide debate, and a number of countries (i.e., the Netherlands, Belgium, Switzerland, and the U.S. state of Oregon) have implemented statutes that permit PAS under certain conditions. One important outcome of the legal status of PAS in these countries is the proliferation of research on the practice of assisted suicide with the potential of furthering current understanding of end-of-life issues.

Atheism and Death

Atheism is the disbelief in the existence of a deity. Although atheism is often associated with agnosticism, it has its own distinct meaning. Whereas agnostics believe that it cannot be known whether there is a god, atheists explicitly reject the existence of such a being. This rejection especially manifests itself in periods of secularization in which the immanent world becomes evermore important at the expense of the metaphysical constellation of god, world, and soul. This does not mean that representations of a transcendent world, such as god, heaven, and afterlife, no longer exist—it means that people in a secularized society may reject these notions as part of their lived reality. Because many people live in a secularized society, atheism is relevant for understanding death from a nonreligious point of view.

Atheism itself gives no meaning to death—it only rejects transcendent interpretations of death. From an atheistic perspective, meaning of death results just from an immanent analysis based upon the profane and worldly interpretation of reality. As a consequence, atheistic meanings of death are defined both by immanent meaning and by the disbelief in a deity. Although immanent meanings of death can go together with a personal belief in god, this is not the case in atheism. In the following, immanent meanings of death are explored by first sketching the main sources for immanent meaning. From there, three immanent meanings of death are presented and future immanent meanings of death are briefly explored.

Immanent Meanings of Death

The main sources for immanent meanings of death are nature and the human being. Nature-centered meanings have roots in the ancient thought of materialism—the doctrine that reality has objective existence that consists of material

particles—and have been further developed in the movement of naturalism from the early Renaissance onward. Generally speaking, these immanent meanings represent the idea that nature provides a strict physical understanding of reality, including the reality of death. Human-centered meanings have roots in the ancient thought of immanent idealism—the doctrine that human ideas make up the reality as we know it—and have been further developed in the Renaissance movement of humanism. Generally speaking, these immanent meanings put humankind and its capacity to give meaning to reality in the center of the universe.

The lines of thought from materialism to naturalism and from immanent idealism to humanism present different meanings of death. Natural-centered meanings of death tend to reduce persons to their complex material bodies. In such a perspective, death does not mean the end of one's existence—persons continue to exist as corpses for a while after they die, whereupon the body recycles into other forms of nature through physical decay. Although this gives meaning to a bodily death, it does not do so for death as a psychological annihilation. Human-centered meanings of death, on the other hand, tend to reduce living persons to their potential for self-realization. For example, many humanists believe that people continue to exist in the contribution they made to create a better world. As such, individual pleasures, ideas, and achievements may transcend death. Although this perspective provides meaning, it regards life rather than death. As a consequence, both nature- and human-centered meanings of death remain limited in their analysis. However, there are exceptions to this limitation. Three of them will be explored in the next sections.

Epicurean Perspective

A first thoroughly elaborated immanent meaning of death is presented by Epicurus (341–270 B.C.E.). Although Epicurus believes in the gods, he sees them as entirely unconcerned about human beings. Epicurus's analysis on death is built on a strict materialism in which the human being has no metaphysical or transcendent meaning. He believes that objects exist only when they can be perceived or imagined as material objects. As a consequence, reality is exactly as it appears to our senses, assuming that our senses function accurately. Everything not material is simply the absence of reality and thus nonexistent.

According to Epicurus, there is no need to fear death. Moreover, he argues that death is not a misfortune for the one who dies. He presents an impressive proof for the irrationality of the misfortune of death. He claims that all good and bad consists in sense-experience. Because death is the privation of sense-experience, it does not exist. As a consequence, death, the most terrifying thing, cannot affect the living. We will never meet death, for when we live, death is not present, and when death is present, we do not live. Because we can never perceive death, death is of no concern to us and there is no reason to fear it—death means nothing to us.

The Epicurean perspective on death may not satisfy those who experience the shock of having to die. However, the therapeutic purpose of Epicurus's argument should not be underestimated. For Epicurus, knowledge is not an end in itself but a remedy for mental disquietude. Through meditating upon his line of argument, one's fear for death may be transformed into equanimity. The strength of this argument depends entirely upon the premise that all knowledge lies in sensation. When death cannot be perceived, its impact upon our emotional life must be illusionary. Thus, by excluding metaphysics, Epicurus nullifies death. Hence, a first immanent meaning of death is the exclusion of death from our experiential world.

Heidegger's Position

A second thoroughly elaborated immanent meaning of death is presented by Heidegger (1889–1976). Heidegger's position is neither theistic nor atheistic. He breaks with metaphysics, which for him is the traditional way of thinking in which the question of being is ignored. Instead, Heidegger wants to do justice to the immanent reality of being as such. He does so by exploring what it means for the human being to be. Metaphysics cannot provide the answer, for Heidegger rejects any metaphysical presupposition concerning the essence of humans. However, because life cannot generate its own meaning, it still has to relate to something outside of life. Heidegger finds this immanent outside in the finitude of one's own being.

According to Heidegger, understanding the structure of being is achieved through understanding the meaning of nonbeing, which, for the human being, is death. However, one cannot understand one's own death from experience, for death by definition lies outside of experience. As a consequence, death can only be understood as a future event, which is the possibility of one's own death: Death is the possibility of the absolute impossibility of being-there. Since this possibility is one's own most, nonrelational, and unrivalled possibility, it is distinctively impending. This means that one's being is structured by one's outlook on death—the human being is a being toward death.

By focusing on people as *finite* beings and on the *influence* death has on life, Heidegger overcomes the problems of both humanism, which focuses on human beings as potential beings, and naturalism, which places death outside of experience. Death can now be explored as a real phenomenon. It is the life-structuring event that guides all of our choices and projects. As such, it is the background against which life is configured. Only when people think of their relationship to death as manifest in each aspect of life can they be genuinely aware of what it means to live authentically—that is, to live as a human, and thus finite, being. Hence, a second immanent meaning of death is that it structures life within our experiential world.

Sartre's Philosophy

A third thoroughly elaborated immanent meaning of death is presented by Sartre (1905–1980). Sartre characterizes his philosophy as an atheistic humanism. He profoundly disagrees with Heidegger's analysis of death and claims that death cannot be considered an outside force that provides immanent meaning to life. Death cannot confer meaning, because meaning comes only from subjectivity. Any meaning of death is thus necessarily human. Death, as such, renders life useless and senseless for it deprives life of all meaning. Human problems remain unsolved and the meaning of these problems remains undetermined. As a consequence, awareness of finitude cannot provide an authentic mode of being.

According to Sartre, the meaninglessness of death prevents death from being a possibility. Instead, death is the end of all possibilities. This claim has important implications for the understanding of what it means to be a human being. When death is the nullification of all one's projects, it escapes one by principle. One cannot discover one's own death, nor wait for it, nor take an attitude toward it. Death reveals itself as indiscoverable for it disarms all expectations. As such, nothing can happen to death from the "inside," as it is completely closed and impenetrable. As a consequence, death does not belong to the ontological structure of the self. Instead, death is the victory of what lies outside the self—for the self, death is an absurdity.

The triumph of the outside over oneself, however, does not imply that one cannot freely give meaning to life. The absurdity of death shows us that one is not constrained by death. Moreover, death reveals our freedom. Although one is not free to die, one is a free mortal. Death thus reveals that one's freedom remains total and infinite. This revelation of infinite freedom suggests that the human condition can be transcended. That is to say, through one's infinite freedom one may overcome situations in which one experiences one's mortal status. Hence, a third immanent meaning of death is that it reveals an infinite freedom toward our experiential world.

Overcoming Death

Future elaborations of immanent meanings of death may result from developments in transhumanism. Transhumanism aims for the enhancement of all limitations of the human condition, including death. Most transhumanists are atheists with a materialistic perspective on life. They rely heavily on the promises of science and technology. For example, by understanding aging as a pure biological process on the level of molecules and cells, transhumanists suppose that insight in these processes may lead to enormous life extension. Aging can already be slowed down for small animals, and some scientists claim that the process of aging may be reversed in the future. Because from a transhumanist perspective death is to be postponed, and in the future even to be overcome, it is to be expected that these developments will have an effect upon the meaning of death.

The postponement and overcoming of death is less futuristic than it may seem. For example, in medical care the hope and belief in technology is

often the last resort for saving lives. When both patients and doctors are unable to come to terms with death, treatment may be pushed extremely far at the end of life. Transhumanism claims that if it becomes possible to overcome death, many people would opt for it. A first step toward immortality has already been made: With the help of cryonic preservation, cardiac dead people can "wait" for new technologies that may cure their life-threatening illnesses. This may lead to new immanent meanings of death in which the materialist doctrine of continued existence after death goes along with the humanistic promise of ultimate self-realization. This may be threatening for most religious perspectives on death; for atheists it just reflects the justified human aspiration to live and not to die.

Atrocities

An atrocity is morally wrong behavior that is so horrendous that it reveals a brazen disregard for the humanity of the victims. The aim of an atrocity is not just to harm the victims, but to desecrate them. Not every moral wrong, then, counts as an atrocity. The typical lie or act of shoplifting is hardly an atrocity. Not even murder need be about desecrating the victim. The list of atrocities that human beings have committed throughout history is disconcertingly long. During the 1990s, the killing of hundreds of thousands of Tutsis occurred in Rwanda, where leaflets and posters were distributed by Hutus characterizing Tutsis as snakes and cockroaches. Symbolically, snakes and cockroaches are rivaled only by rats as creatures that are viscerally the antithesis of what it is to be a human being. In Rwanda, it was blacks desecrating blacks. In the Asian world, Asians have desecrated Asians, as with China and Japan. In the Muslim world, Muslims have desecrated one another. Saddam Hussein, for instance, treated Shi'ite Muslims in a way that calls to mind the Nazi treatment of Jews.

The atrocities of the Nazi era represent the most sophisticated and sustained desecration of people to have taken place in the 20th century. And while it is clear that the extermination of the Jews was the central aim of the Nazi regime, it is equally clear that an ineliminable part of that aim was also to kill the Jews in a most dehumanizing manner. From transporting Jews to concentration camps in trains that had no restroom facilities of any form to making them dig their own graves to the brutal ways that they were used in so-called medical experiments, the aim was to peel away the Jews' sense of humanity.

Strikingly, atrocities are often committed by individuals who regard themselves as decent individuals. For instance, the lynching of blacks by whites in the United States in the Old South was typically committed by whites who considered themselves to be God-fearing Christians. The aim of lynching was not merely to punish blacks, but to revel in an utter disregard for the black body. During times of war, it commonly happens that male soldiers who think that rape is reprehensible nonetheless rape women who are identified as being on the side of the enemy. Needless to say, rape is one of the most profound ways in which a body can be desecrated, where the aim is not at all about killing the victim.

Evil Behavior and a Sense of Community

How can psychologically healthy people who take themselves to be decent individuals collectively do the unthinkable to others? Two important considerations present themselves. First, a defining feature of human beings is that they are capable of symbolic representation. A symbolic representation can be ephemeral and of little social significance as with the white glove that was once identified with Michael Jackson. Symbolic representation can also be imbued with enormous meaning and thereby occasion visceral feelings, as has been the case with two pieces of wood whose formation constitutes a religious symbol, namely the cross. People, too, admit of symbolic representation. Owing to upbringing, even psychologically healthy individuals may reach adulthood with a wealth of visceral feelings that are positive toward some individuals and negative toward others. Most of us rarely act on our negative feelings alone.

The second part of the explanation for atrocities is that when a group of people act hostilely in concert with one another, the sense of moral responsibility that members of the group have is, from a psychological point of view, quite diffused. Indeed, it is surely true that no single person is responsible or blameworthy for all that happens. For example, what exactly has one done if one was part of a crowd of individuals who blocked the escape of an innocent person who was subsequently hanged or tortured by those pursing that person? Moreover, not only does a crowd diffuse blame but it also provides individuals with a considerable measure of anonymity. Finally, in this vein, there is the fact that interpersonal comparisons are an ineluctable aspect of our self-assessment. Even if the way in which everyone is behaving is clearly wrong, the fact that everyone is so behaving is easily enough countenanced as an excuse for behaving in that manner. This is because the ubiquity of the wrongful behavior as evidenced suggests that only someone of unusual strength of character could be expected to refrain from the wrongful behavior in question; and while it is certainly nice that a person has such strength of character, no one can be expected to be that strong. In a word, one of the rationalizations for their own moral behavior, which many find most potent, is the simple reality that everyone is behaving in that manner.

Putting these two explanations together, atrocities can be explained as follows: When a group of people have been demonized, then the members of the demonized group have been symbolically represented as a profound danger to the physical and moral well-being of the group of individuals who consider they represent a higher moral order. Hitler, for example, claimed to be doing the work of the Lord in his attempt to exterminate Jews. Typically, the members of a demonized group are characterized as subhuman in some way or morally beyond the pale; accordingly, commonplace human sympathies toward members of the demonized group for the enormous pain inflicted upon such individuals are considered inappropriate, even a sign of weakness. When a group of people has been demonized, then it does not take much more than a social spark to occasion atrocities on the part of the members of the group who consider they represent a higher moral order. A social spark means something like the following: (a) one or more members of the demonized group have acted inappropriately toward a member of the group with the supposed higher calling when the members were, for instance, already weary of one another; or (b) the members of the group with the supposed higher calling question the fidelity of a particular member of their group. The slightest infraction on the part of a member of the demonized group thus presents an opportunity for one whose group loyalty has been questioned to publically affirm his or her disdain for the demonized group, while simultaneously affirming her or his identity with those who claim to have a higher calling.

Of course, atrocities can also be orchestrated. Those in Rwanda and Nazi Germany most certainly were orchestrated, and the systematic dehumanization of the victims was par for the course. What is equally true, however, is that atrocities can occur rather like spontaneous combustion. Lynching in the United States was much more like that than not.

One might think that individuals who have been members of a demonized group would never commit against others the kinds of wrongs that were committed against them. Unfortunately, this is not the case. People who have been demonized seem to be more than capable of demonizing others. The desire for revenge can blind people to their own ignominious behavior, as was the case in

Rwanda with the Hutus against the Tutsis. What is more, egregiously immoral behavior can be adopted as a means of control even by those who have been the primary target of such behavior. Joël Michel reports that lynching had become such a cultural practice in isolated areas of Louisiana that there were occasions when blacks would lynch a black, and there were 12 occasions when blacks joined with whites in lynching a black. Of course, these numbers are utterly insignificant when compared to the thousands of blacks lynched by whites only. However, these numbers underscore in a most poignant way that when it comes to atrocities, people can do the unthinkable. As Mark Rigg has shown, the same poignancy arises with people of Jewish descent willingly serving in Hitler's army.

Human Malleability

Philip Zimbardo's classic work, "A Study of Prisoners and Guards in a Simulated Prison," supports the line of argument presented in the preceding section. Student volunteers were variously assigned the role of guard or prisoner. The stunning surprise was that the "guards" began to take their role so seriously that they started mistreating the "prisoners" rather harshly—so much so that the experiment had to be stopped. Here we have an elite group of students who, beyond all shadow of a doubt, know that all are students who are equally innocent of any wrongdoing. Yet, the simple truth is that it was impossible for the so-called guards to take their role seriously without in some way demonizing the so-called prisoners, with the result being that otherwise decent and highly intelligent individuals willfully harmed individuals whom they knew from the outset were equally innocent and intelligent and from similar social backgrounds. The Zimbardo experiment points to the malleability of human beings. Even in a context that was publicly defined as mere role playing, among people who were equal in all the relevant social respects, the so-called guards began to think of themselves as having a higher moral calling. In turn, they viewed the so-called prisoners as morally inferior and proceeded to treat them quite harshly.

The malleability of human beings is both one of their greatest strengths and greatest weaknesses. Its strength lies in the ability of human beings to adapt ever so successfully to environments that differ radically from what they have previously experienced all of their lives—to achieve what had heretofore seemed impossible, as when Erik Weihenmayer, a blind person, climbed Mt. Everest. The liability is that these same creative powers make it possible for human beings to accord great significance to otherwise inconsequential differences, as Zimbardo's prison experiment astonishingly revealed. Evolutionary biology makes it unmistakably clear that phenotypical differences between human beings that allow for group classifications are utterly inconsequential, in that differences in moral and intellectual powers cannot be attributed to these phenotypical differences. Yet, with ingenuity and uncanny persistence human beings continue to accord great significance to these differences. Even in the 3rd millennium, what is known as scientific racism and the concomitant claim of racial superiority continue to have a serious foothold in human thought. One might ask whether we should take the ubiquity of racism on the part of human beings, with all that this entails in terms of humanity being susceptible to committing atrocities, as an indication of the equality of human beings.

Human Psychology: Justice Versus Evil

In *Republic,* Plato claims that the truly just are those who would live justly though the entire world treated them unjustly. Unfortunately, this is an ideal that would seem to be at odds with our psychological and social reality. This is because psychologically healthy human beings are quintessential social creatures, and this reality plays itself out in fundamental respects. First of all, social approval plays a fundamental role in how we conceive of ourselves. From physical appearances to intellectual prowess, the sense of self is inextricably tied to the assessments that others make of us.

What is more, there is unavoidable truth that there is much that is meaningful in life that cannot be done without the support of a community. The paradigm examples in this regard are friendship and love. Nearly everyone agrees that life without at least one of these is lacking in richness. However, there are many other communal activities that add to the meaning and richness of life, such as team sports or card games or group singing.

In the vast majority of instances, then, being part of a group is far too central to leading a psychologically healthy and flourishing life as a human being for Plato's idea of a just person to have an unshakable hold upon human lives. To recognize this much is to have deep insight into how it can be that psychologically healthy human beings commit atrocities. Contrary to what Plato thought, in order to be the kind of person who would choose justice over fitting in with those who have been a deep source of affirmation, it takes a strength of character (which most people do not have) and a willingness (which most people do not have) to make enormous sacrifices. And while we rightly admire saints and heroes, it is equally clear that we do not think that anyone can be morally required so to behave on behalf of others (with perhaps the case of immediate family members aside).

Fitting in with others is a form of self-preservation. Atrocities, then, tap into the most basic and fundamental of human instincts, namely self-preservation. This is because being a part of an affirming group is also one of the most basic forms of self-preservation. This follows from the fact that human beings are quintessentially social creatures. There is no need to deny that the difference between human beings and other social animals, such as dolphins and chimpanzees, is but a matter of degree. We need only note that small differences in degree can make a monumental difference in kind. The addition of language makes a profound difference. This is because atrocities are tied not just to feelings of hostility but also to the capacity of human beings to give articulation to those feelings and thus to proffer a symbolic representation of those feelings for other members of the community to embrace, avow, and thus for human beings to use as a ceremonious way of affirming their unity while simultaneously reinforcing their conception of the other as unfit. What is more, the corollary to the capacity for the spoken word is the capacity for the written word, which transforms the dissemination of ideas. Owing to these differences between animals and human beings, we do not regard animals as being capable of committing atrocities or, in any case, as capable of being morally responsible for their behavior. So it is even when, for example, we deem it appropriate to kill an animal for having mauled a human being to death.

Perhaps Plato may have the last word after all. He held that individuals could not be truly just unless, from the outset of their lives, they were entirely raised in just the right way. In the same way that defective buildings cannot be expected to survive major storms, people whose character formation is flawed cannot be expected to survive major moral storms. If this is right, then the explanation for why atrocities have been a painfully enduring part of human history is not so much that human beings have not had noble ideals. Rather, it is that in most societies it is profoundly rare that children have been raised with the kind of moral foundations that make it possible for them, once they reach adulthood, to weather major moral crises. In the absence of such a foundation, psychologically healthy people can do the unthinkable, namely be utterly indifferent to the humanity of another. In a word, Plato would say that atrocities exploit the fundamental moral imperfections of our upbringing.

Australian Aboriginal Beliefs and Traditions

The interest in Australian Aboriginal beliefs and traditions increased in the late 19th and early 20th centuries as European scholars tried to understand the origin and evolution not only of the human species but also of its religion and culture. Australian Aborigines were believed to be in the early stages of this development, representing the dawn of humankind, according to the models of cultural evolution at the time. In remote Australia, so-called wild Aborigines, almost untouched by European civilization, would thus enable scholars to gain a better understanding of how their forebears must have lived tens of thousands of years ago. The term *Aborigines* denotes this understanding of a people from the origin (*ab origine*), exemplary for the beginnings or early manifestations of social institutions and cultural forms.

Australian Aborigines were of great importance for social theorizing: Émile Durkheim's work on the elementary forms of religion and Sigmund Freud's idea of the primordial band, for example, were based on contemporary knowledge about indigenous Australians. To this body of literature the books published from 1899 onward by Baldwin Spencer and Frank Gillen made a major contribution. Because Gillen, a postmaster, had become acquainted with Aborigines in Central Australia, he and Spencer, a Melbourne professor, managed to document their traditions and beliefs in great detail. Spencer and Gillen did so on the basis of first-hand information and even direct observation of a totemic ceremony that would become crucial evidence for Durkheim's theory on social cohesion. Bronislaw Malinowski also grappled with Australian materials on the Aboriginal family. And Alfred Radcliffe-Brown documented and analyzed the intricacies of Aboriginal social organization and the variety of systems of kinship in Australia.

Across Australia an estimated 500 distinct indigenous languages were spoken. With also considerable variation in their habitat, Aboriginal groups differed in lifestyle and cultural practices enough for the continent to encompass many indigenous cultures. Although the perspective is complicated because a great many Aborigines are multilingual, almost all Aborigines share adherence to the general outline of a cosmology.

The Dreaming

The central concept in understanding Aboriginal cosmology is the Dreaming, the mythological, formative era during which the enduring shape of the earth was created, patterns of living were established, and laws for human behavior were set down. Spencer and Gillen introduced the term "the Dream time" for the Aboriginal cosmology. It was their translation of the word *alcheringa* from the Aranda (now: Arrente) in Central Australia. Although this translation is somewhat misleading, Aborigines have adopted it in speaking in English about their worldview. Most commonly used by Aborigines today are the terms *The Dreaming* and *Dreaming*. Another expression that has currency is *The Law*.

Dreamtime, the Dreaming, and related terms refer to the creation time. According to Aboriginal creation stories, Ancestral Beings reshaped the world in a long distant past. Thus, in contrast to the creation myths of world religions, this was not a creation out of nothing. The world already existed as an inert, amorphous mass of clay or, covered by water, in fluid condition. The powers of the Dreaming emerged from this mass, came to the surface, took human-like shapes, and wandered over the earth. In the process they had adventures, recounted in the creation stories, that were events that molded the landscape, and created nature and culture. Ancestral Beings transformed into animals and other creatures, vegetation, natural features such as rocks and creeks and waterholes, natural forces such as thunder and rain, and visible elements and formations in the sky. The Ancestral Beings gave Aborigines a blueprint for their way of life. According to the

creation stories, the Ancestral Beings also installed the major religious ceremonies.

Some of the narrated events of the Dreaming are reenacted in those ceremonies. Although the Dreaming refers to the long distant past of the creation time, for Aborigines the Dreaming is omnipresent in space and time—past, present, and future. Generally speaking, Aborigines attribute all acts of creativity to the Ancestral Beings of the Dreaming. So, in principle, there is no difference between patterns or designs found in nature and those made by Aborigines in the context of their ceremonial life. Both kinds of design may be conceived of as traces of the Dreaming, containing spiritual power. Their world is one of meaningful signs, and every sign is a statement of their being in the world.

The Dreaming thus continues to have relevance for the present as well as for the future through the Ancestral Beings that were present and active at the beginning of life and continue to exist and exert their influence. They are incorporated into the social system of clans and kinship, and their interrelationships resemble those between social groupings. Following Kenneth Maddock, a distinction between these Ancestral Beings can be made between so-called transcendental and totemic powers. The difference between both types of power corresponds to differences in the magnitude of their creative acts. Furthermore, the former transcends the specific social divisions connected to clans or particular kinship relations. The latter are associated with certain social groups, such as clans, to the exclusion of others.

Mythological Beliefs

Throughout Australia, a great diversity in mythological beliefs can be discerned. An example may be seen in geographical differences in the perception of transcendental powers. In the southern and eastern parts of Australia, an "All-Father" figure is said to have had decisive influence in shaping the earth, whereas in northern Australia, such formative power is ascribed to an "All-Mother" figure. Respective examples are Ngurunderi from the Lower River Murray area and Murtankala from Bathurst and Melville Islands. The majority of religious myths describe the wanderings and activities of various creative beings. However, in view of the great variation in the natural environment, it is not unsurprising that there exists an equal variety in explanatory myths. Moreover, even within clans and kinship groups, no single version is necessarily accepted as the only correct one. Frequently, the ancestral connections referred to reflect the protagonists' representations of social relations and subsequent relations to the land. Ideologically, Aborigines state they belong to the land rather than that the land belongs to them. Claims to the relevant ancestral connections have to be rooted in the authority of the Dreamtime, a privilege of the initiated, but it is still more of an achievement than a given since new aspects of Dreamtime stories, supposed to have always been there, can be revealed in a dream, a vision, or a newly made design. Whether such revelations, embodying the hidden dynamics of the Dreamtime, catch on and find acceptance or not often depends on the political state of affairs. Interestingly, introduced species, Jesus, cars, and planes, among other things, have been appropriated and incorporated in Aboriginal totemic systems.

How Death Came Into the World

The moon figures prominently in various Australian Aboriginal myths about the origin of death. In these myths, an ancestral being dies and another being, the moon, offers to revive the first dead ever. The offer is refused. Hence, death has come to the world. The myth of the cultural hero Purukupali and his brother Tapara from Bathurst and Melville Islands, northern Australia, is a case in point.

Toward the end of the creation period Purukupali introduced death into Tiwi society. Purukupali fought with his younger maternal brother, Tapara, after the latter had seduced Purukupali's wife and her son had died as a result of neglect. Tapara offered to bring the child back to life, but Purukupali refused the offer and said that because his son had died, all people had to die. In his fight, Tapara injured Purukupali's leg with a forked throwing club. Tapara was hurt above the eye and transformed into the moon. Every month the scar left by the injury above the eye still can be seen on the moon. In one version of the myth, Purukupali's baby, Djinani, dies of starvation; in another, he

dies of thirst due to having been left in the hot sun, while Tapara and Purukupali's wife Bima were having sex in the bushes. Bima was grief-stricken: Her wailing sounds can still be heard, because she turned into Waijai, the curlew. Whereas Tapara might be seen as a symbol of regeneration—think of the waning and waxing of the moon—through his promise to bring Purukupali's dead son (Djinani) back to life within 3 days, Purukupali issued death: as his son had died, he said, all people would have to die. Such myths involving death and the moon, with the refusal of a regeneration to life as their theme, have been recorded across Australia.

Mortuary Rites and Death-Related Taboos

Belief is transformed into action through Aboriginal ritual. Ritual and Dreaming mythology are closely intertwined. Previously, many authors have noted a strict gender division in religious ritual activities, suggesting that male rites were sacred and secret, whereas female rites were profane. This perception is no longer endorsed, for women do play an important part in male rituals; they also have rituals of their own. In addition, much of the sacred ritual and symbolic imagery is of equal significance to men and women, particularly in life cycle rituals, a frame through which to perceive the world.

Nearly everywhere throughout Aboriginal Australia mortuary rites are carried out, and in some places, these rites are elaborate and extensive. Aborigines had no conception of a natural death, but if this belief was once universal, it is no longer adhered to in most cases. Expressions of anger and utterance of physical threats, however, are part and parcel of the ritual repertoire and mourning behavior in a number of places. Suspicions of homicide, including deaths as a result of sorcery, can be dealt with in an inquest, sometimes followed with either the victims' vengeance by physical or metaphysical means or compensation by the perpetrators. Wailing is often accompanied by gestures suggestive of the self-infliction of harm, which have to be stopped by others on the scene.

Customary, the personal name of the deceased becomes taboo for a period of time. The same accounts for recorded voices and images. Other mortuary taboos Aborigines might have to observe relate to food, sexuality, the corpse, personal belongings of the deceased, and places frequented by the dead. Cleansing rites with smoke, water, or both, can release them from these taboos. Sometimes mock fights also occur to this end.

The cycle of mortuary rites often has particular ancestral connections, relating to the deceased and participants, as its theme. They entail a division of labor and the acting out of various roles, commemorating the dead in song, dance, ritual calls, and gestures, as well as restoring the social fabric. Painted designs and sculptures can also figure prominently. Besides bringing forth the transition of the deceased from the world of the living to the world of the dead, the rituals are interwoven with other passages, such as the initiation of youths, whereas initiation and seasonal rites may involve aspects of the mortuary cycle. Rather than having clear-cut beginnings and ends, mortuary rites tend to be part of an ongoing social discourse, expressed in the lyrics of mourning songs.

Forms of Disposal

The various types of mortuary ritual in Aboriginal Australia, including the treatment and disposal of the dead body, reflect the Aboriginal view of death as a transition through which a person moves to another phase of existence. An important concern of mortuary ritual is to drive away the spirit of the deceased from the world of the living to the world of the dead. This may include partial or complete destruction of the deceased's remains and the deceased's material possessions.

There exists a great variety in the ways of disposing of the corpse, including in the intensity and duration of the process. These forms include interment and/or reburial, exposure on a platform or tree, desiccation or mummification, cremation, placing in a hollow tree, and in addition, the exceptional ritual consumption of a tiny bit of the corpse has also been reported. The modes of disposal are not mutually exclusive, and in some places several forms may occur successively. The type and duration of a disposal may depend on the social status of the deceased, the nature of death, and the desires, political aspirations, and organizational power of the survivors. The places where the spirits of the dead dwell continue to be of significance. For example, the living call out to the spirits to assist them in hunting and gathering, the location of the graves has a bearing on territorial

rights, and touching the sand of a grave of a relative is supposed to bring luck in playing cards.

Autoerotic Asphyxia

Autoerotic asphyxia (AEA) is the practice of preventing oxygen uptake to arouse sexual desire. Medical professionals are likely to refer to AEA as the inducement of cerebral anoxia—a lack of oxygen in the brain—while attempting to achieve orgasm. Other names include asphyxiophilia, hypoxyphilia, and sexual asphyxia, which focus on sexual desire and would include arousing the sexual desire of one's sexual partner(s) in the act, whereas AEA is limited to practices that are directed to one individual for the satisfaction of his or her own sexual desire. It seems to have caught the attention of the scientific community in the early 20th century when a description appeared in the 1902 volume of the *Annales d'Hygiène publique et de Médecine légale*. As a regular supply of oxygen is necessary for survival, AEA risks causing death and it is largely through such deaths that AEA is known. While AEA seems to attract morbid fascination for its combination of sexual pleasure and the taking of one's life in a single act, that it is known through death is important for considering the epistemology of AEA. Furthermore, death is often represented in the act of AEA, such as with photos or videos of apparently dead people, which means that as AEA is known through death, death is also known through AEA.

Descriptive Knowledge

People who practice AEA rarely discuss this publicly, but because it is a cause of mortality, it has required that those involved in investigating these deaths, particularly the police, coroners, and forensic pathologists, must describe and interpret scenes of fatality where AEA seems to have occurred. The minimum requirements for suggesting that AEA was being practiced are the presence of signs of masturbation and asphyxiation. While asphyxiation is likely to be the cause of death in most autoerotic fatalities, it is possible that signs of masturbation are either absent or missed and therefore that AEA is overlooked. John Quinn and Pauline Twomey report of a man, Mr. J. B., in a psychiatric unit in Ireland who, while appearing to present no suicide risk, had been found with clothing tied around his neck on seven separate occasions. The staff thought these were parasuicidal acts until Mr. J. B. revealed that he found that the asphyxiation enhanced his sexual desire while masturbating. Consequently, AEA may be overlooked for parasuicide or suicide, particularly in psychiatric settings and scenes of fatality.

Methods of asphyxiation include applying pressure to the neck; using ligatures for strangulation; fixing airtight materials, particularly plastic bags, around the head; and using chemicals, such as anesthetic gases and solvents, that remove oxygen. Inducing cerebral anoxia can be relatively simple, but elaborate devices can be constructed with

systems that are intended to halt the asphyxiation before it harms the individual involved.

Although AEA is understood to help excite sexual desire, scenes of autoerotic fatality often contain items that are not necessary for asphyxiation or masturbation but may be involved in the practice. Items include pornography; materials such as plastic and fur, which are used in fetishist practice; devices for stimulating the anus; photographs and movies apparently depicting scenes of death; and mirrors and video cameras that are in a position that would allow the individual concerned to watch him- or herself during AEA. Two elements that become more common as the age of the person involved increases are the presence of physical restraints (in addition to any ligatures for asphyxia) and wearing clothes indicative of the opposite sex, which are termed bondage and tranvestism, respectively. Like AEA, bondage and, in some cases, tranvestism are practices for attaining sexual gratification and such practices can be combined.

Forensic evidence describing AEA has accumulated since the first report in 1902, but there are many other sources that predate scientific interest in AEA. The most infamous literary examples are likely to be from the work of the French aristocrat Marquis de Sade (1790–1840), who was imprisoned for his violent and pornographic writing. An example that is most often used in reference to AEA comes from legal documents from a trail of the murder of František Kočzwara, composer of "The Battle of Prague." Kočzwara was from Prague but spent much of his time in England where he died February 2, 1791, in the company of Susannah Hill, a prostitute he visited in Vime Street, Westminster. Hill was tried for, and acquitted of, murder and reported that Kočzwara fastened one end of a rope to the doorknob and the other around his neck and asked her to let him hang for five minutes, which led to his demise.

A more contemporary example comes from Australia where Michael Hutchence, a member of the band INXS, was found dead in a hotel room in 1997 with a belt that had apparently been used for asphyxiation. The coroners ruled that Hutchence's death was suicide, but in the absence of a suicide note and the naked state in which Hutchence was found, others, particularly close family, have suggested that he died in the practice of AEA.

Epidemiological Knowledge

Estimates suggest that one in a million people practices AEA, but it is extremely difficult to provide accurate figures on the prevalence of AEA. Despite the variety of ways of expressing sexuality across cultures, much sexual activity remains concealed, and this is particularly so for AEA. Even if practitioners were happy to discuss their AEA with others, it is unlikely that they would feel compelled to seek medical help for something that enhances sexual pleasure. One of the most detailed descriptions of AEA in the living is the biography of Nelson Cooper by John Money, Gordon Wainwright, and David Hingsburger; unfortunately, this is only about one person and tells us little about people who practice AEA. Consequently, most of the epidemiological knowledge is from practitioners who die as a consequence of AEA.

There is much agreement that many autoerotic fatalities occur in men under 30 years old, but estimates of the total number vary dramatically. For example, for the United States and Canada figures range between 40 and 2,000 deaths for all age groups every year and it is difficult to decide which figures are most accurate. Many countries keep an annual record of mortality and its causes, but these records rarely contain reports of autoerotic fatalities. Mortality figures do report deaths due to asphyxiation and may even separate these deaths into accidental asphyxiation and suicide, but neither is limited to AEA. Family and friends may remove signs of sexual activity to avoid embarrassment, which could leave the scene looking like suicide. In addition, scenes of death require careful examination and may provide few clues that are easily interpreted.

Friends and family may help investigators build a picture of the deceased and explain the importance of clues found at the scene, but they may be unlikely to help with information of a sexual nature. More specifically, those involved in making reports of death are likely to give some consideration for the family and friends of the deceased and may be wary of raising the prospect that the activity causing death was sexual. However, some analysts of adolescent suicides suggest that almost 1 in 20 suicides and 1 in 3 hangings are related to autoerotic deaths.

Epistemic Considerations

Understanding of the epidemiology of AEA has been built upon analyses of instances of death and its causes. Consequently, knowledge of AEA has largely emerged through the death of practitioners of AEA, and it would seem prudent to attend to the importance of this for the epistemology of AEA. Crucially, there seem to be two, albeit entangled, epistemic considerations: the representation of death in (a) the practice and (b) the study of AEA.

First, death is often represented in the practice of AEA. Practitioners have been found with pictures, photographs, and films depicting people who appear to be dead or dying. In addition, practitioners have been found with devices that allow them to see themselves or parts of themselves in the act of AEA. As AEA is the practice of restricting air supply to arouse sexual desire, the distinctive element would appear to be the physiological response, the dizziness and euphoria that occur as a result of oxygen deprivation. The representation of death is not necessary for such a response to occur. Consequently, because depictions of death are not necessary for asphyxiation, it is probable that they have a more direct role in sexual excitation. Indeed, death from asphyxiation may be more than an unintended consequence as the risk of death or an experience of a greater proximity to death may be implicated in the stimulation of sexual arousal. The point is that representations of death may be part of the practice of AEA that is sexually exciting.

Second, death is represented in the study of AEA. As part of the collection of evidence, investigators take photographs and videos of death scenes. In addition, investigators draw pictures depicting the scenes or aspects of it and may even put together a mock-up of the original scene. In the study of AEA, researchers draw upon pictures, photographs, and stories for illustrative purposes. It would not be uncommon for a journal article or talk about AEA to start with a short story of a mother who discovered her son in a state of undress, surrounded by pornographic materials and bound with a device for causing asphyxiation. Similarly, photographs and pictures depicting autoerotic fatalities may be used throughout an article or talk, and in books, such images may adorn the jacket cover. As the representation of death would seem to be an aspect of AEA, the use of such images (both narrative and pictorial) in the study of AEA is not inconsequential. Lisa Downing and Danny Nobus pose that the source of such images often remains ambiguous. That is, it is not clear if the image is a mock-up, if it is of a scene of an autoerotic fatality, or if it is from such a scene. A story may be of a real death or it may be fictional, a picture may be of a person who has really died as a consequence of asphyxiation or it may be an actor pretending, and a picture may be one the investigators took at the scene or it may be one that was found at the scene. The representations of death used in the study of AEA seem to have a similar epistemic status to those representations used in the practice of AEA. As such, the images constructed, however that may be, in the study of AEA may have the consequence—intended or not—of arousing sexual desire.

It is unlikely that the researchers and investigators will ever dispense with such images of death. What this highlights, however, is that the morbid interest with which AEA is often received is a fascination with representations of death that are in some way sexualized. During the last half of the 20th century there were on average 10 cases of AEA reported in the academic literature every year. As death and sexuality are of concern to so many and yet manifest in such a variety of means, this interest with AEA is likely to continue because it combines both.

Awareness of Death in Open and Closed Contexts

In 1965, Barney G. Glaser and Anselm L. Strauss's study of the different awareness contexts of dying was the result of an extensive field study of how dying and death were treated in a number of American hospitals in the early 1960s. The four different awareness contexts portrayed by this study were to lay the foundation for an awareness of dying and death that resulted in a new paradigm.

In the first, *closed awareness*, dying patients do not know of or recognize their impending death because this information is withheld from the patients. Five structural conditions contribute to closed awareness: (1) the patients' lacking the experience to recognize signs of death, (2) physicians' not informing the patient that death is imminent, (3) the lack of discussion of death among family members, (4) the medical organization's not providing adequate information to the patient, and (5) the patients' lacking allies who would reveal the truth.

The second awareness is *suspicion awareness*. The patient does not *know* he or she is dying, but *suspects* death is close and also suspects the professionals are withholding information that would confirm this suspicion. Several structural conditions are supposed to account for this suspicion: (a) bodily changes in the patient, (b) changes in or termination of treatment, (c) cues from professionals or next of kin, and (d) the patient's being alarmed by the name of the care unit (i.e., the intensive care unit or oncology department).

The third awareness context is *the ritual drama of mutual pretense*. That is, the patient, professionals, and the next of kin know that the patient is about to die but pretend they do not know and hence act as if this were not the case. The structural conditions of open awareness are present here, but one of the parties expresses a desire to pretend that death is not impending and the other party (or parties) decides to play along in this drama. Two rationales for agreeing to mutual pretense on behalf of the professionals are found: (1) the patient wishes to pretend, and (2) the patient is easier to handle if the matter of death and dying is not openly discussed.

When both patient and professionals know the patient is dying and acknowledge this, there is an open awareness, the fourth context. Here different degrees of openness are found to occur. This includes whether death is expected, when it is expected, and how it will come about.

Further Contexts of Awareness

This fourfold analysis does not fully entail the complexity of awareness contexts, and further research has found elaborated versions of awareness. If a person acquires knowledge about impending death, but this knowledge is effectively blocked out, this results in *suspended awareness*. If the dying person oscillates between periods of open and closed awareness, this results in *conditional awareness,* in which the oscillation is triggered by different external or internal factors. Awareness of dying in the conditional sense can also be contrasted with the awareness of being mortal, an awareness that it is sometimes claimed we should have throughout life, that is, the idea about *memento mori.*

Paradigm Shift

The study by Glaser and Strauss described a situation in which closed awareness and withholding information were the norm for relating to dying patients. At the same time it was emphasized that death and dying were surrounded by a taboo, hindering open discussion and information. Through the efforts of thanatologists and pioneers within the hospice movement of the 1960s, a shift in this paradigm around death and dying started toward a generally more open climate, including calls for open discussion of death and dying and the recognition of the care of dying patients as an essential part of health care. In studies conducted by Elisabeth Kübler-Ross, awareness of dying was a necessary feature of being able to reach the stage of acceptance now deemed essential to providing patients with a good death. In the works of Dame Cicely Saunders, the ability to provide proper care for the dying patient also required openness of the topic of death and dying; closed awareness was no

longer considered effective in contributing to a good death.

The norm supporting open awareness is supported by a shift in the structural conditions of health care and medicine, wherein emphasis on patient autonomy has resulted in an obligation to always provide the patient with adequate information concerning his or her condition, including information about death and dying. However, research shows that the obligation to adequately inform the patient is interpreted as conditional by professionals who, to a large extent, continue to retain control over the disclosure of information. The norm of open awareness is found to be well in line with a modern role of dying, emphasizing the individual person's possibility to fashion one's own death, a factor that requires awareness of approaching death.

Establishing open awareness as normative results also in a shift in expectations for how patients should relate to death and dying. Not only being aware of impending death but also being committed to talk openly about death is labeled *full open awareness*.

This shift in awareness has resulted in discussion and critique of the new paradigm. In other cultural contexts, closed awareness is seen as a way to protect the dying person from distress. It is also found that patients oscillate between open and closed awareness to avoid threats and to handle relationships and thus control the level of awareness in a way that is tolerable to them. Within the context of full open awareness, that which is now interpreted as denial of death has been found to be a lack of interest in discussing death and dying; patients are unwilling to be constantly reminded they are dying. Different studies appear to balance this conflicting view by pointing out that the modern role of dying is still not generally accepted or practiced and is dependent on factors such as culture, class background, and age. Moreover, it is generally associated with specific conditions that affect awareness around dying and death, such as deteriorating mental faculties.

Normative Issues Around Awareness

The normative requirement that the dying should be aware of impending death gives rise to the question of whether that person should have a choice of such awareness of oncoming death. Psychological studies of defense mechanisms suggest that dying persons can regulate their awareness of oncoming death at a tolerable level. Moreover, Glaser and Strauss demonstrated how professionals can regulate the patient's degree of awareness. This raises questions about whether they should support open rather than closed awareness or some other awareness alternative. Whether dying persons should be made aware of death and dying is mainly a matter of norms and values concerning what is beneficial to the dying person and whether the dying person has ethical obligations that should be fulfilled even in the face of death.

Questions pertaining to what is beneficial to the dying person give rise to three types of arguments. First, awareness is instrumentally useful in that it enables the dying person to take advantage of the remaining time left—to prepare for death in different ways, take evasive actions against death, or just focus on the things that will bring value to one's life in the time one has left. Second, awareness will be conducive to self-determination, freedom, and control over the dying person's life. Third, awareness is valuable in itself insofar as it is an essential part of a good life.

The instrumental value of awareness is dependent on the value of what is achieved, whether we can achieve this regardless of being aware and whether the price of awareness is worth the benefits achieved. However, a price is exacted for this awareness of oncoming death in the form of a lower well-being and a lack of motivation. In contrast to this type of argument, it has been suggested that it is possible to take evasive action without being fully aware of oncoming death. It has been argued that the preparations the dying person can do should be made earlier in order to safeguard their benefits, or perhaps these are not important enough to warrant attention. It has also been argued that insights into the limits of time might bring stress and paralysis, hindering the person from using the time left to achieve quality of life.

That awareness, conducive to self-determination, freedom, and control, is important to allow one to plan and realize these life plans. It is also related to the fact that such knowledge allows one the freedom to act within reason but without consequence, and in the face of death, that which may have caused fear now loses its hold. But it has also been

posed that relevant information leads to a loss of initiative.

Moreover, it has been argued that avoidance of the negative experience of awareness is not useful to the extent that one cannot use this knowledge to alter one's own life or that of others for the better.

That the dying person should recognize an ethical obligation to become aware of impending death is associated with the fact that this might be instrumental in benefiting or fulfilling obligations toward other people. If the dying person and next of kin adopt different awareness attitudes toward death and dying, this can result in the lack of open communication, such as not being able to engage in taking an appropriate good-bye. However, it has been emphasized that this is dependent on a certain expressivist view of relationships in which close relationships imply that we share intimate thoughts and feelings. It has also been argued that if the parties adopt a common attitude of closed awareness or denial, this might cause the relationship to continue more smoothly.

In conclusion, the shift in paradigm from a closed to an open awareness context surrounding death and dying has been supported by reference to values and norms relative to how a dying person should be treated medically and otherwise. However, research and discussion of open awareness provide equivocal support for such a paradigm, and in relation to the dying patient the matter of awareness calls for a continued discussion of what is beneficial to the patient and the next of kin.

Banshee

The banshee is the Irish supernatural death-messenger par excellence. Regarded as a family messenger of death, this female spirit is said to cry when a member of Irish family is about to die, at home or abroad. Belief in a female supernatural being foreboding death is an ancient cultural inheritance in Ireland. In the literature of early Ireland in the Irish language such beings appear in the context of imminent death, and the motif has persisted through the centuries in Irish poetry and prose.

A supernatural female foreboder of death has also appeared in works in the English language in Ireland for a couple of centuries. In *Castle Rackrent* published in 1800, Maria Edgeworth notes that in the previous century the great Irish families had a Banshee, but their presence was no longer evident. In representing the banshee as an element of past belief on the part of the Anglo-Irish aristocracy, Edgeworth makes no mention of the persistence of belief in such a being among the people at large in her time—something which she was likely to have been aware of in view of her knowledge of the beliefs and customs of the peasantry.

Other writers also make mention of the banshee in the course of the 19th century, but their accounts are general in nature and often strive to provide an antiquarian-type interpretation of the belief. Few of these analysts acknowledged that rich and varied oral traditions of the banshee were current at the time of writing, in both English and Irish languages, which would have added substance to their accounts and provided a clear picture of the complex nature of the belief. Thanks to the efforts of the Irish Folklore Commission and its successor institutions, a large body of such traditions was amassed in the course of the 20th century, and field work continues to complement and corroborate them in the 21st century. It is thus possible to explore the richness of ideas about the banshee prevalent in the oral traditions of the Irish people in the 19th and 20th centuries, and to assess the role that these traditions played in the lives of those who held the belief. Such a substantial and varied body of source material also enables researchers to determine the main components of the banshee belief in Ireland in recent centuries, to assess regional variation in the traditions concerning her, and to explore her manifestations and roles in earlier centuries.

The names attached to supernatural beings are usually important indicators of the main traits associated with them in the oral traditions of the people. The names can also point to regional variation in traditions about such supernatural beings, and they can be of assistance in trying to determine the age, origin, and functions of the belief concerning them.

Irish Tradition and the Banshee

The Irish supernatural death-messenger is known by a variety of names in different parts of the country. The most common term, found throughout Ireland, is *bean sí* (anglicized "banshee"), meaning "woman of the otherworld," clearly

indicating that she is considered to be of female gender and of supernatural origin. In view of the wide distribution of this appellation for the supernatural death-messenger and because it is found in areas where other local terms are prominent, it can be assumed that it has been the most common and most widespread name for this supernatural being for many centuries.

In parts of southeastern Ireland the banshee is also known by various dialect forms of the word *badhbh,* the name of a goddess, usually a goddess of war, appearing in medieval Irish literature, while in the South Midlands she is called *badhb chaointe* "keening or lamenting *badhb,*" an appellation reflecting her origin and role behavior. The distribution pattern and various dialect forms of the word *badhbh* indicate that these terms are of appreciable use in the areas where they have been recorded.

The remaining traditional name for the banshee is *bean chaointe,* "keening woman," a term that is heard in parts of counties Tipperary, Limerick, and Mayo and may once have been more widespread. This name refers specifically to supernatural being's role behavior—lamenting—and may have been influenced by a similar designation for a human woman who lamented the dead. It may also have given rise to the idea found occasionally in the oral tradition that the banshee was, in origin, a former human keening woman who was obliged to continue keening after death because of some misdemeanor in this life. This explanation is not very prominent, however, and despite the appellation *bean sí*/banshee, neither is the idea that she is one of the fairy folk. Tradition-bearers clearly distinguished between the banshee, who is depicted as a solitary being and a messenger of death for certain families, and the fairies, who are regarded as social beings with a range of activities and relationships that does not include the foreboding of death, and they are also not particularly attached to families, or indeed, human beings in general.

Actually the question of the origin of the banshee has only occasionally been raised by tradition-bearers. Yet, the idea that she is connected in a special way to particular families—as an ancestral figure—is a central aspect of the traditions concerning her.

The banshee is said to follow certain families; that is, her connection with them extends from generation to generation. These were particular noble Irish families, and she was said to follow their chieftains or heads. She is also connected to land, patrimony, and identity, thus echoing the poetic evocation of the s*í-bhean* or *bean sí* with noble Gaelic, or Hiberno-Norman families in the 17th century when confiscations and plantations by the English government led to fundamental changes in land ownership in Ireland and in the ethnic, religious, and linguistic profile of much of the country in that century.

Thus traces of an ancestral female figure, with vestiges of the role of a patron goddess, would appear to be discernible in the oral traditions of the death-messenger. Such traces are, of course, older than the 17th century, and analogies can be suggested with other foreboding or lamenting female figures in medieval Irish literature who were concerned for the fortunes of specific noble families or individuals. In the 8th-century prose tale *Táin Bó Fraích*, the impending death of the hero Fraoch mac Idath is announced by the cries of otherworld women, while the goddess Mór Mumhan laments over the grave of her mystical spouse Cathal mac Fionghuine. In later texts his own death is foretold to Brian Ború, High King of Ireland, at the battle of Clontarf 1014, by Aoibheall of Craig Liath, patroness of the Dal gCais sept (clan), County Clare.

Other traits of the death-messenger of modern folk tradition also support this analogy with female sovereignty figures of medieval literature: her appearance both as an old woman and, to some extent also as a tall, vigorous, beautiful young woman, and her washing activity. The latter trait is found in the folklore of parts of western Ireland, particularly in 20th-century oral tradition of County Galway, where the death-messenger is portrayed as a washerwoman beetling clothes in a stream on the eve of the Battle of Aughrim 1691—an activity attributed to the war goddess *badhbh*, said to forebode violent death in battle by washing the blood-stained garments of those fated to die.

It is probable, therefore, that the death-messenger of modern folk tradition originated from the idea of a patron goddess with a variety of contrasting attributes and functions, including the foreboding and announcement of death. It is the former trait, that of death-foreboder, which is emphasized in the death-messenger tradition, and throughout

Ireland she is popularly said to perform that function by crying and lamenting.

The most outstanding characteristic of the banshee in her role as herald of death is her sound. This is usually described in the oral tradition as a female-type inarticulate cry full of sorrow and grief for the person about to die. The banshee is thus thought to be well disposed to the dying person, and her behavior is generally considered to be nonviolent and human-like. So strong was the belief in the death-messenger-as a foreboder of death, it was generally accepted that if a seriously ill person was "followed" by the banshee that he was fated to die once she had cried; in fact, some people held that such a person could not die until the manifestation of the supernatural death-messenger had occurred.

Contemporary View of the Banshee

The dominant popular image of the banshee is as a female figure who always appears alone. She is imagined to be a small old woman, dressed in a long white cloak, with long white hair, which she is almost invariably combing. This image of an old woman probably springs from her connection with death, her perceived ancestral connection with the family she follows, and her role as an outdoor or nature being. The combing motif, which has given rise to an oral legend about how the banshee lost and recovered her comb, also links the banshee with otherworld women similarly depicted in connection with death in medieval Irish literature.

The betwixt and between times—midnight, dawn, and dusk—are the times particularly associated with the manifestation of the death-messenger. These dark and gray hours are especially associated with supernatural beings connected with death, and they are also times when light and sound conditions favor supernatural interpretations of phenomena to which natural interpretations would be given if they occurred in the daytime. Thus, if someone were known to be seriously ill, the supernatural death-messenger would easily spring to mind if an unexplained plaintive cry was experienced at these times.

Most manifestations of the banshee are said to occur in Ireland, usually near the home of the dying person. The cry might also be located near unusual nature formations, like hills or rocky eminences, which appear to have stirred people's imagination and would have been prominent landmarks in the locality.

The death-messenger is often heard near water, such as at wells, lakes, and rivers. The latter formations were also often prominent landmarks in localities or formed boundaries between farms, parishes, or even counties. Because sound travels along water, once it has been associated with the death-messenger it is easy to imagine that the supernatural being who was imagined to emit the sound was also located near to water.

The banshee usually appears in Ireland, but some accounts also refer to the announcement in Ireland of the deaths of Irish people overseas, thus acknowledging deep family roots in the old country. This is especially the case in relation to death in the United States, a country to which Irish people emigrated in large numbers in the 19th and 20th centuries.

It is those concerned with a death, at family and community levels, who usually hear the banshee, rather than the dying person. This is in accordance with the general belief that the dying person does not experience the death-messenger. It also reflects prevailing attitudes toward death and dying in traditional Irish society, in which the care and attention of the dying person and the arrangement of the obsequies were the responsibility of the family and the community.

Despite the almost inevitable weakening impact of changing attitudes toward death in Ireland, on beliefs and customs traditionally associated with the final crisis in life, belief in the banshee as a foreboder of death in certain families seems to have retained a fairly tenacious hold on people's imagination. Such a deep-rooted and obviously significant belief is likely to remain part of the Irish cultural inheritance for ages yet to come.

Baptism for the Dead

A single verse in the Bible speaks of baptism for the dead: Chapter 15 verse 29 of Paul's First Letter to the Corinthians, itself the longest focused textual reflection on death in the New Testament. This entry explores this much ignored verse, the imagery of death in ordinary Christian baptism, and how vicarious baptism became foundational within Mormonism and fostered its program of genealogy.

Textual Conundrum

This Corinthians passage has often been included in funeral services because it highlights the centrality of resurrection within Christianity. Written to oppose arguments against resurrection, it links Jesus's resurrection with the future resurrection of believers, convinced that Christianity devoid of resurrection is vacuous. Just when concluding his depiction of a future when sin and death are conquered and God is supreme, he cites the practice of those who are "baptized for the dead," emphasizing that such a rite would be pointless without the ultimate resurrection of the dead. For Paul, that rite demonstrated belief in resurrection; otherwise, the practice would deny its underlying motivation. Whatever its original meaning, this text's existence within scripture allowed subsequent commentators either to ignore it as inappropriate to need, as has often been the case, or to breathe new life into it as occasion demands.

John Calvin (1509–1564), the Protestant reformer, was but one who pondered vicarious baptism, well aware that the early Church Fathers Ambrose (339–397) and Chrysostom (347–407) and others had assumed the text referred to the custom, albeit rather superstitious and corrupt, of baptizing a living person at the graveside of some unbaptized Christian who had suffered an unexpectedly sudden death prior to baptism. Calvin not only alludes to various interpretations but also tells how he changed his mind over this text. He could not believe that Paul would ever allude to something with which he personally disagreed simply to have an example to prove a point. Calvin's early view had been that the text was a general indication that baptism was an important aspect of the Christian life as far as eternity was concerned. All that baptism embraced would be realized in the afterlife world of the dead: In that sense baptism was "for the dead." But then Calvin changed his mind, accepting the text as referring to Christians who, while still learning about the faith as catechumens were not fully prepared for baptism, discovered that they were soon to die, perhaps of a terminal illness. Now, despairing of life, with baptism of no use to them in this world, they saw themselves as "dead people." In being baptized for the dead, they were being baptized as and for themselves as people as good as dead. This would be a comfort to them and an example to their healthier fellows on the value of baptism.

Baptism at Large

It is certainly true that baptism was profoundly important as a mark of full identity within early Christianity as within its subsequent history. Integral to its theological meaning has been an interplay of the ideas of life and death portrayed in the image of the resurrection. To be baptized was to be associated with the death and resurrection of

Jesus. The water of baptism was, among other things, like the grave. One entered it, "died," and emerged as though from the grave. While baptism mirrored what had already happened to Jesus, it foreshowed what would happen to believers at the future day of resurrection. Baptism was also a form of rebirth.

Other symbolic associations included the theological idea that human beings lived a life "in the flesh" and as sinful creatures until such time as they were revivified by the power of God's Holy Spirit so as to live "in the spirit." Paul invoked the motif of the first Adam who disobeyed God, died, and brought death upon all humankind while Christ, as the second Adam, was obedient to the point of his own death but, through his resurrection, now brought life through a future resurrection for humanity (Romans 5:12–21). These and other motifs of deliverance invested the act of baptism with powerful notions of salvation. So, when Paul spoke of some as being "baptized for the dead," he touched a vibrant topic. In much contemporary Christianity, however, whose rites have developed from traditional and long-established baptismal liturgies and include many allusions to death to sin, association with Christ, deliverance from slavery, and spiritual rebirth, the motif of "baptism for the dead" finds no place, except for one major case, that of Mormonism.

Latter-day Saints

Joseph Smith (1805–1844), founder of the movement that came to be called The Church of Jesus Christ of Latter-day Saints, popularly known as Mormonism, believed God had revealed to him the fact that living individuals could be baptized for the dead, in the sense of being baptized on their behalf. This vicarious baptism, in which a living person stands proxy for a deceased individual, became framed by a much wider theology of life, death, and afterlife and directly answered the question of the destiny of millions who died before hearing the Christian message or being able to respond to it.

From its inception in 1830 until Joseph's death in 1844, Mormonism was transformed from an essential Protestant Adventism, awaiting the imminent Second Coming of Christ and preparing a kingdom for his arrival in America, to a people possessing a growing interest in ritual performances conducted in sacred secrecy that endowed worthy members with a status guaranteeing them an identity as kings and gods in worlds they would inhabit after their death and resurrection. Joseph saw the universe as operating by well-defined principles, one of which ensured that revealed rituals performed in designated sacred places under the conditions of "time" and earthly mortality would have a direct effect within the afterlife domains of eternity. These included baptism, ordination, and a form of sacred marriage and sealing together of partners for eternity; marriage was not only until death. One key ritual was that of Endowment. This taught basic truths of creation, the fall, and the redemptive atonement effected by Jesus within a wonderful Plan of Salvation devised before the earth was actually organized into its habitable form. Endowment was a form of death-conquest that gave to those who worthily maintained their covenantal vows taken out with God power to survive death and flourish in the eternal postmortem worlds of eternity. Both the principle of earth-based ritual that might secure a heavenly destiny and the recent origin of the church fostered a degree of urgency concerning those who had died before this church restored to the earth truths and rites that had been removed by God shortly after Christ's death and resurrection. Joseph's revelations covered these problems, as documented in *The Doctrine and Covenants* ([DC] 124:33), a book of divine directives that included instructions to build special temples as locations for baptisms for the dead. This idea of vicarious baptism excited early Mormons who rapidly practiced it in rivers. Further revelation, however, soon brought clear directives restricting it to enclosed sacred places.

Vicarious Baptism for the Dead

Joseph had addressed himself to the idea of baptism for the dead during a funeral sermon in 1840. This teaching touched the hearts of many Latter-day Saints because it enabled them to do something of religious importance for the dead in general and for their own relatives in particular. An initial and relatively indiscriminate baptism for dead people soon passed into a more disciplined endeavor focused on one's family. This involved formal gathering and keeping genealogical

records of the dead as basic information for use in the vicarious baptism. Records were and are taken of all that took place. It was established that men should be baptized for male kin and women for female family members. Baptism for the dead now became the rationale for the now famous project of genealogical research compiling immense amounts of information on the dead gathered from church and civic records the world over. It also reinforced the Mormon ideal of extended family life, with the extension embracing ancestors as well as descendants.

With time and resources the Latter-day Saints built their initial large-scale temples, such as the one in Salt Lake City, installing a baptismal font at the basement level of each edifice. This circular bath-like container facilitates baptism by total immersion and stands on the backs of 12 metal oxen representing the Twelve Tribes of Israel. Many countries of the world now possess one or more such temples, buildings quite distinct from the thousands of meeting houses of Mormons that provide the basic organization for weekly worship and that contain rather ordinary fonts for the baptism of the living.

Many non-Mormons often misunderstand vicarious baptism, thinking that it somehow forces the dead to become Mormon. Nothing could be further from the truth, as Latter-day Saints place an absolute value on freedom of choice or personal agency. What vicarious baptism does is demonstrate the love and concern of the living for their dead as they provide them with the opportunity to appropriate in eternity the earth-based baptism conducted on their behalf. A great deal of time and effort is expended both in obtaining kinship records for as long ago as is feasible and in visiting a temple to engage in this "work" on behalf of the dead. Once the baptism has been performed, it becomes possible to conduct other rites for the dead so that they need not lack any advantage available to the living. In many respects this extensive vicarious work is summarized in the initial baptism for the dead and highlights the fact that the Church of Jesus Christ of Latter-day Saints is, essentially, a church grounded in issues of death and its transcendence. Here Mormonism takes traditional Christianity's interest in death and resurrection a step further, personalizing it in a grand theory of the individual family and its eternal bonding in a destiny to become kings and gods ruling over eternal worlds.

This large-scale institutional genealogical research and vicarious ritual practice should not, historically, be totally removed from Joseph Smith's profound grief following his elder brother, Alvin's, sudden death, when the officiating Protestant minister raised doubts over Alvin's heavenly destiny. This was when Joseph was about age 18 and some 7 years before he founded his church in 1830. He later spoke of his youthful heart as swollen and almost bursting with pangs of sorrow at Alvin's death. In 1836, when the new temple at Kirtland, Ohio, was being consecrated, Joseph has a vision in which he sees Alvin in heaven alongside divine figures (DC 137:5). This seeming paradox of Alvin's heavenly location despite his having died before the church was founded and without having been baptized is likely to have influenced ideas on baptism for the dead. This case shows how issues of death and changing cultural contexts could revitalize a biblical text that had laid relatively dormant for nearly 2 millennia.

Bereavement, Grief, and Mourning

The word *bereavement* is the noun form derived from the verb *bereave,* an Old English word that first appeared in 888 C.E. in King Alfred's translation of *The Consolations of Philosophy*. Since around the year 1650 the term *bereft* has referred to loss of immaterial possessions such as life and hope, whereas *bereaved* denotes a loss of a significant other such as a relative through death. The term *bereavement* is used to denote a condition of being bereaved or deprived.

Grief has multiple meanings, all of which deal with the subject of hardship, suffering, injury, discomfort, mental pain, and sorrow. The earliest citation for grief as some form of hardship or suffering is found in Middle English used in the year 1225; grief in the sense of sorrow as a result of loss or personal tragedy first appeared in Middle English in 1350.

The word *mourning,* derived from the verb *mourn,* first appeared in the same Old English manuscript in which *bereave* was used. To mourn is to express one's grief, to lament someone's death, to experience sorrow, grief, or regret.

Dimensions of Bereavement

Bereavement has a holistic or multidimensional impact. Scholars from philosophy, psychology, sociology, and psychiatry point out that bereavement manifests itself physically, emotionally, behaviorally, cognitively, interpersonally, and spiritually. The following examples serve to illustrate:

- *Physically* a bereaved person may experience fatigue, chills, and diarrhea.
- *Emotionally* a bereaved person may feel guilt, anxiety, loneliness, and fear.
- *Behaviorally* a bereaved person may experience bouts of crying and may have trouble sleeping and eating.
- *Cognitively* a bereaved person may have difficulty concentrating and remembering and may be flooded with intrusive images and thoughts.
- *Interpersonally* a bereaved person may remain isolated from others, may find others uncomfortable in his or her presence, and may lash out unpredictably at others.
- *Spiritually* a bereaved person may question the meaning of existence, lose hope, and feel adrift in the world.

The contributions of two scholars, namely Sigmund Freud and John Bowlby, dominate Western cultural thinking about bereavement, grief, and mourning. Since the mid-20th century most writing on bereavement, grief, and mourning emerges from responses to Freud, Bowlby, or both. Freud's seminal paper, translated as "Mourning and Melancholia," involved his efforts to delineate more carefully what today is referred to as clinical depression. Freud compared and contrasted the normal responses to irreparable loss that are found in grief to the pathological responses found in clinical depression. For Freud, when we have a deep emotional investment in another person and that person dies, we engage in denial, not accepting that loss, and fight against relinquishing our emotional investment. Bereavement resolution involves intense, gradual work to demonstrate that the loss occurred and to free one from the emotional attachment placed in the deceased person.

Freud posed that bereavement recovery requires three arduous tasks. First, it is essential to encounter all reminders of the deceased so that eventually they don't produce emotional pangs. Second, it is imperative that one detach emotionally from the person who has died. Third, it is important to construct an emotionally neutral mental representation of the deceased that makes possible remembering the person without suffering the distress of bereavement. Freud's depiction of dealing with bereavement has become known as "grief work."

Dimension of Grief

Freud emphasized that grief is a normal response to the death of a loved one, and he said were it not for personal acquaintance with the effects of bereavement, it would strike him that the intense distress of the griever is pathological. What normal bereavement requires is time and hard work, not professional intervention. Bereavement is a

human misfortune, rather than a pathological condition, and Freud emphasized that a griever does not need referral for professional help.

Erich Lindemann, an American psychiatrist, attempted to build on Freud's idea of grief work when he worked with over 100 persons, most who were bereaved following a massive fire at a Boston restaurant in the early 1940s. Based on this effort, Lindemann's research paper became influential among grief counseling practitioners and for scholars writing about bereavement. Lindemann noted that grieving patients would begin to recover from acute grief once they (a) allowed themselves to feel the distress associated with their bereavement and (b) openly talked about their grief. Ignoring Freud's assertion that grief work required time, not professional intervention, Lindemann made Freud's notion of grief work the standard for understanding what grieving entails.

Lindemann's identification of an acute grief syndrome, a set of seven associated symptoms, has become a landmark contribution. The seven symptoms are the following:

1. Somatic distress occurring in regular waves and lasting from 20 to 60 minutes and manifest in such ways as shortness of breath, trouble eating, utter exhaustion, and sighing
2. A sense of unreality since the death
3. Increased emotional distance from others
4. Intense preoccupation with images and thoughts of the deceased
5. Feelings of guilt
6. Irritability and unprovoked outbursts of hostility
7. Loss of patterns of conduct manifest in such ways as restlessness, difficulty making decisions, aimlessness, and difficulty staying focused

Lindemann also invented the concept "anticipatory grief reactions," which has influenced scholars' speculations, though not without controversy. The concept described the reactions of some women whose expectations their husbands would die in combat in World War II led the women to grieve the men's deaths and emotionally detach even though their husbands had not lost their lives. A contemporary focus of this concept is on grief reactions to learning a loved one is terminally ill.

John Bowlby was a British psychiatrist whose influential thinking about bereavement, grief, and mourning was stimulated by the British government's solution to protect children from being killed at the height of the Nazi bombing of England's cities. The British government separated children from their parents, sequestering these children in the interior of the country. Bowlby was asked to examine the effects separation from parents had on the children, and from this examination his view of bereavement emerged. Whereas Freud referred to psychic processes to explain responses to irreparable loss, Bowlby turned to ethology and to Darwin's thinking on evolution. Maintaining that the survival of mammals depends on close bonds established between infants and caregivers, Bowlby believed that attachment bonds are biologically hardwired, so to speak, into the human species, and the types of attachment a youngster develops with caregivers influence the kinds of relationships that individual will form over his or her life span. The three basic types of attachment bonds identified include secure bonds and two types of insecure bonds: (1) anxious/avoidant bonds and (2) anxious/resistant bonds. A child's responses upon being reunited with parents are influenced by the type of bonds between the parent and the child: Secure children show great pleasure at being reunited, avoidant children seem distant, and resistant children show hostility.

Bowlby used the construct of attachment bonds as his primary theoretical explanandum. Bereavement, grief, and mourning represent naturally occurring responses when attachment bonds are sundered. Thus, bereavement has a fundamental social basis in Bowlby's thinking.

Kenneth Doka's concept of "disenfranchised grief" extends this social context for bereavement thinking. Specifically, two social judgments are noted: (1) Some losses are considered marginal, illicit, or immoral, and (2) grief over such losses is proscribed. Examples include grief over miscarriage, the death of a pet, death of a mistress, and death of a homosexual partner.

Empirical data demonstrating various types of attachment bonds influence contemporary thinking about bereavement. Secure attachments have

been found to characterize normal bereavement responses. Types of attachment concomitant with different styles of coping with stress produce different responses to loss. Bereaved persons whose bond to the deceased had been secure are flexible in their response to loss; persons with insecure attachments exhibit constrained thinking and action. In particular, insecure attachments are thought to produce bereavement complications, such as the difficulty experienced in socially constructing the meaning of the loss. Meaning reconstruction in the face of bereavement is at the heart of the thinking of several influential scholars. What is at stake is relearning one's relationship with other persons, with the world at large, and with oneself. This relearning may require developing completely new frameworks or schema for understanding existence, and in other cases may only require making a loss fit a current conceptual framework.

A Process Model of Grieving

Bowlby described the grieving process in terms of phases:

1. *Numbing phase*. In this first phase, the bereaved person seems incapable of comprehending the loss. A person will say such things as, "I can't believe this has happened."
2. *Yearning or searching phase*. In the second phase, the bereaved person seems preoccupied with thoughts and feelings about the deceased and by a desire to recover what has been lost.
3. *Disorganization and despair phase*. This third phase emerges as the bereaved person realizes the dead person cannot be recovered. Apathy may set in as the person struggles to find ways to cope with an irreparable loss. The challenge is to discard familiar patterns of thinking, feeling, and acting.
4. *Reorganization phase*. The final phase of Bowlby's model denotes a time when a person begins redefining his or her identity and place in the world. Such reorganization not uncommonly requires learning new roles, as when a middle-aged widow returns to the workforce after a 20-year absence or a widower learns how to cook and do laundry.

J. William Worden, an American clinical psychologist, developed an influential model that explains coping with bereavement in terms of four tasks:

1. Accept the reality of the loss.
2. Work through the pain of grief.
3. Adjust to an environment in which the deceased is missing.
4. Withdraw emotional energy and reinvest it in another relationship.

Empirical research challenged the original conceptualization of the bereavement resolution process, principally from advocates who argue that continuing bonds was a common bereavement outcome, thus causing Worden to revise task 4, that is, to emotionally relocate the deceased and move on with life. The rephrasing, while still very close to Freud's overall idea of letting go, suggests the possibility of maintaining a continuing attachment to the deceased.

Some scholars challenge the notion that emotional detachment from the deceased is necessary for bereavement resolution. Thus, it is proposed that a correction called "continuing bonds" is required. It is not uncommon for bereaved persons to constructively face the loss of a significant other while remaining attached to the person who died. This latter emphasis on continuing bonds has captured the attention of many scholars and clinical practitioners, leading in turn to the following irony: Whereas traditional views portrayed ongoing attachment as pathological, some experts argue that a lack of ongoing attachment bonds is an indicator of pathology.

The Dual Process Model of Coping

The dual process model of coping with loss has been proposed as a refinement to the notion of grief work. Clinical work with bereaved persons indicates two distinct processes, not merely a confrontation with distress but also enabling bereaved persons to adapt to their loss. Grief work is accepted as being important to enable one to focus on the distress of one's loss. However, it is also important to attend to other aspects of life. The dual process model asserts that a part of

bereavement requires us to experience a loss orientation (the grief work notion) and also to establish a restoration orientation in which life goes on. Bereaved persons oscillate between these orientations as they deal with their bereavement. Such oscillation is normal; it is what people do naturally. Thus, any bereavement care program that emphasizes only grief work would be incomplete.

More recently, scholars who advocate the dual process model have sought to refine the model by further evaluating types of attachment bonds. Whereas empirical data indicate that secure attachments prior to a death can lead to bereavement resolution with ongoing attachment after the death, in cases of insecure attachment bonds prior to the death, a letting go or detachment is in the best interest of the griever. In short, not all deaths produce bereavements with ongoing attachments, nor should they.

Bioethics, History of

The history of bioethics relating to death and dying is, like any philosophical endeavor, about questions and answers. The fundamental challenge to developing a cohesive and consistent approach to such a complex history is that the questions are raised in a pluralistic context in which participants enter the discussion with a variety of religious, ideological, philosophical, educational, and vocational backgrounds. These differences can serve to open new perspectives on a problem, and the history of bioethics is, in part, one of grappling with diverse approaches to moral issues that yield equally diverse responses. These differences can lead to significant impasses, as frequently the end point of a discussion is not an agreement to continue the discussion but rather is a concrete action, one that perhaps must be undertaken with some urgency and may be irrevocable—examples of such include withdrawal of a ventilator, stopping hydration or nutrition, enrolling a dying patient in a research trial with a significant burden of involvement with medical institutions, or actively participating in the death of a person. Such a practical conclusion to a discussion with such high stakes—human death is often at the center of the struggle—lends great significance to this history, and a number of attempts have been made to distill principles that are broadly applicable and comprehensive.

Significant Historical Events

Of the historical events shaping this effort, several have been seminal in the development of contemporary understanding of bioethics as it relates to death and dying, as well as to the structure of research involving human subjects facing potentially lethal diseases. In the United States, one of the earliest influences in the history of ethics—affecting the evolution of ethical codes

that offer guidance in medical decision making—was Dr. Benjamin Rush from Philadelphia who had great interest in moral issues around the time of the American Revolution, issues he addressed in lectures to medical students at the University of Pennsylvania. His work led to the Second National Medical Convention in the mid-1800s in which a committee was charged with drafting a code of medical ethics. Though the code of ethics of the American Medical Association that resulted from this effort had its critics, it was largely praised by the medical community. As new technologies (such as anesthesia and advances in surgical techniques) carrying both benefit and risk were developed, ethical issues arose centering around both the transformation of medicine into a scientific discipline and the idea of physician competence as the basis for ethical evaluation. During the 20th century, authority over patients shifted from the locus of physician duty to that of patient rights, a fact that affected subsequent work significantly. The American Medical Association Code of Ethics underwent several revisions, changing in concert with the evolution of the medical profession, which had achieved a firm position in society. This code, which has deeply affected debates over such issues as abortion, withdrawal of medical support, and euthanasia, is considered central to the medical establishment's vision of itself.

There have been a number of important challenges to the assumption of ubiquitous professional virtues and the moral reputation of the medical establishment. Some of the most important have occurred in the context of research; others in the context of caring for patients who have lost functions considered basic to meaningful life or patients who are suffering human moral abuses—such as those uncovered in the Nuremberg trials, the Tuskegee Syphilis Study, and the Advisory Committee on Human Radiation Experiments—have led to important questions about this assumption. The practical yield has been the production of highly influential documents such as the Belmont Report, the Declaration of Helsinki in its several versions, guidelines produced for the international arena by the Council for International Organizations of Medical Sciences, and, most recently, the adoption of the Universal Declaration of Bioethics and Human Rights in October 2005 by the United Nations Educational, Scientific and Cultural Organization. Common to these efforts are principles such as respect for persons, beneficence, and justice, which apply in both clinical medicine and medical research.

Principle-based deliberation and debate has helped to clarify the issues at stake and to attempt to provide common ground for discussion across pluralistic boundaries. It has also been criticized as being inadequate for addressing issues of such complexity and nuance. For example, casuistry, or case-based ethics, asserts that the principles always follow upon cases, instances, and concrete particulars. Bioethics properly proceeds from cases to categorical principles, not the other way around. Casuists argue (after Aristotle) that ethics is not and cannot be a science. It is rather a field of practical wisdom, a field that grows out of experience that in turn yields a recognition of significant particulars and informed prudence. A second important source of criticism of principlism, communitarianism, also derives from Aristotle. This approach argues that apart from agreement upon certain goods and goals, there is no rational way to reach moral agreement. For example, within one community, individual autonomy might be an important good, while another community deriving from a different cultural background might identify goods such as family obligation or religious authority as more weighty than that of autonomy. This weighing of goods might yield very different approaches to ethical decision making. From inside of a community, such a weighing of goods makes sense and might function as a basis for decision making. However, communitarians argue that there is no "view from nowhere" outside of a particular community that allows one to demonstrate the superiority of one community's view over another's.

Thus the history of bioethics draws from long religious and philosophical histories, from deliberative responses to events (as with the U.S. congressional response to the Tuskegee Syphilis Study), from law, and from the adaptation of past ethical responses to new situations, which are usually analogous in some respects, but which—often because of new technologies—have novel elements that present dilemmas.

Bioethics and Its Relationship to Death and Dying

Several important events have shaped bioethics as it relates to death and dying. One of the most fundamental ethical issues is the very definition of death. Two centuries ago, because of fears about premature burial, laws were passed requiring delay in burial. According to frightening tales, exhumed coffins revealed evidence that people had been buried alive. When is a person dead? We now know that death occurs in stages, a fact that underscores the importance of the philosophical dimension mentioned earlier: Is death when the person ceases to be, when the heart stops beating, or when all cellular activity comes to a halt? These three questions yield three different "times of death." The time of death is a moment of immense emotional, spiritual, and pragmatic significance. We do not take organs from the nondead, so it matters whether organs may be taken from one without brain activity versus one with no cellular activity, because the former is an organ donor who might save a life, whereas the latter might, at most, be able to donate corneas. Kansas in 1970 and Maryland in 1971 first adopted the brain-based definitions of death based upon the recommendations made a few years earlier by the Harvard Ad Hoc Committee on the Definition of Death. Because of the important effects pronouncement of death has, the decade after Kansas and Maryland embraced this criterion was filled with philosophical debate, for the question of when to treat a person as dead was not amenable to scientific methods for resolution. In 1980 the President's Commission for the Study of Ethical Problems in Medicine and Biomedical and Behavioral Research took up the question and published its report in 1981, endorsing what is known as the "whole-brain-oriented" definition of brain death. This definition has been adopted throughout the United States as well as in most countries around the world.

Much more controversial has been the debate surrounding the ethical issues related to how we approach people who do not meet the 1968 Harvard brain death criteria, for example, patients with brainstem reflexes but no higher brain function, described as being in a persistent vegetative state. Karen Ann Quinlan was at the center of the most famous case, which was tested in the New Jersey Supreme Court in 1976. This 21-year-old woman experienced respiratory arrest after consuming an overdose of tranquilizers and alcohol. Though she would never regain consciousness, she was stabilized on a ventilator. Her father wanted to act as guardian and remove the ventilator, knowing that this would result in her death. Quinlan's physician disagreed, and a lower court sided with the physician. The New Jersey Supreme Court said that the father could choose which physician he wanted for his daughter, allowing him therefore to choose a physician who would be willing to withdraw the ventilator. It was in this case that the court asked for input from an ethics committee. The Quinlan case thus brought about two important events: (1) rejection of the medical profession as having the authority to decide issues such as this, and (2) an advance in the development of hospital ethics committees charged with guiding decisions when medical staff and families are not in agreement.

The presidential commission that addressed the definition of death turned—in part because of cases like Karen Quinlan's—to questions about foregoing life-sustaining treatment. The report that emerged in 1983 emphasized the importance of voluntary choice of the patient to refuse life-sustaining treatment. The commission embraced the idea that when people are not competent to make such decisions, or else are competent but do not make their wishes known before losing competence, surrogate decision makers, generally from the patient's family, could decide such issues in the best interest of the patient. They supported the role of ethics committees in these decisions, though only a court can override the decision of a surrogate.

A number of other legal cases—such as that of Nancy Beth Cruzan in 1990, in which nutrition and hydration delivered via gastrostomy was removed after long legal controversy ultimately involving the U.S. Supreme Court—established the right to refuse ventilators, nutrition delivered via feeding tube, and other life-sustaining therapies that, in many cases, are identified not as extending meaningful life but rather as extending either the dying process or suffering.

Physician-Assisted Suicide

Perhaps the most difficult recent ethical controversy concerns physician-assisted suicide (PAS).

The issue was made prominent by media response to the efforts of Jack Kevorkian, a pathologist who openly participated in PAS. But he often did so without having any personal relationship with the patient—a fact that many found troubling. In contrast to this approach Timothy Quill assisted his patient Diane, who desired some independence and control and had a form of cancer that was 75% fatal, in the context of a long-standing relationship. In the United States, Oregon passed the Death with Dignity Act in 1997 allowing PAS. The past decade has not seen widespread embrace of Oregon's approach, and the issue continues to be debated. PAS generally involves making the means of death available to a patient—whether this means the use of the devices Dr. Kevorkian used or giving a prescription for lethal doses of medication as Dr. Quill did. A further distinction is drawn between making the means of death available and being an active agent in the death of a patient, an event in which a medical caregiver administers the lethal dose of medication, for example. Whereas in the United States precedent was set for PAS in Oregon, in the international arena precedent has been set for active involvement of physicians in euthanasia. In the past 20 years the Netherlands has opened the way for active voluntary euthanasia. The debate about such involvement of physicians often returns to the codes of medical ethics: How can a physician who is charged with care of the patient also kill the patient, no matter what the circumstance? And if active euthanasia is allowed in one circumstance, what is to stop it in other circumstances? If active euthanasia is allowed for intractable physical pain, what about intractable psychic pain? And does the disease process causing the pain have to be incurable? What if there is a 10% chance that the process can be cured in the next year? What about 5%? And what if we have to wait 3 years to find out the ultimate result? This debate is grounded in the history of bioethics and will form a significant part of its future.

Whether we are talking of medical interventions with the aim of cure, comfort, or control of one's destiny, there are two questions that must always be asked: What can be done next? and What should be done next? The means for answering the first question is scientific. The means for answering the second question is often more philosophical, drawing on many sources of wisdom and insight that are not intrinsically scientific in their approach. History has taught us that scientific advances without ethical considerations can become horrific. Likewise, wisdom without scientific advances cannot further the effort to cure the sick. Medical science committed to ethical research offers the best possibility for continuing the advancement of cures for human disease accompanied by humane and ethical responses to the realities of human suffering and death.

Body Disposition

Body disposition is the act of dealing with a human body after death. Worldwide, people have found various ways to dispose of human corpses. Death confronts people with a corpse that unavoidably needs to be subjected to some sort of treatment. Humanity has treated dead bodies in accordance to culture, religion, family needs of the deceased, and the deceased's wishes. It seems to be impossible to accomplish the disposal of a corpse without ritual.

The emotions aroused by death are frequently used to explain the subsequent body disposition. One of these emotions is people's fear of a corpse. Throughout the world, attitudes to the decomposition of corpses vary greatly. Hertz gives three explanations for this variation in attitudes. The

first he mentions is the fear for bodily decay and the hygienic consequences. Some people think that corpses have to be disposed of as soon as possible to minimize health risk. In fact, most dead bodies do not form a real health hazard with the exception of cases of infectious diseases, like plague. The second reason for the variation of attitudes is the social status of the deceased. The intensity of emotions differs depending on the life a person has led and his or her social status. The third explanation is the connection of the dead body to the soul. Hertz explains that people fear the soul, because it is considered to remain with the living until the bodily decay is completed.

Despite the variety in body disposition, two universal ways to dispose of a human corpse are burial and cremation. Within burial and cremation practices, there is also a great diversity. For example, there is burial under ground, burial at sea, the exposure of a body to the open air, cremation on a pyre, and cremation through extreme heat. Whatever choice of body disposition, the process is dynamic. The chosen method of disposition does not need to be a final act. Someone can be exhumed after burial, and the remains can then be cremated. Furthermore, the ashes can be used in different ways too.

Besides cremation and burial, there are several alternative ways of body disposition, such as preservation of a body by embalming and mummification, the donation of a body to science, plastination (a preservation technique used for the exposition of human corpses), cryonics (the preservation of a body by deep freezing), and, very seldom, mortuary cannibalization.

Burial

The disposition of a human body by putting it into the ground, called inhumation, dates back to the dawn of human history. It is still the most practiced form of body disposition. Archaeological evidence from prehistoric times points to this oldest form of burial by covering the body with soil and stones, or by placing the body in a cave. In the first decade of the 21st century, inhumation is still a common way to dispose of the dead. People can use a coffin (a box to bury the dead in) and place a stone on the grave as a marker, a point of identification and memorial. Other people, like Muslims, use clean, white cloths in which to wrap the deceased before burial.

Depending on the religion of the deceased and his or her family, choices were made about the posture and location of the body. For example, ancient Egyptians were positioned facing toward the West; many Christians buried their dead close to sacred places and laid them on their back with the hands in a praying gesture; and Muslims laid their dead with their right side facing Mecca.

Throughout the world, in times of disaster and war, people have used mass graves to dispose of a large number of corpses—for example, after a natural disaster such as an earthquake and during the genocides of World War II, Bosnia, and Rwanda. As most of the bodies in a mass grave are unidentified, it is difficult to locate missing people or give a confirmation of their death to the family. Major stress can be caused by the fact that the bereaved have not had the opportunity to dispose of the body of the deceased according to their own notions and rituals.

An alternative way of burial is the disposition of a body at sea. Occasionally, this method is chosen for a practical reason, such as when someone dies on board of a ship at sea. The body is deposited into the so-called watery grave. Contrary to this unforeseen way of disposition at sea, burial in water can also be a chosen action. Vikings placed the corpses of their deceased in longships and set them adrift. Among islanders in the South Pacific, the dead were placed in a canoe and sent off at sea.

Another way of body disposition is the exposure of a corpse to weather conditions or scavenging animals. The Zoroastrians, adherents of the religion Zoroastrianism, who live mainly in India and Iran, used this kind of burial. They place the body of the dead on hills where they are left exposed to the climate and scavenging birds and animals. In Tibet this method is called "sky burial"; a corpse is cut into pieces before it is exposed to scavenging birds. Another example of exposure comes from the Solomon Islands where the body was placed on rocks to be scavenged by sharks at the time of rising tide.

Another way of body disposition is tree burial, the exposure of bodies in trees and platforms, which can be found among Native Americans, the Sioux. They dressed the dead in their best clothes, sewed them in a deerskin, and exposed them on a

platform in a tree. After a period of time the body was brought back and given a burial in soil. In the examples given, exposure was understood as a sign of respect and honor. However, throughout time, exposure of people, for example, by leaving them hanging on the gallows, developed a connotation of humiliation rather than a sign of respect and honor. It becomes clear that it depends on the social, cultural, and religious aspects what meanings are ascribed to the chosen way of human disposition.

Cremation

Cremation is the disposition of a body by burning the body down to ashes and bone fragments. As early as 1000 B.C.E., the Greek were using this method during war. The corpses of soldiers were incinerated on the battlefield, and the ashes were sent home. The Romans also used cremation as a way of human disposition. After cremation, they put the ashes in an urn and placed it in a columbarium, a special wall with niches. After Europe converted to Christianity, use of cremation decreased. Cremation and the Christian idea of the resurrection of the body were regarded as incompatible because a physical resurrection would not be possible after cremation. Cremation was used only to dispose of a large number of corpses in times of disasters or outbreaks of contagious diseases. In 1886, the Vatican prohibited Catholics to use cremation as a way of body disposition; the ban lasted until 1963. Cremation was revived in Europe in the 19th century but saw little use. Popularity of cremation in Europe rose at the end of the 20th century. Most current Christian denominations allow cremation. However, doctrines of Orthodox Judaism and Islam forbid the practice of cremation.

In contrast to the situation in Western countries, cremation has always been practiced in India, by both Hindus and Buddhists. Hindus believe that human disposition by cremation is the right way to release the soul from the body. According to Hindus, the best location to cross from this world to a new world is on the sacred river Ganges. The holy pilgrimage city Varanasi, sited on the banks of the Ganges, is considered particularly appropriate for cremation. On a daily basis, cremation takes place in this holy city at pyres on the banks of the river. Hindus also use the Ganges for the immersion of ashes that were cremated elsewhere.

In North America and Europe, instead of an open fire, a cremation retort is used, a chamber where the body is transformed into bone fragments and ashes through extreme heat. Sometimes, the remains are put into a mill, which grinds the remains into white ashes. In many countries, it is illegal to burn more than one body at a time in the cremation retort. Each country has its own regulations for the scattering of ashes. Countries like the Netherlands and the United Kingdom return the ashes to the bereaved. They can decide the final destination of the ashes, whether they are scattered at sea, in the woods, or in a garden; or whether they are stored in an urn, buried at a cemetery, placed in a columbarium, or processed in mourning jewelry. The options are manifold.

Alternative Ways of Body Disposition

Besides burial and cremation, people can choose other methods of body disposition. In this section, the following alternative options are discussed: (a) embalming and mummification, (b) body donation to science, (c) plastination, (d) cryonics, and (e) mortuary cannibalism.

Embalming is a technique used to preserve a body by postponing the decomposition process. While modern embalming postpones the decomposition process only for a few weeks, mummification is intended to be permanent. A body can either be permanently preserved through mummification due to natural conditions, such as being trapped in clay or ice, or it can be preserved through human intervention. One of the earliest forms of mummification by human intervention is found among the Chinchorro of Chile. Archaeological findings of their mummies date back to 5000 B.C.E. Well known are the mummies of the ancient Egyptians and the pyramids built to protect them. Essential parts of the mummification process were the removal of the brain and the internal organs and the covering of the body in natron, a mineral used to dehydrate the body. Finally, the body was rapped in bandages and placed in a special body container, a sarcophagus. Even in the 20th century, people were mummified. The mummy of Lenin is still on public display in an elaborate tomb in Moscow.

Embalming is a more contemporary practice than mummification. Modern embalming is not

intended as permanent preservation. It aims particularly on sanitation, preservation, and presentation. It is a common practice in the United States, which became popular during the American Civil War when the need emerged to bring soldiers who died on the battlefield home. Modern embalming involves the injection of chemicals directly into the body and the appliance of cosmetics to the body. In the United States, embalming is used mostly for the viewing or visitation of the body before the final body disposition, to improve the visual appearance of the deceased, and to stop the bodily decay temporarily.

Body donation to science is an alternative way of body disposition that entails the donation of a body to an anatomical center. The donation of a body to science is a strictly voluntary act today, but in the past this was different. Cadavers of executed criminals, or bodies robbed from graves, were used frequently. The Dutch artist Rembrandt van Rijn painted *The Anatomical Lesson From Dr. Nicolaas Tulp* (1632) picturing an anatomy lesson in Amsterdam where the body of an executed criminal was used. It was regarded an additional punishment for the criminal to be dissected in public. A special type of public theater was built, called *Theatrum Anatomicum,* for public demonstration of dissections. Dissection takes place in an anatomical center that uses dead bodies for scientific research and education of human anatomy. If people decide to donate their bodies, they have to arrange this before they die. It is only by personal approval, written down in a signed contract between an anatomical center and potential donors, that people can donate their bodies. Throughout the world, each center has its own rules and formal procedures. Anatomical centers apply different preservation methods to preserve the tissue. This is done by inserting a cocktail of chemicals in the body or by freezing the corpse. Both methods stop the process of decay. Embalmed bodies are used mostly for education of students and frozen bodies for the training of surgeons. Defrosted bodies approximate living bodies better than embalmed bodies do and, therefore, are often used for the training of surgeons. When the bodies or the body parts are of no further use to the anatomical center, they are disposed of, either by cremation or burial.

Another way to dispose of a body is the donation of a body for plastination. Plastination is a preservation technique invented by Gunther von Hagen in 1977 in Heidelberg, Germany. This technique consists of replacing the natural body fluids with a plastic to preserve the tissue, which makes it possible to display the body in any desired position. In contrast to embalmed bodies, which are wet, plastinated bodies are dry and odorless, which makes them suitable for exhibition. The technique preserves the body for an indefinite period of time. The first exhibition with plastinated bodies was *Body Worlds* from von Hagen in Japan in 1995. Body Worlds has been traveling through the world ever since. It is comparable to the exhibition from Roy Glover called *Bodies*, which opened in Florida in 2005. Both have attracted millions of visitors, and both have created controversy. Questions focused on whether the body donors gave their consent and whether the display of the bodies was ethically sound.

Cryonics is the preservation of a human body by cooling the body down to stop physical decay. Cryonic supporters hope that in the future, advanced technology will be able to revive their bodies after death. They believe that the human identity is stored in the brain and, therefore, by conserving the brain structure people should be able to conserve their identity.

The idea to deep-freeze people was developed by the physics teacher Robert Ettinger, who founded the first cryonic organization, the Cryonics Institute, in 1976. The first person to be frozen was Dr. James Bedford, who is still stored today. This is not the case with all the bodies that have been preserved in the early days of cryonics. Due to financial problems of certain organizations, some bodies thawed. There are still two organizations for cryonics, both located in the United States. As of October 2008 the Alcor Life Extension Foundation in Arizona is storing 84 bodies, and the Cryonics Institute in Michigan, as of December 2008, is storing 91 bodies.

There are several methods to deep-freeze a body. The first method is to cool the body down to –196 °C in liquid nitrogen. However, this freezing process will damage the body severely; this damage is irreversible. A newer technique that has been developed to prevent the damage caused by the freezing process is called vitrification. The damage of the freezing is reduced by replacing water in the body with protective chemicals. This

technique can be used only for single organs and is, therefore, only used for the preservation of heads, called neuropreservation. In the Alcor Institute, people can opt to store their head only from which the brains are treated with the superior technique of vitrification, or they can choose to store their whole body with the more expensive but inferior method of deep freezing.

Cannibalism, also called anthropophagi, is the consumption of human body (parts) and can be considered, in a way, as a means of body disposition. In most cases, mortuary cannibalism concerns only the consumption of small body parts. The Berewan of Borneo prepared rice wine with the body liquids from the process of bodily decay, and the Amahuaco Indians of Peru drank a mix of cremated body remains with corn. In other cases, the mortuary ritual consisted of the consumption of the whole body. An example is the former mortuary rite of the Wari in Brazil. They practiced both the consumption of people outside their group, exocannibalism, as well as the consumption of their own people, endocannibalism. In the first case the focus of the rite was on humiliation and disrespect, whereas in the second case the focus was on respect and honor for the deceased. The occurrence of another form of mortuary cannibalism emerged in times of disaster, during war, or in exceptional cases of an airplane crash. In these cases, mortuary cannibalism was used as a last resort.

Body Farms

A body farm is a research center where scientists study the human decomposition process. These facilities provide an environment whereby death and decay can be scientifically examined by replicating various settings. Body farms are an important component to better understanding the human decay process and how particular environments may affect the deceased's body. For example, scientists may reenact a murder victim left in a body of water for days prior to discovery or a victim burned posthumously. By studying the process by which bodies decompose when left to the elements, it is possible to accurately determine the postmortem interval in real time and recover any evidence of foul play. Thus, the data collected at body farms provide crime scene investigation teams and forensic anthropologists with important information regarding decomposition and proper techniques for collecting evidence from a victim's remains and the surrounding crime scene area. Because bringing a perpetrator to justice often requires that investigators place the criminal at the scene, the body farm staff are primarily interested in accurately determining the time of death based upon the state of the body upon discovery.

The first body farm was established in 1981 by Dr. William Bass, a forensic anthropologist at the University of Tennessee, Knoxville. Located on a 2.5-acre plot of land behind the University of Tennessee's Medical Center, "the Body Farm," as it is known around the world, is a fenced-in wooded site where Bass, now retired, and his graduate students place dozens of bodies and carefully record the rate of decomposition and the bacteria and insect activity for each of the death

scenarios. Once it becomes skeletonized, the staff then removes the remains and stores the bones for further research. Each body is systematically labeled with a set of numbers that corresponds with the deceased's arrival at the laboratory. For example, the fifth body donated in 1990 would thereafter be referred to as "5–90," even after skeletonization has occurred, in an effort to protect the identity of the donors. Bodies used for study at the University of Tennessee's body farm come from two sources. Staff members either take possession of unclaimed bodies left at the state medical examiner's office or, alternatively, people make arrangements prior to their death to donate their bodies. Each year between 30 and 50 people apply to donate their remains to Tennessee's body farm.

The body farm founder was a forensic anthropologist. Along with his role in founding the University of Kentucky's Forensic Anthropology Center in 1971, Dr. Bass served as a technical expert for many local and federal investigations. Body farms have now become an important tool for criminal investigators and lawyers because, prior to 1971, no one could determine with any certainty if a decomposed body was indeed a crime victim if there wasn't a bullet hole or other obvious evidence of struggle. Bass and his research staff have collected hundreds of remains, most of which have been left to skeletonize naturally after being exposed to the elements. This database of information is available to law enforcement and has allowed investigation teams to systematically compare their case to remains found in similar situations. The body farm's ability to re-create the decomposition process in a controlled environment has aided many criminal investigations and helped scientifically determine whether or not a body was indeed a victim.

Along with his scientific and academic contributions, Bass coauthored a number of books with journalist Jon Jefferson. Writing under the name Jefferson Bass, the two men have published two nonfiction books about the body farm, *Death's Acre* (2003) and *Beyond the Body Farm* (2007), as well as a fictional series about the body farm, including the titles *Carved in Bone* (2006) and *The Devil's Bones* (2008). The scientific work conducted at the body farm was also the inspiration for crime novelist Patricia Cornwell's 1994 best-selling book *The Body Farm*.

Along with the University of Tennessee's body farm, there are currently two other facilities in the United States. The second to open, Western Carolina University's body farm is affiliated with the Western Carolina University's forensic anthropology lab. This farm has the capability to hold six bodies in a facility approximately the size of a single car garage. This lab was opened in 2007 to better examine how the mountainous terrain of western North Carolina impacts human decomposition. The third and largest U.S. body farm opened for operation in 2008 at the University of Texas–San Marcos. This lab is nearly double the size of the Knoxville, Tennessee, farm.

Brain Death

It is commonly accepted within the medical profession that a person is dead when his or her brain is dead, an understanding that has largely supplanted earlier cardiopulmonary criteria for death. This definition evolved in the context of common use of mechanical ventilation, which allowed the artificial maintenance of cardiac and pulmonary integrity even after the patient's brain no longer functioned. The fact that patients without consciousness, brain-stem reflexes, or measurable electrical activity in their brains can be sustained for long periods of time with mechanical ventilation led a committee at Harvard Medical School

to address the issue of brain death in 1968. This committee defined brain death as a lack of responsiveness, movement, breathing, and brain-stem reflexes in the context of coma for which a cause has been identified, a state known as whole brain death (WBD). In the wake of the Karen Ann Quinlan controversy in 1976, many states worked to formally establish brain death as an acceptable criterion for death. Formal guidelines were published in 1981 by the President's Commission for the Study of Ethical Problems in Medicine and Biomedical and Behavioral Research. These recommendations included the use of confirmatory tests to reduce the length of required observation, ruling out shock before diagnosing brain death, and allowing a 24-hour observation period in cases of anoxic brain damage. After the guidelines were published, a number of individual states developed specific requirements, such as the need for two physicians to confirm brain death, permission for registered nurses to declare death with subsequent confirmation by a physician, and in some cases requirements that specific religious objections be honored.

In order to offer evidence-based practice parameters that might allow a more consistent approach to diagnosing brain death, the American Academy of Neurology published a report describing various clinical tools that might be used to establish brain death, including a description of apnea testing. Such guidelines are important because though the ideal might be for an experienced neurologist or neurosurgeon to evaluate patients, many smaller communities might not have access to such a medical professional. Several elements are required for the diagnosis. The absence of brain-stem reflexes must be documented. Brain-stem reflexes include response of pupils to light, the corneal reflex, the gag reflex, coughing with suctioning, sucking/rooting reflexes, and eye movement in the direction of the tympanic membrane stimulated with cold water after the head has been tilted 30 degrees (cold caloric stimulation). Likewise apnea must be documented.

Apnea is documented by disconnecting a patient from a ventilator and watching for breathing efforts as arterial carbon dioxide is monitored. It is defined as no respiratory effort at a partial pressure of carbon dioxide of 60 mm Hg or 20 mm Hg higher than the normal baseline. During apnea testing, the patient continues to be oxygenated. Coma is documented by absence of motor responses to painful stimuli, such as pressing on the nail bed of a finger or the supraorbital nerve above the eye socket. Computed tomographic scanning is important for determining the cause of brain death, though it does not replace careful examination. Similar guidelines were published in Canada in 2000 by the Canadian Neurocritical Care Group.

Confirmatory tests are available; these include transcranial Doppler ultrasonography, electroencephalography, cerebral angiography, and cerebral scintigraphy. These are most often used with child patients. For babies that are 2 months old or younger, two confirmatory tests are recommended, and for children between 2 months and 1 year old, one confirmatory test is recommended. For people over the age of 1 year, confirmatory tests are optional. In 1987 the American Academy of Pediatrics Task Force for the Determination of Brain Death in Children offered guidelines for brain death in children. Like the broader guidelines, these include coma, apnea, absence of brain-stem function, absence of movement, and no confounding circumstances such as hypothermia. However, they add that the clinical criteria are not useful in cases of infants under the age of 7 days, though they are useful with confirmatory testing in older babies. The application of strict criteria to young patients has not been uniformly accepted because of the lack of data about the ability of very young children to survive severe brain insults (e.g., through prebirth hypoxia), and the ethical concern that if such guidelines become standard despite the absence of data, pressure for such things as organ donation might unduly influence the recommendations of pediatricians attending to patients and families at the bedside.

Variations and Challenges

Though most countries have practice guidelines for brain death, there are variations internationally. For example, confirmatory tests are optional in many Central and South American countries while they are required in many European countries. Though practice guidelines have been developed in some African countries, including South Africa, many African countries do not have such guidelines. Some countries, such as Iran, Indonesia,

and Bangladesh, require that three people confirm the diagnosis of brain death. Other countries require two physicians but exclude the treating physician from the assessment.

In addition to international variations there are sometimes religious objections to the use of brain death as a criterion for death, though most religious denominations accept the criterion of brain death. For example, in the orthodox Jewish tradition, if the heart is functioning and the blood is circulating, even if the brain is not functioning, death has not occurred, though this does not necessarily mean that life must be prolonged artificially. Though in the Council of Islamic Jurisprudence held in Amman, Jordan, in 1986 brain death was accepted, and in the Third International Conference of Islamic Jurists brain death was equated with death, there has still been debate among Islamic scholars. But the issue of organ transplantation continues to spark debate about brain death, and most Islamic scholars now accept brain death as a religiously permissible definition of death. In Catholicism Pope Pius XII said that "it is for the doctor to give a clear and precise definition of death and of the moment of death," which many have taken as sufficient justification for the medical community's embracing of the brain death criterion. However, there continues to be debate as in a 2005 meeting at the Pontifical Academy of Sciences, where a subgroup concluded that diagnosis of death by neurological criteria alone is theory, not scientific fact, and is not sufficient to overcome the presumption of life.

The WBD criterion has come under critical scrutiny from other quarters as well. Some have argued that the clinical tests used to diagnose WBD are insufficient to prove that all critical brain functions have ceased. Parts of brain function are not tested—hypothalamic function, for example, which is critical for neurohormonal regulation and is an important part of the integrative function of the brain. Furthermore, there are some important functions of an organism that are not controlled by the brain or not controlled by the portions of the brain tested in an examination to determine WBD (such as energy balance, wound healing, immune responses to infection, and gestation of a fetus) that are uncharacteristic of the dead. From this perspective, WBD is not seen as death but rather as a severe disablement that frequently predicts death (understood as a loss of biologically integrated activity). Often such critics advocate a new definition of death that is not centered on biologically integrated functions of an organism, thus avoiding the alleged incoherence in equating WBD with death.

Brain Death and Organ Donation

One of the most important corollary issues related to brain death is the issue of organ donation. The number of cadaveric donors of organs fails to keep pace with the number of patients awaiting organs for transplant. Among the several important steps that allow a potential donor to become an actual donor, rapid and accurate determination of brain death is central. Physiological deterioration is common after brain death. Inefficient determination can lead to loss of valuable organs through delays that allow profound hemodynamic (hypotension following from low fluid volume, blood loss, or diabetes insipidus) and metabolic abnormalities to occur, damaging the organs. It is estimated that because of such events, which occur while waiting for a formal declaration of brain death, 15% to 25% of potential donors are lost. These are the sorts of cases in which use of a confirmatory test such as a nuclear brain flow scan can confirm brain death quickly after the initial clinical examination. In this way the time to declaration of brain death can be reduced and the likelihood that a potential donor can become an actual donor is increased. In addition to speeding the time to diagnosis, more organs might be salvaged by continuing to aggressively treat patients with severe brain injury in order to minimize adverse physiological changes prior to determination of brain death. These issues continue to be addressed through education and policy development.

Brain Death and False Positives

Inaccurate determination of brain death can lead to ethically inappropriate donation. There are a number of conditions that can mimic brain death. Hypothermia and drug intoxication are two that are addressed in the criteria for diagnosing brain death. In potentially reversible severe hypothermia in which the core temperature drops below 28°C, even brain-stem reflexes disappear. Excessive ingestion of drugs such as barbiturates can lead to

loss of some brain-stem reflexes. Many drugs can be detected by toxicology screen. Unfortunately some metabolites of drugs such as the opioid Fentanyl cannot be detected by routine screening tests and may require special tests. When there is suspicion of an undetected sedating substance, in the absence of a clear confirmatory test longer observation is generally necessary.

Another entity that can mimic brain death is "locked-in syndrome." This syndrome is often caused by an embolus to the basilar artery and leads to an inability to move the limbs, grimace, or swallow. Likewise the reversible Guillain-Barre syndrome (which is an ascending paralysis involving all peripheral and cranial nerves evolving over several days) can be mistaken for brain death, and in such cases the history is crucial for avoiding the mistake. Other substances such as diethyl organophosphorus insecticides can cause syndromes mimicking brain death, and because these organophosphates are absorbed into fat, their release can be delayed so that the signs mistaken for brain death do not show up until days after the ingestion.

In all of these cases, good physical examination must be coupled with good history taking to avoid making serious mistakes. Here too, use of confirmatory tests such as multimodality evoked potentials cannot only help to avoid delay in diagnosis of brain death but can also avoid errors in diagnosing brain death that might lead to unfortunate consequences.

Buddhist Beliefs and Traditions

A dead body was one of the four sights that a young prince named Siddhartha saw when he ventured outside the palace walls. Encountering sickness, old age, and death for the first time forced the prince to confront the sufferings and impermanence of life. The fourth encounter, the sight of a serene mendicant, pointed up an alternative path to untangle the mysteries of life and death. These experiences caused the young prince to abandon a life of comfort and luxury and to embark on a journey to seek the meaning of life. As legend has it, 6 years later he achieved a great awakening. He discovered that all sentient beings are afflicted by *dukkha* (suffering and dissatisfaction), that the causes of *dukkha* are discernible, that an end to *dukkha* is possible, and that there is a path to attain liberation from *dukkha*. Having awakened to these "four noble truths," Siddhartha became a Buddha, an awakened one. Known as Buddha Sakyamuni, he is said to have given teachings for 45 years all over northern India to guide people out of suffering. At the age of 82, he died, starkly demonstrating the impermanence of the body. The physical death of the Awakened One was his final teaching: that all living beings are subject to disintegration.

Impermanence, Old Age, and Death

During the many years that he taught, the Buddha often returned to the themes of impermanence, old age, and death. He recommended contemplation at charnel grounds as a way to gain realization of these realities of life. Seeing the corpses of the dead leads to insight and renunciation. Bodies that were once lovely and vibrant are now bloated and grotesque. Everything that comes into being eventually disintegrates, be it molecules or entire world systems. Contemplation on the inevitability of death is a reminder of the fleeting nature of life and the limited time we each have left for achieving liberation from perpetual cycles of death and rebirth. It serves as an incentive to renounce frivolous worldly activities and strive to cultivate wholesome actions of body, speech, and mind. Reflecting on the reality that death is inescapable

impels us to pay close attention to things "as they really are" and not get lulled into destructive, escapist, or meaningless activities. Coupled with an understanding of *karma* ("actions," the law of cause and effect) and rebirth, reflection on death engenders insight into the illusory, transient nature of sense pleasures. Recollecting that death is certain but the time of death is uncertain became a central theme of Buddhist meditation.

The Buddha's teachings on death and impermanence are reminders of the brevity of the human life span and the value of living a meaningful life to create the conditions for liberation. No matter how rich, famous, or accomplished a person may be, death is the inevitable conclusion of life. A realization that death is unavoidable is especially significant within the framework of rebirth, a widespread South Asian belief. In this framework, sentient beings do not live just once, but take rebirth in a variety of life forms, in accordance with their own actions (*karma*). Throughout many lifetimes—as a god, demi-god, human being, animal, hungry ghost, and hell being—they experience numerous sufferings and dissatisfactions in seemingly endless cycles of birth and death (*samsara*). Rebirth in the human realm is regarded as a precious opportunity. In contrast to other states of existence, human beings experience both pleasure and pain and have the intelligence to understand that these experiences are the consequences of actions they created in previous lifetimes. Human beings are uniquely capable of understanding the transience of their lives and the benefit of using life wisely for mental cultivation. A realization of the nature of death and impermanence is therefore critical for inspiring the impulse and determination to freeing oneself from repeated suffering and rebirth. The goal of the Buddhist path and the purpose of life is to become free from the cycle of birth, death, and rebirth and achieve the state of liberation (*nirvana*), or "deathlessness."

The Nature and Process of Dying

Although death comes to plant life and all compounded phenomena, Buddhists focus their attention on sentient beings, that is, beings with consciousness. Consciousness is distinguished from matter and is also subject to the law of cause and effect. Consciousness is impermanent by nature, arising and perishing from moment to moment. Each sentient being possesses an individuated stream of consciousness that continues from beginningless time until the moment of awakening. Through meditation and various methods of mental cultivation, it is believed that sentient beings are able to purify their mindstreams of afflictive emotions (*klesa*s) such as greed, hatred, and ignorance. The root afflictions spawn a host of other mental defilements and conflicting emotions, such as pride, jealousy, fear, and attachment, which give rise to unskillful actions. By extinguishing the mental afflictions, the root causes of unwholesome actions, such as killing, stealing, lying, and sexual misconduct, are eliminated and a state of mental clarity or awakening is achieved. When one is able to purify the mind of mental afflictions, there is no longer any impulse to create unwholesome actions and, by not adding more fuel to the flames, it becomes possible to free oneself from the tedious cycle of rebirth.

Philosophically, Buddhists do not understand death as simply the end point of one lifetime. Death also connotes the disintegration of electrons and constructs and world systems. All compounded phenomena are characterized by impermanence (*anitya*), arising and perishing from moment to moment. Even things that appear to be solid are, upon closer examination, composed of ever-changing particles. Human life is fleeting in the sense that all human beings will eventually die, but also in the sense that the cells of their bodies are in a constant state of change, with their constituent elements continuously coming into being and disintegrating. It can be argued that human beings begin dying from the moment they are born, with the cells of their bodies and the thoughts in their minds undergoing a series of emergences and small deaths all along the way. From this perspective, the human organism is subject to continual evolution and disintegration from the start of a lifetime and continues to decompose until the end. Insight into the workings of this process acts as an incentive to achieve liberation and thereby fulfill the purpose of human life.

The disintegration of the body into its natural elements is just one aspect of the experience of dying, however. Buddhists also seek to understand death from a psychological perspective. For example, fear, denial, and many other anxieties are said

to be aroused by the thought of one's own demise or disappearance. Based on the misconception that there exists some inherent or enduring essence to our self, we cling to our possessions, loved ones, identities, and life itself. The stronger our attachment to this misconception, the more stress and misery we experience when things fall apart. The mistake is in impossibly assuming that things will stay the same. This is not a moral flaw, but simply ignorance. The wisdom that recognizes the impermanence of all things not only accords with our own experience but also serves as a coping mechanism, enabling us to deal with disappointment and loss, including the ultimate loss that occurs at death. By developing the wisdom that understands impermanence, the mind becomes free of clinging to illusions of permanence and clinging to the self. For most Buddhists, ensuring the quality of countless future lives is valued over the pleasures of this single, brief life.

Preparing for the Experience of Dying

Because there is no predicting the time of death, Buddhists believe that it is crucial to prepare for the experience of dying beforehand and not leave things to chance. Living a kind and ethical life and developing insight into death and impermanence are essential for ensuring that a person dies peacefully without regrets. Mental cultivation is prerequisite, because even living a good life and understanding the reality of death intellectually does not ensure that a person will be able to handle the experience of dying well. During a life review, unpleasant memories may surface that arouse intense emotions and distress that may act as obstacles to a smooth transition. Because the last moment of death gives rise to the moment thereafter, it is vitally important for a person to remain calm and mindful during the dying process. At this critical juncture, no distractions or disturbances by loved ones or medical staff should be allowed to hinder the person's passage to the next life. At that point, a highly trained practitioner may even be able to achieve liberation from cyclic existence (*samsara*), but the majority of Buddhists are concerned simply to avoid taking rebirth in an unfortunate state. Buddhist practice is regarded as the best means to ensure a positive outcome.

From a Buddhist perspective, the moment of death is arguably the most important moment of an ordinary person's lifetime. Because the final moment of consciousness in this life serves as the proximate cause of the next moment of consciousness after the death of the body, turbulent emotions such as fear, regret, and anger and negative mental impulses are thought to propel a being to an unpleasant state of rebirth. By contrast, the ability to maintain a calm and peaceful state of mind, free from ill will, desire, or other disturbing emotions, will help ensure a pleasant state of rebirth. The moment of death is therefore of critical importance. By practicing mindfulness in everyday living and cultivating wisdom and compassion throughout one's life, one becomes more adept at the skills needed to prepare for a peaceful transition. Through the process of mental cultivation, one awakens to a new, unencumbered state of consciousness or direct awareness. As an ancient adage puts it, Buddhist practice helps one sleep well and die without regrets.

All Buddhist schools agree that the elements of the physical body disintegrate at death, but interpretations of the transition of consciousness from one lifetime to another may differ. There is no belief in a soul or permanent self that migrates from life to life, so Buddhists need to provide some other explanation for the mechanics of rebirth. Given that the process of rebirth is intangible, it is typically explained by way of an analogy: One candle flame lights a second candle, yet nothing substantial passes between them. For this reason, Buddhists prefer to speak of "rebirth" or "reexistence" rather than "reincarnation." Some texts describe the momentary nature of consciousness and how each moment of consciousness gives rise to the next, from moment to moment, and from one lifetime or state of existence to the next.

Differences of opinion exist among Buddhists concerning the nature and duration of the process of rebirth. Some Buddhists, such as followers of the Theravada and Zen traditions, typically accept that rebirth (or, properly speaking, reconception) occurs immediately after death. Others, such as followers of the Tibetan tradition, believe that there may be an interval between the moment of death in one lifetime and the first moment of life in the next. In the case of a sudden accident, Tibetans believe that rebirth may occur immediately.

Ordinarily, however, there is an intermediate state between the moment of death in one lifetime and the moment of conception in the next life. Tibetan texts present detailed descriptions of this intermediate state, which is known as the *bardo*. According to such texts as the so-called *Tibetan Book of the Dead,* the incipient being (*gandharva*) has an opportunity to assume a new form every 7 days. By the end of a 49-day period, it necessarily "descends" into a new state of existence. The influence of this tradition is reflected in funeral rituals throughout East Asia and Vietnam, where meritorious activities are held every 7 days on behalf of the deceased, with a final service held on the 49th day.

All Buddhist practices are useful for cultivating the mind, but certain practices focus specifically on death. The practice of meditating in cemeteries and cremation grounds is recommended for helping cut through attachment to the body. The practice of meditating on one's own death helps cultivate a sense of urgency for one's practice. In many Thai Buddhist monasteries, a skeleton hung at the entrance serves as a reminder. Another practice is to contemplate that death is certain, but the time of death is uncertain, and at the time of death only one's spiritual practice will be of any benefit. Contemplating the inevitability of death engenders an awareness that no living being escapes the ultimate sentence. Contemplating that the time of death is uncertain awakens the realization that death can come at any time, whether a person is young or old. Contemplating the importance of spiritual practice at the time of death means recognizing that wealth, power, and worldly achievements are utterly useless at this critical juncture. Family and friends, although they ordinarily may be sources of comfort, may even be distractions or attachments that impede a smooth transition to the next life. Another useful practice is Tibetan meditation that leads one through the stages of the dying process and beyond.

Ultimately, all forms of Buddhist practice are regarded as beneficial ways to prepare for dying. Meditation practices such as single-pointed concentration (*samadhi*), calm abiding (*samatha*), and insight (*vipasyana*) are especially useful for maintaining mindfulness at the time of death. Meditations to develop patience act as antidotes to anger and frustration that may arise at the time of death and lead to an unfortunate rebirth. Meditations on loving kindness and compassion help ward off feelings of ill will or resentment and nurture a calm and peaceful state of mind. The practice of generosity—giving away all of one's earthly possessions—is likewise meritorious and helps reduce attachments that might bind one to this world. The recitation of *sutra*s, *mantra*s, and prayers is thought to accumulate merit that will be beneficial for maintaining equanimity and achieving an advantageous rebirth.

Dying in Buddhist Cultures

Buddhists in various cultures have developed a variety of practices that not only help them prepare for death and facilitate the dying process, but also help survivors cope with grief at the loss of a loved one. At funerals in Theravada Buddhist societies, for example, a verse from the *Aniccagatha* is recited to remind mourners that all conditioned things are subject to change, that their nature is to arise and perish, and that everything that arises will eventually cease, resulting in peace. In Burma and Bangladesh, a subsequent verse is a reminder that all beings of the past, present, and future are subject to death, including oneself. Another well-known verse is used to contemplate that nobody knows how long their life will be, what diseases they will contract, where they will die ("whether on land or at sea"), when they will die ("whether during the day or at night"), or where they will be born after death. Buddhists in the Tibetan cultural sphere recite Mahayana texts such as the *Heart of Wisdom Sutra* and perform rituals derived from the tantric tradition.

Funerary practices and attitudes toward death in Buddhist societies may reflect pre-Buddhist cultural influences. In the *bhasi* blessing ritual in Southeast Asian Buddhist countries, for example, strings are tied to mourners' wrists to help keep their multiple souls together, despite the Buddhist teaching on no-soul (*anatman*). In East Asian Buddhist societies, prayers are directed to Buddha Amitabha, who is believed to transport sincere devotees to his Sukhavati Pure Land, where enlightenment can be effortlessly achieved. This practice helps dying patients approach the end of life in a peaceful state of mind and also helps caregivers deal with the stresses of patient care and bereavement. Groups of Amitabha devotees visit the homes and hospital rooms of terminally ill patients

and chant the name of Amitabha around the clock. Devotees find meaning in reciting the name of Amitabha repeatedly during their lifetimes, but it is widely acknowledged that the real benefits of the practice accrue at death. In East Asia, Buddhist understandings of death and practices for commemorating the dead often incorporate other cultural influences, such as the Confucian practice of ancestor veneration. Buddhist temples in China, Korea, Taiwan, and Vietnam usually set aside a shrine room for memorial tablets where prayers are offered and the merit dedicated to the memory of deceased relations.

Tibetan Buddhists have preserved several unique practices related to death. The first is meditation upon one's own death, with specific contemplations at each stage of the dying process. The practitioner first reflects on the dissolution of the five elements (earth, water, fire, air, and ether) and five constituents of the person (body, feelings, recognitions, karmic formations, and consciousness) in sequence, then concentrates on the successively more subtle stages of the dissolution of consciousness. After dispassionately observing these stages of dissolution, one becomes aware of the "clear light of death." If one is able to realize the emptiness of this intensely bright light as being identical to the empty nature of one's own mind, it is possible to achieve perfect enlightenment at that moment. In another meditation practice called *phowa,* one directs the 72,000 winds of the body into the central psychic channel and consciously ejects them through the crown *chakra* to effect rebirth in the Pure Land of Amitabha. Once death occurs and a religious specialist ascertains that the consciousness of the deceased has left the body, the physical remains of the discarded corpse may be offered to birds and wild animals as a final virtuous act of generosity that is known as "sky burial."

Death as Opportunity

In the Buddhist worldview, death is not only inevitable, it is also a great opportunity. A dying person may achieve many realizations—of suffering (*dukkha*), impermanence (*anitya*), and the absence of an enduring self (*anatman*). Awareness of the sufferings of death may engender genuine compassion for the sufferings of others. Reflection on the ephemeral nature of living beings may stimulate the development of wisdom into the true, self-less nature of phenomena. Reflection on the kindness of others may engender feelings of loving kindness for all sentient beings. In these ways, instead of unpleasant feelings of regret, resentment, or helplessness, a person may transform the process of dying from a deeply painful and disturbing experience into a profoundly meaningful opportunity.

Buddhists also regard death as a meaningful opportunity for medical professionals, hospice personnel, and caregivers to gain a deeper understanding of the human condition by mindfully and respectfully caring for the dying. Not only can they develop insight into suffering, impermanence, and no-self, but they also have the opportunity to practice patience and loving kindness. Buddhists generally view palliative care favorably and the premature termination of life unfavorably. It is desirable to ease the suffering of terminally ill patients through all appropriate means, including medication for pain management, as long as these methods do not endanger the life of the patient. Developing the skills to skillfully alleviate physical, psychological, and spiritual pain is viewed as a rare opportunity to practice wisdom and compassion.

Buddhism and Bioethical Decision Making

Given the diversity of attitudes and cultural practices among the world's hundreds of millions of Buddhists, it is impossible to make definitive statements on bioethical issues. The Buddha had no access to modern medical technologies, and there are no universally recognized institutions to deliver position papers on the complex issues these technologies have spawned. The touchstone of Buddhist ethical reflection is to refrain from taking the life of any sentient being, especially a human being, and to refrain from harming that being in any way. Ethical decision making at the end of life is guided by these fundamental principles, based on *karma* and compassion (the wish to free all beings from suffering). For these reasons, although no rules are inviolable and decision making is ultimately the responsibility of individuals, it is believed that abortion, suicide, euthanasia, and assisted suicide are best avoided. In writing a living will or advance health care directive, there is no moral fault in refusing artificial

life support and dying a natural death. Taking someone off life support once it has begun is a more complicated issue. The merits of advanced technologies will be weighed differently by Buddhists throughout the world, whether in Japan, Mongolia, Laos, or Los Angeles, but decision making will be guided by a core of common ethical principles and similar understandings of life and death.

Burial, Paleolithic

The limited nature of the evidence from the Paleolithic, or Old Stone Age, a period beginning over 2.5 million years ago, poses a challenge to archaeologists. Funerary deposits seem to have been limited to cave sites; however, this may indicate more about how artifacts and ancient deposits survive than it does about the limits of cultural practice. During this period there were a number of destructive geoclimatic events, including ice ages, which may account for the absence of evidence since individual hominid species and early human populations may have numbered in the tens of thousands, not tens of millions. Cave sites may have survived continental ice sheets as they were sheltered, just as deeply buried deposits may have survived but are difficult to identify and more difficult still to excavate. Despite the limited and fragmentary nature of the archaeological record, it is evident that it is the Paleolithic that demonstrates first the emergence of human culture and a growing awareness, or at least representation, of human mortality.

Archaeologists have divided the Paleolithic into three phases: the Lower, Middle, and Upper Paleolithic. The Lower Paleolithic is the period from around 2.5 million to about 100,000 years ago and is characterized by the emergence of the *Homo* genus and the development of stone tools. The Middle Paleolithic is roughly the period 300,000 to 30,000 years ago, although there are regional variations in this dating. This middle period is characterized by the emergence of modern man, *Homo sapiens,* between 130,000 and 200,000 years ago. *Homo neanderthalensis* occupied most of Europe during the Middle Paleolithic, and there is debate about the nature of the interaction between these two species. The Upper Paleolithic is often considered to start around 40,000 to 30,000 and have lasted to about 10,000 years ago. It is a period characterized by the survival of more significant numbers of cultural artifacts and art, such as cave painting, campsites, and Venus figurines, as well as advances in the technology of flint tools seen in the utilization of blades rather than choppers or flakes, which may have had a specific function. Bone and antler artifacts such as harpoons also survive.

Lower Paleolithic

There is no evidence for a burial tradition in the Lower Paleolithic, but it is important to understand the development of humans as part of the development of a cultural or social awareness. The early hominids of this period had a more sophisticated social structure than chimpanzees, had larger brains, and made more elaborate stone tools. They seem to have developed a society

based on hunting and gathering and used stone tool technology based on flint choppers made from large pebbles. Little evidence from this period survives and that which does often consists of small collections of bones, collection of flint, or, very rarely, kill sites where stone tools and animal bones coexist in the same space.

Two possibly anthropomorphic figures may be associated with the Lower Paleolithic. The Venus of *Tan-Tan,* found in Morocco, is a small quartz object that might have represented a genderless figure and may have been painted in red ochre. The Venus of *Berekhat Ram,* Golan Heights, is a red stone object that, like the Venus of *Tan Tan*, seems to have been manipulated to resemble a human form. Much controversy surrounds both objects and the intentionality of their crude anthropomorphic shapes; however, they do seem to be altered by hominid hands and both date to over 250,000 years ago.

Although no constructed funerary deposits have been identified, artifact manipulation beyond simple tool manufacture and possibly bodily or spiritual representation start to emerge at the end of the Lower Paleolithic. However, a question remains about the exact nature of funerary treatment. A high proportion of later Lower Paleolithic skeletal remains exhibit signs of cut marks. Around 80 fossils from the cave of Gran Dolina, Atapuerca, had cut marks, and long bones had been split like the other animals. Both the sites of Bilzingsleben, Germany, and Bodo, Ethiopia, revealed *Homo* genus skeletal remains with cut marks across bones and the skull. If this is evidence of cannibalism, it is important to consider if this is a ritual treatment or prey-related cannibalism—food or funeral. Either way, it is a form of recognizable postmortem bodily treatment.

Middle Paleolithic

Greater amounts of material culture survive from the Middle Paleolithic, and there is indisputable evidence for intentional artistic behavior. Stone tools become smaller and may have been fit for specific purposes carried in kits or combinations. Both *Homo sapiens* and *Homo neanderthalensis* seem to exhibit evidence of postmortem bodily treatment. Like archaic *Homo sapiens, Homo neanderthalensis* seems to have been capable of basic verbal communication and used complex flint, bone, and other tools as part of kits. However, when it comes to funerary treatment, there seems to be some question about whether this hominid could have practiced its own form of burial ritual, thus demonstrating what has been regarded as a very human awareness of personal morality or whether it was simply copying early human behavior. Two of the most famous sites are those of La Chapelle-aux-Saints and Le Moustier, both in France. Moustier revealed a fully articulated skeleton buried crouched "as if asleep," and at La Chapelle-aux Saints, a similarly interred individual with articulated cow bones placed above the corpse was found. Perhaps the most striking inhumation is that of the Iraqi, Shanidar 4, grave. An adult male Neanderthal age between 30 and 40 had been placed in a fetal position. From on top of the skeleton, soil samples revealed evidence of ancient pollen. Yarrow, cornflower, bachelor's button, St. Barnaby's thistle, ragwort, grape hyacinth, joint pine, and hollyhock were identified—all plants with some medicinal properties. In the minimalistic interpretations of the late 1980s, scholars argued that all of the cases of Neanderthal burial could be put down to accident survival, simply crawling into a confined space to die. However, this failed to account for the intentionally cut graves and the deliberately medicinal nature of the floral assemblage found at Shanidar, one unlikely to have formed simply though the action of animals or the wind.

Modern human burial in the Middle Paleolithic is not dissimilar to that of the Neanderthals, and the inhumations at the cave site of Mugharet es-Skhul, Israel, contained the remains of four individuals purposefully arranged with flexed limbs. Inhumation 5 was interred with the jaw of a wild boar; inhumation 11 included the skull of a cow. Burials at Qafzeh, Israel, contain the remains of a fallow deer. It is the position of the burials that most clearly indicates human intervention. The Middle Paleolithic yields the placement of supine, crouched, and prone burials. However, the question is not just about bodily placement but also alteration, and there are a number of examples where the body was purposefully taken apart: at the spine as at Roc de Marsal, France, or buried with skull and body separated as at La Ferrassie, France. Despite the evidence of individual graves,

it is the whole assemblage that is most convincing when considering the intentional nature of burial in this ancient period. Both Neanderthals and anatomically modern humans demonstrate significant regional-, age-, and sex-related differentiation in their burial practice. Grave goods are fewer than in the Upper Paleolithic and consist of animal bones, flint points and scrapers, and occasionally shells or other stone objects.

Upper Paleolithic

With the burials from the last 30,000 years of this 2.5-million-year period, there can be no doubt that the humans of the Paleolithic recognized and responded to death. Upper Paleolithic burials were not only deliberate, they were accompanied by sophisticated material and culturally important remains. Perhaps the best preserved of these burials is from the site of Sunghir, near Moscow, where the burial of an adult male was identified along with thousands of ivory beads. Also at Sunghir was a double burial of two juveniles (one male, one female) who were buried with more than 10,000 ivory beads, mammoth ivory pins, discs and pendants, a belt of fox teeth, antler batons, a polished human femur containing red ochre, and a large ivory lance made from a straightened mammoth tusk. In another extraordinary burial site at Dolní Věstonice, Czech Republic, a woman was placed between two males; they all had red ochre on their heads and her groin. They were accompanied by tooth pendants, ivory beads, and shells. Another typical burial from this period is the red lady of Paviland Cave, Wales, where a skeleton (later identified as a man) discovered in a shallow grave showed extensive red ochre staining on the body and surrounding surface, along with pieces of jewelry made from mammoth ivory, sea shells, and a mammoth skull, which has been lost since the first excavation.

Burials from the Upper Paleolithic are more common than earlier ones, and some 50 remains exist from Italy alone. These burials have been identified as coming from two distinct phases of activity. During the first phase, most of the remains are of adult or juvenile males, some ochre was always found, and stones were often part of the structure of the grave. Bone and stone objects were usually present in the burial and were always positioned along the axis of the cave. In the second phase, ochre was found much less frequently as were grave goods; stones were not utilized in the structure of the cut; burials were found in a transverse position to the cave; and women and children were also identified. Upper Paleolithic burial practice shows elements of similarity across the Old World, but this should not be seen as a uniform tradition. Regional variations, as well as chronological transformations, were part of this burial practice just as they are in the material remains of an emerging cultural identity; indeed, by the end of the Paleolithic it is even possible that ethnically distinct groups had emerged.

Conclusion

In summary Paleolithic burial practice is evident, especially from the later part of the period. There is evidence of postmortem treatment in the Lower Paleolithic, but it is not clear if this was truly the beginnings of a funeral tradition. Modern Western attitudes may have difficulty seeing cannibalism on its own as an indication of an awareness of personal mortality. However, animals such as elephants are aware of each other's deaths, so possibly researchers are simply approaching the problems of mortuary awareness in the wrong way. The first evidence of a recognizable cultural expression of mortality appears in the Middle Paleolithic, and both anatomically modern man and Neanderthals were found in graves and caves and show a distinct amount of variation across gender and age. This suggests that these are deliberate, structured deposits even though it is not until the Upper Paleolithic that a large amount of recognizable material culture is identified in graves and regional, cultural, and possibly personal identities are evident in the burial tradition. Humans may have been aware of their own mortality for a million years but it is only in the last 50,000 to 100,000 years that they have chosen to express it in a culturally distinct form that survives in the archaeological record. The later burial assemblages are sometimes found accompanied by fragments of human remains, sometimes adopted or altered for specific uses. These objects might suggest that a tradition of disturbing the dead and incorporating the remains of the

deceased into the lives of the living may have been a more widespread tradition than burial practice and wider than can be witnessed in archaeological deposits.

Burial at Sea

The broad definition of burial at sea encompasses deposition of the corpse in all bodies of water, including not only the sea but also rivers, lakes, and even small ponds. Water burial has been employed by numerous cultures over time, sometimes as a deliberate choice for the disposal of the dead and other times purely out of necessity. Although the rituals employed in burying a body in the water often mimic those on land, there are important differences due to the nature of the aquatic environment. This entry examines the need for proper burial rites at sea, discusses the wide divergence in cross-cultural attitudes toward water inhumation, explores the burial at sea service as a ritual of separation, and notes modern trends in disposing of bodies at sea.

The Need for Proper Burial

Despite the fact that many societies have employed water burial throughout history, cross-cultural comparison indicates that humans are wary of burial at sea unless the proper rites can be performed. Among the Tikopia of the South Pacific, for example, Firth recorded the belief that those who were lost at sea—and thus did not receive a proper funeral—would return to haunt their families, causing sickness or even death. In Tikopia society, religious specialists had the crucial job of contacting lost spirits to find out what had happened to them and where their bodies rested. Armed with this knowledge, the family could then perform a funeral and lay the spirit to rest. This belief is strikingly similar to Western mariners from the Age of Sail, whose stories and songs are replete with the spirits of those who died at sea. Although these ghosts, unlike those of the Tikopia, sometimes aided vessels instead of causing harm, mariners always feared them. The spirits of those buried in the water, like those who die unnatural or untimely deaths on land, are widely held to return unless proper burial rites are performed.

Attitudes Toward Water Burial

Cross-culturally, attitudes toward water inhumation vary from acceptable to undesirable. Some cultures view water as the proper place for the dead, whereas others see it only as a place of last resort or as the place to dispose of criminals or other social outcasts. The former attitude is probably best exemplified by the Hindu belief that the river Ganges is a sacred place that will take the dead to heaven. At the other end of the spectrum lies the idea of water as a convenient place for the elimination of unwanted items. Throughout history, humans have viewed water as a place to dispose of things that are no longer wanted or needed, including corpses. Lindenlauf's research, for example, highlights the similarity between the attitude of the ancient Greeks and modern garbage disposal practices. In both cases, water is seen as a "place of no return" in which unwanted things could be safely discarded.

In keeping with the idea of water as a place for the disposal of refuse, many societies have viewed the sea as the proper place to deposit the bodies of

those who are tainted in some way. The Andaman Islanders, for example, were known to throw the bodies of strangers or enemies into the sea with no burial rites whatsoever. Krause observed that the Tlingit peoples of Alaska did the same with slaves. In both of these cases, disposing of humans in this manner was not thought to generate restless spirits in the way described earlier. This seems to be because strangers, enemies, and slaves were not accorded status as members of the group. They were, in essence, not human. The "bog bodies," of prehistoric northern Europe, which exhibit signs of trauma and were often bound, may also be the bodies of criminals, enemies, or slaves disposed of in the water in a manner comparable to that practiced by the Andaman Islanders and Tlingit.

A similar practice held sway among the Chuuk culture of Truk, who consigned the corpses of infants who died in childbirth to the sea without funeral rites. To the Chuuk, this was acceptable because the infants had not yet become people. The Chuuk did the same thing to members of families who did not own land. When such people died, their bodies were simply thrown into the sea as well. In all of these cases, the key point is that the individuals concerned were not considered to be actual human beings. Thus, it was seen as appropriate to dispose of their corpses in water with no funeral ceremonies.

A similar idea occurs in some cultures that practice secondary burial. In some cases, the body is buried in the ground long enough for it to begin decomposing, then exhumed and the remaining flesh removed from the bones. The bones are cleaned and either given another funeral or retained for various ritual purposes. The decomposing flesh, however, is typically discarded without ceremony. Among cultures that practice water burial, such flesh is often simply cast into the sea. Like the bodies of enemies and slaves, the sea is seen as a proper place to deposit these parts that are not considered important and are no longer wanted.

During the Age of Sail, western seafarers held both positive and negative views toward burial at sea. On the one hand, the sea was seen as the proper resting place for sailors, because it was home to them in the same way that the land was home to farmers. This attitude may, however, have been a reaction to the necessity of sea burial rather than a full acceptance of it. Before the advent of embalming or refrigeration in the 19th century, it was not possible to keep cadavers aboard ship for long, and therefore most of those who died at sea were forced to be buried in it out of necessity. Although sailors came to view this as accepted practice, they were never entirely comfortable with it. This is shown by the fact that bodies were buried ashore if at all possible. When far out to sea, however, land burial was not an option, so sailors devised a burial rite to ensure the dead of a proper funeral.

Burial at Sea as a Ritual of Separation

Like all burial rites, deposition in water takes the form of a ritual of separation in which the deceased is symbolically removed from the world of the living and placed in the realm of the dead. It is important that rituals such as funerals be performed correctly; otherwise they will not have the desired effect. In the case of funerals, improper performance of the ritual means that the dead will not rest. Instead, they will return to haunt the living as ghosts, vampires, or other revenants. On land, funeral rites follow set patterns, and any deviation from accepted practice is seen as dangerous because it may lead to the return of the dead. During the Age of Sail, American and European seafarers adapted the funeral service used on land to shipboard.

However, one of the major problems with burying bodies at sea was that it was not possible to perform the ritual in the same way as was done on land. In particular, two critical elements were missing at sea. First, land funerals began with a procession from the deceased's house to the cemetery. This was more than just a formality. The journey, which was often done by a meandering route and involved numerous stops for prayer and songs, was meant to keep the dead spirit from being able to return and haunt its former home. Aboard ship, no funeral procession could be performed, so the spirit could not be separated far from the living.

The second major problem at sea involved sealing the dead inside the grave. On land, the earth shoveled into the grave provided both a symbolic and a real barrier between the living and the dead. In addition to providing a medium in which the corpse would be contained and deteriorate, earth shoveled onto the coffin also provided a symbolic barrier against the return of the deceased's spirit. Water, on the other hand, is fluid and thus provides

no secure barrier. Weights were employed to ensure that bodies dropped overboard would sink, but sailors had no way of knowing exactly where the corpse had come to rest. Moreover, a corpse resting on the seabed was not as trapped by a layer of earth as was one buried in a grave. Sailors were familiar with the way that the sea cast objects up on shore that had been deposited in its depths and knew that this could happen to the bodies of those buried at sea as well. Because of this, they seem never to have trusted the sea to keep the bodies of the dead that were buried in it. Instead, maritime literature from the Age of Sail reveals that sailors were always uneasy about those who had been buried at sea. Such dead frequently appear as ghosts in seafaring stories and songs. While many of these are no doubt fictional rather than factual, they reveal the uncertainty concerning water burial that existed in the minds of those who composed them.

Modern Burial at Sea

Modern burial at sea has changed much from the traditional model of a land-style funeral service transplanted aboard ship. Instead of burial at sea being almost exclusively a province of sailors, increasing numbers of people now view it as an attractive alternative to crowded cemeteries on land. In Western nations such as the United Kingdom and the United States, cremation is a popular alternative to burial, and the deceased's ashes are often scattered in a place that had meaning to the deceased or his or her family. Those with a connection to the sea often choose the water as the fitting place to scatter their loved one's ashes. Others who may not necessarily have had a connection to the sea during life are coming to view it as an ecologically friendly burial alternative. At least one company now offers a service whereby the ashes are incorporated into artificial reefs. This, like other forms of "green burial," reflects a modern ideal to be environmentally conscious and uses the burial as a way to help the environment.

Conclusions

Burial at sea has been practiced for thousands of years, in forms as diverse as the cultures that have used it. Several prominent trends emerge from a study of burial at sea. First, some cultures view burial in the water as undesirable and often restrict its use to those who are seen as outsiders or undesirables, such as enemies or slaves. Among seafarers, burial at sea came into use out of necessity: Sailors had to have some means to dispose of those who died aboard ship. Their solution was to adapt land-based funeral rites to the aquatic environment, but such attempts were never entirely satisfactory. In recent years, burial at sea has gone from being something done out of necessity to being seen as a desirable practice to promote responsible environmentalism. No doubt forms of burial at sea will continue to change over time to reflect changing views of humanity's relationship with the sea.

Burial Insurance

Burial insurance is a whole life insurance policy with a cash death benefit that can be used to pay

for expenses. Such expenses include burial plot, casket or urn, cremation, embalming, digging the grave, hearse, and grave marker. In the past, insurance premiums as low as 25 to 50 cents were popular among working-class American blue-collar workers and blacks, who held small amounts of disability and burial insurance and paid the premiums weekly or monthly through a funeral home or directly to an insurance agent (debit man) who collected premiums from policyholders at their place of employment or their home. In this area, many black Americans in the past were similar to the contemporary French and British, who tend to purchase small amounts of insurance for burial purposes. Low-cost burial insurance at $2 or $3 a week continues to be a significant investment for many low-income families and, more recently, the elderly.

Burial insurance is the final expense insurance, an expense that many people desire not to burden others with. Thus, burial insurance is a highly desired commodity in that it offers what some refer to as "peace of mind insurance," especially among older individuals. In the southern portion of the United States, older blacks held burial insurance in high esteem, with a sense of security and pride, because to have this form of insurance was to ensure the financial costs incurred at the time of death would not be passed on to others.

Burial insurance costs range from as low as $250 to more than $10,000. Of the five types of life insurance available, burial or funeral insurance is perhaps the most important, especially for low-income families. Burial insurance also is referred to as "pre-need insurance," but these two forms of insurance should not be considered to be the same. Burial insurance is whole life insurance with a death benefit in varying amounts. Pre-need insurance, on the other hand, is a prepayment of funeral arrangements in which all aspects of the process are predetermined and paid for in advance.

The History of Insurance

In 1759, the first American life insurance company was founded, and it was joined in 1770 by its first competitor. By 1800, the number of life insurance companies doubled in size to equal four. Thereafter, the growth of the industry was dynamic, inhibited only during extended periods of economic depression that was cause for the collapse of financial markets.

Burial or industrial insurance was first sold to British factory workers. In 1875, with the founding of the Prudential Friendly Society, burial insurance was introduced into the United States and soon became popular among black families in the Southeast. The American life insurance industry thrived, with sales of life insurance policies to middle-income and labor-intensive lower-income families. From 1927 onward, an industry movement toward professional development held important implications for the door-to-door insurance agent (debit man) who sold small burial policies to low-income families. This was especially true for that majority of agents who, it is stated, held a humanistic orientation toward clients in that they believed the lifeblood of life insurance industry was catering to the needs of families with more modest incomes. Burial insurance represented one of these needs.

Burial Insurance and the Debit Man

A debit is the sum of premiums payable within a stipulated time period (usually a week or month) by policyholders in an agent's geographic area. The term *debit* was frequently used to describe the geographic area and the premiums to be collected from the area's insurance policyholders.

Debit men actively pursued payment of a weekly or monthly debit premium charge for burial insurance and industrial accident insurance. Individual insurance policy debit accounts were carried on the books by insurance companies because many of their clients were low-income workers who often struggled to make these monthly debit payments; the debit man made house calls to encourage payment compliance.

The later entrance of blacks into the insurance arena as owners was prompted by a number of factors. The weekly visits of white agents to the homes of blacks to collect premiums (debits) were generally tolerated until the organization and entry of Negro companies into this field. The insults, abuses, and violations of the privacy of the homes of black policyholders by white agents, especially in the American South, are thought to have facilitated the creation of black-owned industrial life insurance companies.

Growth of a Minority Industry

Black life insurance companies grew out of the church relief societies of the 1787 to 1890 period and the Negro fraternal benevolent burial associations that flourished in the United States from 1865 to 1915. Consistent with the fact that blacks were primarily involved in an industrial labor-intensive marketplace, most of the insurance sold first through benevolent societies and later through black-owned insurance companies covered the areas of health and accident. In reality, this form of industrial insurance was intended to provide modest benefits for the disabled and a decent burial for the deceased.

By 1940 there were 46 Negro life insurance organizations located in 24 states and the District of Columbia. The rapid growth of industrial life and disability insurance among members of the black community can be attributed, in part, to the sensitivity of the black insurer in promptly making payments to claimants.

The importance of some amount of life or burial insurance, no matter how small the policy is worth, has held an attractive lure to almost all segments of the U.S. population. Indeed, it was through the determined efforts of individuals such as the lower-status "debit man," who serviced the needs of these low- to middle-income families, that this substantial portion of a vast industry was created and nurtured. Since 1983 yearly life insurance purchases have exceeded $1 trillion. With more than 21 million burial policies and $16 billion in force at the turn of the 21st century, burial insurance represents an important component of the insurance market.

Burial Laws

Unlike laws regulating the insurance industry, the legal profession, or matters of inheritance, burial laws found in the United States do not possess a common theme or thread of statutory logic. Each is different, and many are silent where others are detailed.

The burial laws first adopted in the United States reflect English common law and/or church rules and regulations governing church cemeteries in Great Britain and those for other European societies. Following such common law doctrine and based on practical experience, these early laws adopted by the various states addressed what needs may have been perceived. As burial laws evolved, state legislatures were, in most cases, reacting to specific and unique issues surrounding municipal, religious, and fraternal cemeteries found within the state. Model statutes to consider during the previous century were nearly nonexistent; thus hybrid legislation resulted.

Today, burial law can be as brief as a passing mention within several sections of state code or as highly detailed as to fill entire chapters of law in which state agencies (e.g., state cemetery boards) are created to regulate such laws. The pattern appears to be no pattern. Other than national cemeteries (veterans' cemeteries) and specific protections offered to Native American and historical burial grounds, very little exists in federal statute regulating cemeteries and burial practices.

The U.S. Geological Survey estimates there could be as many as 200,000 burial grounds in the United States; statistically, there are at least 100,000. The U.S. Geological Survey's estimate includes any and all burial grounds (sites), even those where just one or two burials may exist, for example, a sealed mine shaft with known accident victims who were never removed. Today's burial laws govern cemeteries of record, both active and inactive.

There are four major subjects found within today's burial laws: (1) cemetery land and issues related to such, (2) individual and family burial

rights and the nature thereof, (3) business regulation and exemption from such (i.e., religious organizations), and (4) jurisdictional authorities (i.e., coroners, taxing districts, etc.). With the evolution of the so-called modern cemetery and that of "before need (pre-need)" sales practices, new laws have been developed to protect trust funds and the rights of both the modern cemetery and its consumers.

Cemetery Land Law

Most burial law today recognizes the unique nature of cemetery land as it relates to land use and property taxes. Burial land often is exempt from property taxes and various types of regulatory fees. "Dedication" of cemetery lands for cemetery purposes only protects the continued use of cemetery land from generation to generation. Dedication in most cases is filed with a county or borough recording authority, and to remove such dedication requires extraordinary actions. In many cases, courts of competent jurisdiction are required to concur with dedication removals. Burial laws appear to recognize that changing societal values and needs must be balanced with the established values expressed at the time of dedication. Dedication in many cases can represent promises to consumers that might take a century to fulfill. For example, 100 acres of land is dedicated in 1890 for cemetery purposes. The cemetery in this case is cared for with proceeds from an endowment care fund that derives its capital from deposits made as individual graves are sold. To "fully fund" such an endowment, the fund expects all available space within the dedication to be eventually sold. But later, the operators of the cemetery see greater revenue opportunities in selling unsold grave space for a housing development, a prospect never envisioned 118 years earlier. Burial law that protects dedicated cemetery land addresses the fact that the unfilled sales volume will undercut fulfillment of the care fund, thus damaging society's promises made decades ago to now deceased individuals. Enter the courts or a state agency for competent jurisdiction pursuant to dedication removal procedures.

Burial laws today attempt to, in many cases, address the four different approaches found in the continued maintenance of cemeteries. Given the oversight needed and the nature of the maintaining organization, cemetery burial law can be simple or detailed. Some cemeteries are maintained by volunteer organizations that put together community days during which all interested parties are asked to pitch in with maintenance help. Burial law may address protection of the Good Samaritans helping out from the legal efforts of those who argue their family grave was desecrated by such volunteerism. Church and fraternal orders own and operate many cemeteries, maintaining the property through cemetery sales and the "collection plate" of their organizations. Burial laws often exempt such organizations from taxes and oversight as religious freedom. It is not uncommon to find specific exemptions for religious cemeteries within burial law. Counties, cities, and taxing districts operate cemeteries and do so by authority of specific burial laws. Taxing districts become mini-governments unto themselves, including the creation of cemetery districts, district director elections, and taxing authorities. State burial laws will specifically authorize cities and counties to enter into active cemetery ownership and/or management agreements and, in some cases, to collect property taxes within a defined cemetery district. Most modern cemeteries rely on endowment or perpetual care funds to provide for maintenance. Specific burial laws may exist in the various states regulating how such funds will be invested, managed, used, and accounted for. Burial laws have created state agencies for the single purpose of oversight and audit of such funds. Criminal statutes exist for violation of such burial laws.

Protection for cemeteries from local condemnation and right-of-way actions can be found in various state burial laws. Highways, both state and local, can represent a major threat to the continued characteristics of a cemetery. Burial laws in many states make it most difficult to condemn potential burial space or existing burials for public right of way. It is not uncommon to find, when flying over cemeteries, most unusual detours taken by major highway systems to avoid a cemetery. Burial laws have protected the rights of the dead over society's need to travel in a straight line.

Local land-use ordinances and zoning may vary over a hundred-year period of time, yet the cemetery remains untouched because of the protection that burial laws provide. Unlike most all other entities,

cemeteries are free to plan land use within their dedicated acreage. Under many burial laws, the laying out and removal of cemetery roadways are allowed without local approval of such actions. Such freedom varies considerably from state to state. Burial laws may require municipal or county approval in one state while another state specifically exempts cemeteries from any such local controls.

Environmental, Building, and Construction Codes

Environmental issues and burial law have collided in many communities. Wetlands, waterway setbacks, endangered species, and other contemporary environmental issues have greatly challenged the long-standing practice of exemptions enjoyed by cemeteries under state burial laws. Much remains to be resolved in this venue.

Building and construction codes are still another area wherein local ordinances and zoning regulations have authority to reach beyond state burial law. Whether construction is for burial purposes (e.g., mausoleums and columbaria, or funeral home and maintenance shops), public health and safety law, in most cases, trumps state burial law. Burial laws have been used to exempt cemeteries from payment of sales tax and certain fees to local government for mausoleum and columbarium development costs. It is argued that such is for cemetery burial purposes only and thus exempt.

Burial laws in many states allow for cemeteries to write and enforce their own rules and regulations, including speed limits, right of assembly, memorial design and content, hours of operation, and decorations allowed within the cemetery. Some burial laws even allow the "cemetery authority" to have what equates to police authority in and around the cemetery for the purpose of protecting the cemetery and enforcing its rules and regulations.

Cemetery Abandonment Law

The abandonment of cemeteries is addressed in some state burial laws. An abandoned cemetery located at the corner of a large tract of land may be protected should subdivision or land development proposals aim to eliminate the cemetery. Burial law in some states will allow for an extensive court review regarding a court-supervised relocation of a small cemetery should development threaten. Federal bankruptcy courts have had some success in overcoming state burial laws with relationship to liquidating land. Such actions viewed the rights of existing burials as a first position "creditor" when considering distributions of assets to cover relocation costs. Burial laws have been created to declare abandoned cemeteries as historical sites, thus affording legal protection. Burial laws can protect abandoned graves by establishing a "buffer" of 5 or 10 feet around such graves and by declaring these sites as dedicated cemetery lands.

Burial Law on Individual and Family Rights

Burial law in the United States often will address family and personal rights of burial within cemeteries. Considered by many to be a "right of sepulcher," control of burial space is maintained by families under burial laws even during foreclosures and seizure attempts. Burial law may forbid listing of such burial rights as an asset or using the same for collateral in the areas of finance. Graves under many state burial laws are exempt from seizure in legal disputes involving financial awards. Common within burial law, but not common in method and approach, are provisions for descent of title to unoccupied graves. In some burial laws, even title to occupied graves descends to a varying list of heirs.

The right to control a grave's use can be found in some burial laws. When family disputes arise regarding who might be using one or more graves owned by a now-deceased occupant, burial law will come into play. Cemetery rules and regulations may be the "law of last resort" in such disputes. Divorce, remarriage, and blended families present major issues that burial law may remain silent over.

Title conveyance and resale by families are covered under some burial laws. The questions of what title is and what title consists of often are addressed under burial law. Burial laws may address the issue of quit claim and warranty deeds for cemetery graves and/or burial rights. Burial law often refers to the cemetery as being the recording agency in such transfers of ownership rather than agencies of public record, such as the county courthouse. Generally, lot owners do not hold a fee simple interest in the real estate, but have a type of

easement permitting their use of assigned spaces for the interment of human remains, subject to the regulations of the cemetery.

Disinterment and Desecration Regulations

Burial law and/or public health law address disinterment issues within many states. Just who has standing to order a disinterment and who has the right to object? Burial law often will conflict from state to state on such authority. Must all living children of a deceased parent agree to disinter? What if the disinterment request would result in separating the spouse and/or children of the deceased? What if disinterment is requested for cremation purposes? Burial law can be most specific in such cases or simply refer to the cemetery's rules and regulations.

Society seems to hold great disdain for the desecrator of graves. Burial law in some states imposes severe penalties upon the convicted desecrator of graves, even including prison time. State legislatures have acted with record dispatch to plug loopholes found during cases of grave desecration.

Burial Law on Business Operation

Contemporary burial law may address the "business of cemetery." Some states forbid for-profit organizations from operating within a cemetery, whereas other state burial laws may forbid funeral homes from being built upon the cemetery or from being owned by a cemetery business. Burial law has been so detailed as to restrict the sale of certain types of monuments by cemetery businesses and has restricted certain types of ownership of these businesses. Special exemptions from business regulation may be found in burial law, most commonly with businesses operated by religious organizations. Licensing of cemetery businesses can be addressed specifically in some burial law. During the past half-century burial law in some states has addressed, in detail, funding requirements for businesses that sell, in advance of need, cemetery goods and services. Known as preneed trust laws, such laws can be found under identified burial law codes. Records generated by cemeteries regarding burial locations and detail of arrangements made at the time of burial are protected under some burial laws.

Special Jurisdictional Authorities

Burial law may establish special jurisdictional authority to coroners, prosecutors, and special oversight agencies. Coroners are referenced in burial law as having a specific right to operate and control a cemetery. Still other burial laws will authorize a state agency to seize control of a cemetery for the purposes of protecting existing records and business activities.

Burial laws do vary considerably from state to state. Industry groups such as the International Cemetery, Cremation and Funeral Association have produced model legislation for consideration by states seeking such. The evolution of burial law in the United States has been slow, yet burial laws of the 19th century are notably different from those of the 21st century.

Buried Alive

Burial alive has been used as a form of torture to induce panic and physiological breakdown, and state endorsed and illegal cases have been documented from India, Russia, China, the United States, and Europe. This entry focuses on a much more extraordinary form of live burial: that which occurs as a part of social and cultural practice. Being buried alive is not simply a form of physical disposal; it also serves an important function in facilitating immortality or special deaths. It can be used to immortalize kingship, allowing the surviving family to maintain a special status through kinship bonds with an immortal ancestor. It can also be used to dispose of unwanted children, allowing the parents or relatives to effectively miss the point of death. In cases of sacrifice and regicide, kings, women, and children can transcend death either to avoid repercussions or to achieve immortality. Being buried alive is also feared, and in the 19th century, this fear affected coffin design and the material used to dispose of the dead.

Regicide and Live Burial: The Anthropological Evidence

Among the northern tribes of the Dinka of southern Sudan, there is the memory of regicide. It has been decades or more since a leader has been buried alive; however, when it did take place, it was an important means for the continual legitimization of power by the ruling family. The act of being buried took several days. A large hole was excavated at the highest point within an ancient cattle-campsite. Two wooden platforms were constructed, and for 2 days songs were sung to honor the bulls. Afterwards, and with the family gathered, the bulls were slaughtered, and a bed was made from their hides. While the bed was being constructed, the ritual entered a liminal stage involving feasting and sexual promiscuity. After the bed was completed, war shields were placed on it, the king was interred, and a chamber was constructed within the hole. The chamber was covered with cow dung, but a small hole was left in the surface so the men of the tribe could ask the incumbent for divination until he stopped replying and had finally been taken into the earth. When the chamber collapsed, a shrine was constructed on the site marking the completion of the process of the king passing into the afterlife. This transition was unique to his role as chief, which allowed him not just a special death but to become associated with Dinka ideas of immortality and divinity.

The anthropologists who reported the burial act described in the previous paragraph did not actually witness the act of regicide, and the practice seems to have been outlawed with the advent of British imperial colonization. This has led to controversy surrounding this topic and, as with the study of sacrifice, anthropologists have suggested that the practice of regicidal live burial is symbolic and never actually took place. However, scholars of this topic must be careful not to sanitize alien societies by forcing them to fit with Western attitudes and ideals.

Infanticide, Savage Society, and the 19th-Century Attitude

Before the birth of academic anthropology, colonial administrators and military officers reported on the people in the British Empire. In 1881, the deputy commissioner of Hoshyārpur in the Punjab reported that hundreds of female children were killed annually, buried in a *gharras* or water pots at the end of a ritual designed to bring male children. According to similar sources, if a mother from the Irulas or Nilgiris was driven to hunger, she could bury her child alive in anticipation of its final misery, believing this to be a merciful means of death. Such reports of infanticide were published in London and may have been among the social justifications for colonizing and converting the "savages." It is perhaps notable that many of these cases were never actually witnessed by the colonial officials, generating problems similar to those surrounding cases of regicide. However, that there is a significant favor for male children is witnessed today through the Indian government's need to outlaw ultrasound scans for fears of widespread selective female abortion. It is also worthy of note that in 2007, the Indian media reported the survival of a 2-year-old girl buried alive by her relatives in the Mahbubnagar district. Female infanticide may have been practiced, but probably not on the scale suggested by the colonial officials, who reported whole villages with no female children.

Buried Alive and Human Sacrifice: Archaeological Evidence

Contrary to the view of colonial officials, live burial is a feature of complex societies, and evidence has been found of live burial in some of the earliest city-states. The bodies of slaves, or workers, were left walled up in Egyptian pyramids, buried alive to accompany the dead king into the afterlife. Possibly the most striking case known is from the ancient Mesopotamian city of Ur, located in modern Iraq. Within the cemetery in the middle of this city were the tombs of several members of the royal family identified from the accompanying cylinder seals. The 16 royal tombs consisted of a vault containing the body and treasures; outside of the vault was a ramp providing access to the chamber and a number of antechambers with dozens of retainers buried in full costume and the paraphernalia of their role. There is some debate surrounding how these retainers died, and a small cup found near each skeleton suggests they were poisoned, but these cups may have contained sedatives, drugs, or alcohol. Poison may not have been needed and if a sedative was used, the retainers would have simply died in their sleep, buried alive—such a death could transcend mortality. It is just as likely that these individuals were buried alive within their chambers. This case highlights an interesting problem: It is almost impossible to identify having been buried alive as the cause of death in ancient corpses, and researchers can only speculate how the retainers at Ur actually died.

The most convincing cases come from unique graves. One of these is the burial of a 6th-century Anglo-Saxon woman found within a contemporary cemetery in Sewerby, United Kingdom. In this inhumation, she was found laying face down with arms and legs out and in the appearance of flaying about. At least visually the body of this woman gives the impression of having been buried alive, against her will. A similar case exists from the Iron Age hill fort at Danebury, United Kingdom, where bodies, placed in grain storage pits, seem to have been weighed down by large stones. One of these bodies, like the Sewerby woman, had its arms outstretched and seems to have been buried alive under the stones. These two cases have been interpreted in different ways. The Sewerby woman is regarded as having been murdered, a deviant burial in an otherwise typical cemetery and an indication of some type of special execution, perhaps for witchcraft. In contrast, the Danebury burials have been interpreted as ritual sacrifices linked to a cycle of fertility and rebirth. However, in both of these cases the underlying motivation for the action was not, as it had been in Mesopotamia or among the Dinka, to create an impression of immortality by hiding death. Instead the purpose of live burial has been interpreted as a means to dispel or destroy evil, a bad harvest or hostile magic, or a curse or bad luck.

Fear, Superstition, and Material Culture in the 19th Century

In the cases discussed in this entry, it has been difficult if not impossible to prove that live burial actually took place, and each of these examples are hotly debated. However, the fear of being buried alive does manifest itself within coffin and grave design. In the 19th century this fear was particularly acute, and a large number of safety coffins were designed, particularly during the cholera epidemics. Over 30 different designs were patented in Germany. The first recorded example is that of the Duke Ferdinand of Brunswick's design in 1792; it had a window, a tube for air, and a lock instead of a nailed-down lid. Other designs included ladders, cords, bells, flags, and breathing or feeding tubes. Although there is little evidence to suggest that people actually used these features, glass-paneled coffin lids have been found in England. Two coffins with 6-inch square windows over the head end were discovered from Redearth, a private burial ground in Darwen, Lancashire, United Kingdom. Presumably these widows were too small to allow the incumbent to break the glass and escape, but they were large enough to allow people at the funeral to look into the coffin and determine the condition of the body—live or dead.

The fear of being buried alive was inspired not just by the increased mortality rates of the cholera epidemic but by stories of people who awoke just before burial. Indeed, painters and poets enjoyed the topic, and Edgar Allan Poe wrote *The Premature Burial* in 1844 and returned to the theme repeatedly during his writing career. Such urban legends are still about today, partly inspired by TV culture

and the Internet. As recently as 1995, an Italian manufacturer invented a safety coffin that included an emergency alarm, two-way microphone/speaker, a torch, oxygen tank, and a heartbeat sensor/stimulator. However, as most corpses are drained and embalmed, these seem to be redundant additions to modern coffins.

Torture and Execution

In late medieval France and Germany, women guilty of murder and occasionally those believed to be witches were burned or buried alive. In Germany this burial often involved the inclusion of thorns or being staked to the ground, and it was thought that being buried alive would be much less likely to result in the return of a vengeful revenant than would hanging, which was the usual treatment for men. Indeed, live burial was a punishment in ancient Rome, and vestal virgins transgressing their vow of chastity were reported to have been buried alive. This is a tradition that started before Imperial Rome but survived throughout. Kings instituted the punishment of live burial, but classicists report only a small number of recorded cases occurring when Rome was in political crisis, so these might be better understood as sacrifices. Indeed Pliny the Elder gives accounts of pairs of Gauls and Greeks being buried alive in Rome as human sacrifices at times of great stress.

Conclusion

In summary, live burial can take on an important role in society, but as these examples indicate, this is likely to be specific to certain members of society, such as kings, women, and female children. The act of live burial masks the process of dying and the onset of death. It can be used as a means to transcend death and to create immortal ancestors. A process like this can be important for the surviving family and helps legitimate their roles as an elite regent group. Similarly, ancient society probably practiced live burials, and it is documented in ancient Mesopotamia, ancient Egypt, and Rome. However, anthropological and archaeological debates demonstrate that it is a controversial topic and is unfortunately an area that can be subjected to modern Western sensibilities. Being buried alive has also been feared. In the 19th century, coffin designs were produced that were intended to prevent loved ones from being buried alive, and although these never entered mainstream material culture, glass-fronted coffins have been found in the crypts of the middle classes.

Cancer and Oncology

The American Cancer Society projects that in the United States alone, 1,437,180 people will be diagnosed with cancer and 565,650 will die from the disease in 2008. Accordingly, understanding what cancer is, what factors may contribute to its development, what cancer screenings and treatments are available, and most importantly, how to prevent cancer, are all important topics for consideration.

What Is Cancer?

Cancer is a group of more than 100 different diseases, all characterized by cellular growth and division gone awry. Normally, when the body produces cells, younger cells divide to form the new cells that will replace the old ones as they die off. However, if cells continue to divide, even when new cells are not needed, an extra mass of cells called a tumor can form.

There are two main types of tumors: benign and malignant. Benign tumors are not cancerous and generally do not spread to other body locations. Malignant tumors, on the other hand, are cancerous and may spread from the tumor to other body parts by traveling through the bloodstream or lymphatic system. Cancer that has spread to other body organs is said to have metastasized. Not all forms of cancer develop into malignant tumors, though. Some, like leukemias for example, develop in blood cells.

Malignant tumors and cancers are classified into four major types, the majority of which are carcinomas. Carcinomas are cancers that develop in epithelial cells, which line the surfaces or cover internal organs. Sarcomas develop in bone, cartilage, fat, connective tissue, and muscle; leukemias develop in the blood cells and bone marrow; and lymphomas are cancers that originate in the lymphatic system.

Cancer Incidence and Mortality

Cancer is the second leading cause of death in the United States, accounting for one in four deaths. Among men, the five most commonly diagnosed cancers, excluding skin cancers, are prostate, lung, colon, bladder, and non-Hodgkin's lymphoma. Among women, the five most commonly diagnosed cancers are breast, lung, colorectal, uterine, and non-Hodgkin's lymphoma, in descending order of frequency. The five cancers with the highest mortality rates among men are lung, prostate, colon, pancreatic, and leukemia, respectively. For women, the cancers with the highest mortality rates are lung, breast, colon, pancreatic, and ovarian. Childhood cancers, over half of which are leukemia and brain and nervous system cancers, are the second leading cause of death in children.

Cancer Risk Factors

Over the years, researchers have struggled to answer the question, "What causes cancer?" The two main categories of risk factors that have been

identified are heredity, which is uncontrollable; and environment, or factors that people are exposed to that are often modifiable and controllable. Heredity, or inherited gene mutations, increases one's risk of developing cancer compared to the general population, but it accounts for only about 5% to 10% of cancers. Because environmental risk factors are estimated to account for 75% to 80% of cancer cases and deaths in the United States alone, many studies have focused on identifying risk factors that may increase one's chances of developing cancer.

Tobacco

In 2007, smoking alone was expected to cause 168,000 cancer deaths, and tobacco ranks as the single greatest preventable cause of death in the United States. Smoking and tobacco use increase the risk for at least 15 different types of cancer and are primarily responsible for over 30% of all cancer deaths and roughly 80% to 90% of lung cancer deaths. Additionally, approximately 3,000 nonsmokers die annually from the effects of secondhand smoke.

Obesity

Approximately two thirds of Americans are overweight or obese, and after tobacco, being overweight or obese is the most preventable risk factor for cancer. Unfortunately, the relationship between obesity and cancer is not well known despite the fact that approximately one third of cancer deaths are attributed to poor nutrition, physical inactivity, overweight, and obesity.

Obesity and physical inactivity are associated with colon, liver, pancreatic, esophageal, kidney, gallbladder, endometrial, prostate, and postmenopausal breast cancer. Further, the American Cancer Society reported that being overweight is a risk factor for the development of some lymphomas and leukemias. The risk for developing cancer does not apply simply to those who are clinically obese. One's cancer risk increases steadily as weight increases from normal weight, to overweight, to obese.

Overweight and obesity may to contribute to cancer in several ways. For example, being overweight triggers high estrogen levels, which are associated with both postmenopausal breast and endometrial cancer. High insulin levels, which are affected by obesity, may also play a role in the development of both of those cancers. Gastric reflux, exacerbated by overweight and obesity, is a leading risk factor for the development of esophageal cancer, and colon cancer may, in part, be related to high insulin levels. Finally, obesity can trigger inflammation, which may possibly be associated with several forms of cancer.

Alcohol

Alcohol is an established risk factor for cancer of the mouth, throat, larynx, liver, esophagus, and breast. Although moderate alcohol consumption reduces one's risk for cardiac disease, such is not the case for cancer. In fact, even one alcoholic drink per day can significantly increase breast cancer risk, and colon cancer risk increases with two drinks per day. Mouth, throat, and liver cancer risk increases with over two drinks per day, and the risk is significantly greater among those who both smoke and drink.

Infectious Agents

Infectious agents, including viruses and bacteria, are responsible for 15% of cancers worldwide. The human papillomavirus (HPV) is the primary cause of cervical cancer and is related to some cases of penile and anal cancer; hepatitis B and hepatitis C are major causes of liver cancer. Infection with *Helicobacter pylori*, a bacterium that causes stomach ulcers, increases the risk for stomach cancer and for lymphoma of the stomach lining. Human immunodeficiency virus (HIV) is associated with increased risk for lymphoma and Kaposi's sarcoma, and the Epstein-Barr virus, a common virus that causes mononucleosis, has been linked with Burkitt and immunoblastic lymphomas, as well as nasopharyngeal carcinoma. Human T-cell lymphocytotropic virus is associated with a specific form of T-cell lymphoma.

Environmental Risks

Other known risk factors for cancer include ultraviolet sunlight; cancer-causing chemicals in the workplace; and air, water, and soil pollution, including radon. About 1 in 20 homes has elevated

levels of radon, a naturally occurring radioactive gas, and about 20,000 lung cancer deaths annually are caused by radon exposure in homes.

Another potentially serious risk factor for developing cancer is radiation exposure. Ionizing radiation is invisible, high-frequency radiation that can damage DNA or genes. Everyone is exposed to small doses of ionizing radiation from the earth's atmosphere via cosmic rays, sunlight, soil and rocks in the ground, and other sources, but these levels of radiation only account for a very small percentage of one's total cancer risk. However, some people are exposed to much greater levels of ionizing radiation during certain diagnostic and treatment-oriented medical procedures.

Patients who receive radiation to treat cancer or other conditions may be at increased risk for developing cancer in the future, and X-rays used to diagnose or screen for disease also expose people to ionizing radiation. The dose of radiation from diagnostic and screening procedures is much lower than the dose used to treat a disease, but some diagnostic procedures pose greater risks than others. For example, the radiation dose of a chest X-ray exposes a person to the equivalent effective dose of 2.4 days of naturally occurring background radiation. A computerized axial tomographic (CAT or CT) scan of the abdomen exposes one to the amount of radiation equivalent to 500 chest X-rays and 3.3 years of naturally occurring background radiation. A cardiac CT scan for a woman produces the radiation equivalent of 1,070 chest X-rays and 7.1 years of natural background radiation.

Oncology

Oncology is the branch of medicine that concentrates on the prevention, development, diagnosis, and treatment of cancer; doctors who treat cancer are called oncologists. Medical oncologists treat cancer with chemotherapy; surgical oncologists biopsy, stage, and perform surgery to remove cancerous tumors; and radiation oncologists use radiotherapy, or therapeutic radiation, to treat cancer or to shrink tumors to reduce pain and suffering of patients. Oncologists often first become involved with patient care at the time of cancer diagnosis.

Diagnosis

Correct diagnosis is critical to determining the most effective therapeutic options and patient prognosis. Cancers are diagnosed at different stages of development and these stages are based on the size and location of the tumor or cancer, and whether or not the cancer has spread. One of the two most common methods of staging cancer is the TNM system. "T" relates to the extent of the primary tumor, "N" to regional lymph node involvement, and "M" to distant metastases. Those three factors determine whether the cancer will be diagnosed as Stage I, II, III, or IV. Generally, Stage I cancers are localized and often curable, whereas Stage IV cancers have spread or metastasized to distant locations throughout the body. The prognosis for Stage IV cancers is generally poor.

Treatment

Most cancers can be treated and some can even be cured. The specific treatment protocol utilized will depend on the cancer type and stage, as well as the general condition of the patient and his or her ability to withstand treatment.

Surgery

Surgery is often the first line of defense in cancer treatment and sometimes can successfully remove the entire tumor, particularly in the early stages of disease. Sometimes tumors cannot be completely removed because they are embedded in or attached to an organ, and removal would endanger the patient's life. In that case, surgery may be used to debulk, or remove some of the tumor mass to improve one's quality or length of life. New surgical techniques such as cryosurgery, which freezes tumor cells, and radio frequency ablation, which heats tumor cells and requires only small incisions to insert surgical instruments, result in easier recovery and fewer complications.

Chemotherapy

Chemotherapy is the use of medication to destroy cancer cells and/or shrink tumors. Chemotherapy is used when cancer is located in an area that makes surgery impossible or too risky or when the cancer is not a solid tumor that can be surgically removed,

as in leukemias. Chemotherapy may also be used when surgery has been unable to fully remove all tumor cells or when cancer has metastasized to distant body regions. Finally, chemotherapy may be utilized when surgery appears to have removed all observable cancer, but there is a risk of cell migration; in this case, chemotherapy is used as adjuvant therapy. Chemotherapy is often less noxious than it used to be as a result of drugs that better manage the negative side effects, such as nausea and low white blood cell counts that can cause life-threatening infections and other problems.

Radiation Therapy

Radiation therapy uses high-dosage radiation from X-rays, gamma rays, and other sources of radiation to either destroy cancer cells or shrink tumors. Radiation is often administered by machines that emit external-beam radiation. However, radiation can also be given internally, either by inserting a radioactive source into the body near tumors or cancer cells or by infusing radioactive substances into the body via the bloodstream to target cancerous tissues in the body.

Hospice and Palliative Care

When it becomes clear that treatments are ineffective at slowing the progression of cancer and it has become terminal, treatment may include hospice and palliative care. Hospice care is a multidisciplinary, holistic approach to patient care, usually home-based in the United States, and is provided for persons suffering from terminal illnesses, including incurable cancers. Hospice patients receive palliative care, which is aimed at managing symptoms and providing comfort but not curing one's cancer.

The field of oncology continues to develop more advanced cancer treatments through the process of testing new surgical, chemotherapy, and radiation treatments in clinical trials. A clinical trial is one of the final stages of an extensive research process that tests new treatments that have shown success in laboratory tests. Several promising cancer treatments that are currently being tested in clinical trials, or have recently been approved, include cancer vaccines to treat cancer, gene therapy that tailors treatment to a specific tumor's genes, and targeted therapies that kill cancer cells while preserving healthy cells. The development of these and other cutting-edge cancer treatments is promising, but regardless of how successful cancer treatments become in the future, it is always preferable to prevent the development of cancer in the first place.

Cancer Prevention and Screening

Cancer Prevention

The risk of developing cancer can be significantly reduced by making moderate lifestyle changes. The American Cancer Society as well as the panel that published the 2007 report *Food, Nutrition, Physical Activity, and the Prevention of Cancer: A Global Perspective* have established guidelines on nutrition, physical activity, and other preventive measures. Diet and physical activity guidelines include maintaining a healthy, lean weight; adopting a physically active lifestyle with a minimum of 30 minutes of daily exercise and limited sedentary habits; consuming a plant-based diet, low in red and processed meats, salt, calorie-dense foods, and sugary drinks; and limiting alcohol consumption to one drink per day for women and two per day for men. Vitamins and supplements are not generally recommended for cancer prevention.

Additional recommendations include protecting oneself from excessive sunlight, especially during peak radiation hours; as well as avoiding tanning beds for the prevention of skin cancer. Immunizations for hepatitis B and HPV are recommended, as is avoiding risky sexual behaviors that can contribute to HPV, HIV, and hepatitis B and C, all diseases associated with the development of cancer. Finally, the American Cancer Society recommends regular screening and self-examinations for certain types of cancer.

Screening and Early Detection

People who are diagnosed with cancer at a late stage are at significantly greater risk of dying from their cancer, but recommended screening tests can improve survival by detecting cancer at an early stage when treatment is more effective. Screening may even prevent the development of

some cancers by finding and removing premalignant abnormalities, as in the case of some skin and colon cancers.

Both the American Cancer Society and the Centers for Disease Control and Prevention have presented nationwide objectives and initiatives for early detection of some cancers. Mouth and skin cancers can be identified at early stages by dental and medical examination, respectively, and early detection screening measures such as mammography, colorectal screening, and pap tests have been found to reduce mortality from breast, colon, rectum, and cervical cancers. In many cases, colorectal cancer can actually be prevented because most colorectal cancers develop from precancerous polyps, which can be removed during a colonoscopy screening procedure. It is estimated that half of all deaths from colorectal cancer could be prevented by colorectal screening, yet only two in five Americans over the age of 50 have had colorectal screening.

Although many believe the prostate-specific antigen test and digital rectal exam screening measures have contributed to declining prostate cancer deaths, currently, the American Cancer Society and the Centers for Disease Control and Prevention have not set any formal guidelines for prostate cancer screening. Both groups report that there is currently insufficient evidence to make specific recommendations either for or against prostate cancer screening.

In addition to screening, people should be alert for changes in their body that may indicate cancer. Cancer may cause a wide variety of symptoms, such as unexplained lumps in the body; changes in warts or moles; sores that do not heal; nagging coughs or hoarseness; changes in bowel or bladder habits; unusual vaginal, urinary, or rectal bleeding or discharge; indigestion or difficulty swallowing; unexplained changes in weight; overwhelming fatigue; unexplained anemia; night sweats; and enlarged lymph nodes. This list is fairly extensive and the symptoms often not caused by cancer, but if these or other physical changes persist, medical consultation is recommended. Additionally, because some cancers have no obvious symptoms, routine physical exams are recommended by some authorities.

Controlling risk factors to help prevent the development of cancer can possibly reduce the number of newly diagnosed cancer cases by at least half. And when prevention is not successful, oncology's continued development of new and improved therapies can also contribute to decreased mortality, increased quality of life, or both, for those diagnosed with cancer.

Cannibalism

Cannibalism, also called anthropophagy, is the human act of eating parts of the human body, including, but not limited to, flesh, muscles, and blood. The origins of the word are a result of a conversational misunderstanding between Christopher Columbus and a guide referring to a group of barbaric people in the West Indies who ate human flesh. While the natives referred to them as Caribs, Columbus called them Canibales by mistake. This idea of savage cannibalism became more popular with the voyages of Captain James Cook in the Pacific Ocean and his ship's many dialogues and encounters with the Māoris, Polynesians, and Tahitians. Reports of cannibalism exist throughout the world, with the first records dating back 500,000 years. These reports have usually focused on groups of people whom the people of the Western world have considered to be barbarians, savages, or others.

Falsified literary reports issued by various governments to spread the rumor of cannibalism in countries such as Russia, Poland, and Ireland in times of crises and war as a means of propaganda have been documented. This is not to say, however, that cannibalism is a complete falsification. Social scientists view societies that practice cannibalism and incidents involving cannibalism in one of three separate ways: psychogenic cannibalism, a means of satisfying mythic and overarching psychosexual fantasies and desires; utilitarian/adaptive cannibalism, an adaptation of hunger or other material deficiency; or hypothetico-deductive cannibalism, part of the overall universal order and a normative function in society.

Within these analytical frameworks of understanding cannibalism, there are also five different categories for various acts of cannibalism. Exocannibalism is the cannibalism of war and the eating of the "other" who is not a member of one's tribe, whereas endocannibalism is the cannibalism of those who are either in, or related to, one's tribe. Survival or emergency cannibalism is the consumption of a human for purposes of nourishment and protein deficiency, and chaotic cannibalism is associated with a power or force that is believed must be eaten to be destroyed. The last type, lunatic-fringe cannibalism, is often dramatically reported; its most important benefit is the reinforcement of the stereotype of cannibalism.

The cannibal ritual of the literal eating of the flesh and blood of a fellow human has been hard to definitely establish because the majority of early accounts with supposed cannibals were based off an ethnocentric colonial point of view. The sparsely populated country of Papua New Guinea has long been spoken of as having an interior populated by cannibals. Tribal groups such as the Fore, the Huli, the Kutubu, the Strickland-Bosavi, the Duna, and the Mianman have allegedly practiced cannibalism. However, the sources for these acts of cannibalism tend to be unreliable as they usually arise as one tribe's commentary on their neighboring, and often enemy, tribe.

There are, however, two strands of evidence that legitimatize cannibalism more so than unreliable neighboring accounts. The outbreak of Kuru, which is a disease of the nervous system studied by Nobel Prize recipient Daniel Gajdusek in the Fore people, tied the degeneration of the cells of the brain to being passed from person to person by cannibalism. Another source that accounts for an accurate depiction of cannibalism is a detailed description of the Miamman raid on the Owininga people of Papua New Guinea, where cases of cannibalism occurred. The police account of the report, which was backed up by witnesses and defendants, cited that the bodies of the victims were cut up and later eaten with a side of taro.

Cannibalism also exists in cultures in the form of mythology. In European and American cultures, creatures such as werewolves, witches, and vampires often consumed human flesh or blood for power and various nefarious purposes. In the Bimin-Kuskusmin culture of Papua New Guinea, there are many tales of witches, sorcerers, and female tricksters (known as *kamdaak waneng*), all whom eat various parts of humans in order to gain power.

Groups of people who have been accused of practicing cannibalism have a number of similar traits. First, they come from societies that are politically homogeneous, and where the local government is the supreme form of power. Second, these people associate themselves with societies that have a history and culture of maternal dependency, a subdued taboo against sexual intercourse, and suppressed male aggression against both males and females. Finally, they come from societies

where there is a significant level of food stress, especially when it includes protein. It is important to note that just because one of these groups possesses these characteristics, does not mean that they will engage in cannibalism (there is no documented link between hunger and desire to resort to cannibalistic practices, for instance).

Emergency cannibalism is highlighted in depth in this entry, as it is the most prevalent type in both historical and contemporary literature, and it continues to be the main form of cannibalism reported in the industrial Western world. Because acts of emergency cannibalism often occur in sparsely populated places, and the practices often belong to a dying, war-like group who is more intent on survival than cultural preservation, there is very little evidence of specific tribes actually practicing this type of cannibalism.

Societies or time periods during which such emergency cannibalism is thought to have existed include the Anasazi Indians of Chaco Canyon in the American Southwest; in Ireland during the Irish potato famine; in China during the Three Kingdom period, the Tang period, and the Han period; during the siege of Leningrad in the early 1940s; and in the Jewish ghettos during World War II. These reports are based on personal accounts and archaeological findings.

There are a number of more prominent incidents in the past 2 centuries that indicate the existence of emergency cannibalism. The first is the infamous case of the Donner Party. In 1846, the Donner Party, organized by George Donner, set off across the Rocky Mountains toward the Sacramento Valley. After disregarding the advice of the group's guide, they were trapped in a series of snowstorms for well over a month. After all the food, including their oxen, horses, and dogs, was diminished, the group contemplated eating the members of their party who had already died. After 5 days of hesitation, they began eating the remains of Patrick Dolan. At the end of their ordeal, approximately 45 people survived, many of whom resorted to emergency cannibalism.

Another well-documented example of emergency cannibalism occurred when an F-227 airplane crashed in the Andes Mountains of Argentina in 1972, carrying members of the Uruguayan rugby team called "The Old Christians." In brief, after using up all of their rations after the crash, the survivors began to consume the bodies of those who had already died; they ate everything from their buttocks, to their hands, to their brains. Just like the Donner Party, there was fear of the social taboo of cannibalism and especially the commentary that their devout Catholic upbringings had for respect of the body. In the end, all of the survivors eventually resorted to cannibalism. After a more than 2-month ordeal, the remaining 16 survivors were rescued and quickly became national heroes. As the Roman Catholic Church justified it, if they had refused to eat the bodies, they then would have been committing suicide, which is a greater offense than cannibalism.

One of the most recent reports of cannibalism occurred on a Vietnamese refugee boat in 1988. After leaving the port of Truc Dang, the motor on the ship faltered and the junk became stranded, as it did not have a sail or a replaceable motor. After running out of food and being ignored by both Japanese and American vessels, Phung Quang Minh, the self-appointed captain of the ship, suggested that the group begin using the bodies of the dead for the living. Unlike becoming the heroes of the Donner Party or Uruguayan air flight 571, Phung and nine others were incarcerated after the junk arrived on the island of Luzon in the Philippines; about half of the original crew survived.

Although still uncommon, contemporary events of cannibalism are found in popular culture, emphasizing the modern world's portrayal of cannibalism as a social taboo and an act of "the other" and "the savage." A contemporary story of cannibalism involves Armin Miewes, who posted an advertisement for a person who was willing to be eaten; Bernd-Jürgen Brandes answered the article and was later killed and eaten. Miewes, who stored parts of Brandes's body for over 6 months, was placed on trial and was later convicted.

Another modern cannibalistic event occurred when Chilean shock artist Marco Evaristti fed dinner guests meatballs that were made out of his own body fat removed by liposuction. Although deemed cannibalistic by the public, the police and government took no action. Other examples are presented in movies such as Fruit Chan's *Dumplings,* Bartel's *Eating Raoul,* and Demme's *The Silence of the Lambs*.

Capital Punishment

Since at least the beginning of written history societies have put people to death, both as a redress to social harms and as a means to control deviant and criminal behaviors. Widespread opposition to capital punishment, however, is a more recent phenomenon, first emerging during the European Enlightenment, as new political philosophies began to take root in the body politic and changing social attitudes toward death and dying emerged. This entry explores the general shift in the cultural orientation toward capital punishment in Europe and the United States, recent changes in its use globally, and contemporary issues regarding the death penalty in the United States.

Capital Punishment in Western Europe and the United States

In 1764, the Italian criminologist Cesare Beccaria voiced the first widely read opposition in Europe to capital punishment. His arguments against capital punishment were part of a shift toward emphasizing individual rights within emerging political and social philosophies. Such philosophies were related, at least in part, to the emergence of new views of life and death in the late 17th and 18th centuries, views increasingly informed by rationalism and science and decreasingly by religion and the traditions of the *ancien régime* that had dominated much of European society and culture for hundreds of years.

Attitudes toward death had been slowly changing since the end of the Middle Ages, including attitudes toward capital punishment. For centuries prior, social life had been governed by rigid forms of tradition, and death was itself common and communal. People died often and early, and the movement from life to death was still a public event and still governed by an adherence to ritual and an assumption of communal salvation. In the case of capital punishment, prior to the Enlightenment, there was little opposition to the idea that some people deserved to be put to death. Executions were generally grisly, public affairs, often accompanied by torture and prolonged suffering, designed to deter other would-be offenders. Bodies of the condemned were frequently left to rot, burned, or scattered; denying one a proper Christian burial ensured damnation in the next world as well.

By the 12th century, images of individual judgment began to replace those of communal salvation. Where this represented a shift in emphasis toward what the French social historian Philippe Ariès called "one's own death," rituals of condemnation and execution nevertheless changed little throughout the Middle Ages, except in one important sense: where capital punishment was increasingly viewed as a means of suffering by which one could repent and be saved. This is evident, for example, in the well-known *Malleus maleficarum* (Hammer Against Witches), written in 1486, which detailed numerous ways in which those accused and found guilty of witchcraft were able to save themselves through confession, repentance, and punishment. In practice, however, tens or even

hundreds of thousands were put to death throughout the late Middle Ages, the Renaissance, and the Reformation, and aside from crimes of heresy or witchcraft, people were put to death for political crimes, crimes against the king, and common crimes. Some parts of Renaissance Europe (e.g., Venice) restricted the use of capital punishment, and thinkers such as Thomas Moore and Erasmus debated its merits, but by and large there was little opposition to, and many opportunities that favored, its use, including wars between states, various inquisitions, the Reformation and Counter-Reformation, and peasant revolts.

While Beccaria is credited with publishing, in 1764, the first widely read opposition to the use of capital punishment, by this time its use was already declining throughout much of Europe. This decline coincides with changing views of death itself in Western Europe that were a result of both social and scientific changes. The emerging bourgeoisie were living longer lives due to advancements in medicine and hygiene. Religious views of death as a transition to the afterlife were being replaced by biological definitions of death as the cessation of organic function, as well as secular doubts regarding the existence of any afterlife at all. New political philosophies argued in favor of an inherent right to life as central to the concept of the social contract.

Taken together, these social, scientific, and political changes undergirded Beccaria's opposition to capital punishment, which he published as part of his 1764 treatise *On Crimes and Punishments*. In this work, Beccaria put forth what is referred to today as the "classical" approach to crime control—an approach that is rooted in a utilitarian view of punishment as a means by which to promulgate adherence to the law and deterrence from criminal activities. In the case of capital punishment, Beccaria drew heavily from the work of John Locke and other political thinkers of the time by arguing that life itself was a right that could not be justly deprived by the state. Beccaria further argued that capital punishment was not only unjust but also ineffective; he proffered that prolonged depravation of liberty, and not death, was more effective in deterring people from criminal acts.

Beccaria's work reflects the beginning of the shift in early modern Europe away from the spectacle of public torture and humiliation as a means of social control. This era witnessed the beginning of the use of prisons in western Europe and the northern United States as a means of "correcting" socially deviant and criminal behaviors. Many forms of public punishment were replaced with the "private" depravation of liberty behind the walls of the penitentiary. Yet public executions remained common in Europe and the United States up through most of the 19th and even the early 20th century. What changed during this time with regard to the use of capital punishment was not its public display, but rather the emergence of the idea of "merciful" or even "humane" death. The French use of the guillotine was seen as a progressive step away from the barbaric practices of execution used in the ancien régime, as was the early use of the electric chair in the United States, which was thought to be a humane alternative to hanging or the firing squad.

By the first decades of the 20th century, death itself was becoming increasingly masked behind the closed doors of the hospital and dressed up in the parlors of the mortician. Within a span of only 50 years or so in the United States, a shift occurred in that a majority who had once died at home now died in institutions; similar shifts occurred throughout western European countries. Sociologists and social historians call this the emergence of "hidden" or "invisible" death, and in the case of capital punishment, executions soon followed suit. Public executions were ceased in Britain in 1868, in the United States in 1936, and in France in 1939.

Executions did not become private affairs due to lack of public interest, however; the last execution in the United States drew a crowd of 20,000 and the last beheading in France was a similar public spectacle. Rather, in western Europe and the United States, capital punishment became increasingly hidden from public view in large part *because* of the controversy and spectacle surrounding public executions. The last execution in France was, by many accounts, a drunken and jeering affair, and the last execution in the United States—of Rainey Bethea in 1936—received substantial negative press coverage. By the mid-20th century, executions in western Europe and the United States were conducted under the auspices of technicians and administrators, and the rancorous crowds that accompanied the last public executions in France and the United States were replaced by executions conducted behind closed doors.

Today, executions are almost nonexistent in Europe and are carried out only in front of victims, family members, and prison staff in the United States. Cultural controversy and fascinations surrounding capital punishment remain, however, and while the public spectacle of the gallows or guillotine have all but disappeared, the popularity of executions on the Internet and on video suggests that attempts to politically and culturally repress the spectacle of executions have not necessarily curbed public interest. Geoffrey Gorer argued in 1955 that death itself had become pornographic in the 20th century, in a manner not dissimilar from that of sex itself under the Victorians a century prior, and the rapid growth of multimedia depictions of executions suggests that a new type of "virtual gallows" has emerged, perhaps no less popular than those a century ago.

Global Patterns in Capital Punishment

Within the 20th century, capital punishment became an increasingly controversial practice not only in terms of its instrumental value as a mechanism of social control, but also as a representation of culture itself. In the past 30 years, all Western industrialized nations, with the exception of the United States, ceased the use of capital punishment. Some European and South American states had in fact ended capital punishment much earlier, and it is often overlooked that states such as Venezuela (in 1863) and Uruguay (in 1907) were among the first to abolish its use. Today the majority of South and Central American states have discontinued its use, although a majority of Caribbean states still retain capital punishment.

Western Europe represents the most regionally concentrated shift away from the use of capital punishment in the 20th and early 21st centuries, but this shift has been occurring globally as well. Following the breakup of the U.S.S.R., a majority of eastern European states discontinued its use, Belarus excepted. Russia and Latvia still allow its use for a small number of crimes, but within the past decade there has been only one known execution in Russia. The democratization of Central and South American states, following years of repressive governments, has likewise seen a decrease in the use of capital punishment.

Globally, as late as 1965, only 12 countries had banned capital punishment, and another 12 had informally discontinued its use. By 2008, about 90 countries had abolished capital punishment and another 30 had not executed anyone for at least a decade. The effect is that the majority of the world's executions are increasingly concentrated in a smaller number of states. According to Amnesty International, 90% of all known executions in 2006 were carried out by six nations: China, Iran, Pakistan, Iraq, Sudan, and the United States.

This small distribution represents the widespread use of capital punishment in both Islamic as well as in authoritarian states. Within Islamic states, only Turkey, Turkmenistan, and Azerbaijan do not use the death penalty. While religion may play a part in the use of capital punishment, the strongest predictor of the use of the death penalty is authoritarian and/or repressive governments. This includes Islamic states such as Iran, Iraq, and Saudi Arabia; communist states such as China, Vietnam, North Korea, Cuba, and Laos; and other despotic or authoritarian governments such as Burma, Zimbabwe, Belarus, and Singapore. Of these states, China by far executes the most people—approximately 1,000 people in 2006—although official figures from China are much lower than most other scholarly estimates.

Capital Punishment in the Contemporary United States

The debate surrounding capital punishment within the United States includes questions regarding the efficacy in deterring or reducing serious violent crime; racial and social class biases present in the use of capital punishment; the potential execution of wrongly convicted persons; the political, social, and ethical desirability of using capital punishment; and the financial costs of capital cases.

Those who support capital punishment tend to believe it reduces or prevents violent crime. Such a position falls within the purview of capital punishment *as* social control, where its primary function is considered one of crime deterrence and prevention. Research is divided on this question. Several studies have found positive correlations between its use and decreasing or potentially prevented homicides, whereas other studies have found no

correlation, or even negative correlations. To date, there is no scholarly consensus on the relationship between capital punishment and deterrence or prevention of homicide specifically or violent crime in general.

Since 1980, however, public support for capital punishment has increasingly taken the form of retribution, not deterrence. Public opinion polls suggest that retribution has become a more popular reason than deterrence for support of the death penalty, reflecting public support for capital punishment *as* social equity. Stated otherwise, more people today believe that capital punishment is justified, even when they do not necessarily believe it functions to deter crime. This change corresponds more generally as well to a rise of overall public support of capital punishment, which was below 50% in the 1960s and rose to a high of around 75% in the 1980s. As of 2007, 62% of Americans were supportive of capital punishment, although this support varies demographically—men more than women, whites more than blacks, Republicans more than Democrats, the middle class more than the poor, and suburbanites more than urbanites or rural populations.

Public opinion polls do not explain, however, why the United States remains the only Western industrialized nation to retain capital punishment. Recent literature on the question offers several competing, and in some case overlapping, explanations. These theories include several recent works that situate American exceptionalism in longer histories of explicit forms of social control and oppression such as slavery, racism, and class conflict; in the tradition of "vigilante values" that first emerged in southern states in the form of lynching and is still present today, where since 1976 about 80% of all executions have taken place in southern states; and in the diverging paths between the United States and countries such as Germany and France during the 18th century, when the latter extended high-status punishments to larger segments of the population, and the former increasingly adopted punitive low-status punishments.

Other scholars have argued, however, that the roots of American exceptionalism are more recent. These arguments have centered on late 20th-century changes in American culture, including the rise in violent crime rates in the late 1980s and early 1990s, growing public fear of crime, the growth of the prison industrial complex and corresponding increases in punitive sentences, changes in media coverage related to violent crime, and the political success of conservative and evangelical movements since 1980. These scholars also point to research that suggests that the use of the death penalty since 1976 is more frequent in minority and poor populations, particularly in African American populations, which are overrepresented both in terms of their overall population in the United States, as well as in terms of capital offenses that have resulted in a sentence of death.

Regardless of the roots of this exceptionalism, it appears unlikely that the legality of capital punishment in the United States will change anytime soon. In 2008, the Supreme Court upheld the use of lethal injection in *Baze v. Rees,* signifying its reluctance to stray far from its 1976 decision in *Gregg v. Georgia,* which reinstated the constitutionality of capital punishment. Four years prior, the Court had overturned capital punishment in *Furman v. Georgia* on Eighth and Fourteenth Amendment grounds, finding that its use was "arbitrary and capricious." Since its reinstatement, however, the Court has heard cases regarding only specific applications of capital punishment, including notably *Roper v. Simmons* (2005), which overturned the practice of executing those who had committed crimes as minors; *Atkins v. Virginia* (2002), in which the Court overturned the use of capital punishment for mentally retarded offenders; and *McCleskey v. Kemp* (1987), in which the Court upheld the execution of McCleskey, who had appealed his conviction by presenting statistical evidence asserting that the use of capital punishment in Georgia was racially biased.

Cardiovascular Disease

The abnormal conditions that affect the heart and blood vessels (arteries and veins) are considered under the umbrella of cardiovascular disease (CVD). The major types of CVD include coronary (or ischemic) heart disease, acute myocardial infarction (heart attack), cerebrovascular disease (stroke), arrhythmias, valvular heart disease, hypertension (high blood pressure), and congestive heart failure. Heart attack and stroke are responsible for most CVD deaths. According to the Centers for Disease Control and Prevention (CDC), CVD has been the leading cause of death in the United States for more than a century (except during the 1918 flu pandemic) and claims more American lives than does cancer each year. Although the death rate in the 21st century (2003) as compared to the mid-20th century (1950) has declined, CVD is still the cause of 37% of all deaths in the United States. Current statistics can be obtained from the American Heart Association.

Cardiovascular disease is also the leading cause of death in many developing and underdeveloped countries. It was responsible for 16.7 million (29.2%) of total global deaths in 2003. In industrialized countries, incident of CVD rises with age, whereas in the developing and underdeveloped countries, the trend is opposite: In those countries, more people of a younger age experience CVD. According to the CDC, the decline in CVD death rates in the United States is mainly due to improved medical care and changes in lifestyle. The average age of having a first heart attack is 65.8 for men and 70.4 for women.

Common Types of CVD

Atherosclerosis (a buildup of plaque inside the artery wall) is the primary malefactor in most of the CVDs. Atherosclerosis in the coronary arteries causes the most common type of CVD, coronary artery disease. The plaque buildup reduces blood flow in the arteries resulting in ischemia (oxygen deprivation to the heart muscle). This causes coronary heart disease leading to chest pain (angina) or a heart attack (myocardial infarction). Coronary bypass surgery is a common treatment for blocked arteries. A blood vessel is taken from a leg or the chest and grafted onto the blocked artery to bypass the blockage. Another procedure to improve blood circulation in the heart is angioplasty. This involves cardiac catheterization and flattening atherosclerotic deposits or inserting a stent to open a blocked artery. Two newer techniques are laser angioplasty and atherectomy. These are often followed by a stent procedure.

The second most common type of CVD is stroke resulting from atherosclerosis and arteriosclerosis (loss of elasticity of the arteries or hardening of the arteries), which affect the arteries that deliver blood to the brain. An artery rupture or blockage of the blood supply to the brain or to part of the brain may result in oxygen deprivation. Due to lack of oxygen, nerve cells die within minutes, affecting the part of body they control. Four types of stroke are cerebral thrombosis and cerebral embolism, caused by clots or plaque blockage of an artery, and cerebral and subarachnoid hemorrhages, caused by ruptured blood vessels. A transient ischemic attack (TIA) is a "warning stroke" or "mini-stroke" that produces milder and short-lived stroke-like symptoms. About 15% of all strokes are preceded by a TIA and 25% of these patients die within a year after a TIA.

Assessment and Symptoms

Blood pressure is the most common and easiest way to assess the status of a person's cardiovascular system. A systolic blood pressure between 120 and 139 mm Hg or a diastolic pressure between 80 and 89 mm Hg is considered "prehypertension," while blood pressure reading of 140 over 90 or higher is considered hypertension. This may occur without symptoms, which is why high blood pressure is called a silent killer. Another commonly used method is electrocardiogram, which measures the heart's electrical activity during rest or exercise. Imaging techniques used to diagnose heart disease include magnetic resonance angiography (also called cardiac magnetic resonance imaging), cardiac catheterization, and angiography. Angiography requires inserting a catheter into the blood vessel and injecting a dye into the heart, which helps reveal the condition of the coronary arteries with X-rays. This technique requires hospitalization.

More men than women have heart attacks; however, heart disease is the leading cause of deaths for American women. Women tend to have less-typical symptoms than men, for example, classic chest discomfort. Their symptoms are more subtle, such as weakness, unusual fatigue, cold sweats, dizziness, and anxiety. Many begin experiencing symptoms long before heart attack (some for a month) actually strikes. Other symptoms that may be experienced by both sexes are shortness of breath, pain in chest/shoulder/jaw/elbow, sweating, and indigestion that is not relieved by antacids.

After patients have been diagnosed with CVD, they are usually advised to change their lifestyle so that they can avoid further complications. These changes include dietary changes, exercise, weight reduction, smoking cessation, and stress management. However, when a person is having a heart attack, emergency care is needed. Risk of death can be reduced by half if one gets medical treatment within the first hour of an attack. Heart attack survivors undergo cardiac rehabilitation after they stabilize. Cardiac rehabilitation is designed to help patients improve their cardiovascular fitness and quality of life. However, only 15% to 35% of patients comply with such programs.

Risk Factors

The precursor of heart disease, atherosclerosis begins early in life, taking many years to develop depending on a person's risk factors. The risk factors for CVD are classified nonmodifiable, modifiable, and contributing factors. A longitudinal study, the Framingham Heart Study, and the 1964 report of the Surgeon General identified many risk factors. The Framingham Heart Study began in 1948 and is now following the third generations of Framingham residents. Although risk factors indicate conditions that are related to CVD and not the causation, risk reduction measures should be undertaken early in life in order to prevent CVD in middle age.

Nonmodifiable risk factors are uncontrollable genetic or physical conditions that cannot be changed through modification of lifestyle. They include gender, advancing age, family history of CVD, and race. Although men have a higher rate of CVD than women, it is also the number one health problem for women in industrialized countries. Before age 60, rate of heart disease is significantly higher in men than women; however, after menopause, the risk for women approaches that of men. Also, their outcomes are significantly less favorable than for men. Advancing age is also a major risk factor for CVD. For every 10-year increase in age, the risk of dying of CVD doubles for both sexes; four out of five people who die of heart attacks are over 65.

Family history is another uncontrollable risk factor. Having one first-degree relative with heart attack doubles the risk, and the risk triples with two or more first-degree relatives with heart attack. Furthermore, the risk is stronger when heart attacks in these relatives occur before the age of 55. Moreover, research into the genetic or racial influence on cardiovascular diseases clearly demonstrates that race is highly associated with socioeconomic, cultural, behavioral, and medical conditions, any of which could explain the differences in the incidence of cardiac arrest and associated deaths. Compared to European Americans, heart disease risks are higher among minority people, including African Americans, Mexican Americans, American Indian or Alaska Native people, and more recently, Native Americans. African Americans have nearly a twofold risk for

CVD compared to European Americans, partly due to higher rates of obesity, diabetes, and hypertension. A recent longitudinal study, the Jackson Heart Study is an effort to help the African Americans reduce the risk factors associated with CDV.

Hypertension, hypercholesterolemia, smoking, obesity, diabetes mellitus, and sedentary lifestyle are modifiable risk factors. Hypertension is the most common disease in industrialized nations that leads to increased risk of stroke, heart attack, heart failure, and kidney failure. Regardless of age or gender, hypertension is the best predictor of CVD. Hypercholesterolemia is another modifiable but serious risk factor for CVD. Cholesterol circulates in the blood in several different forms of lipoprotein; high-density lipoprotein (HDL) is protective and low-density lipoprotein (LDL) is damaging. Total cholesterol equals HDL + LDL + 20% of triglycerides.

Smoking and diet are the two most modifiable factors that relate to CVD. Smoking accounts for about 35% of the heart disease around the world. Compared to nonsmokers, smokers are more than twice as likely to develop heart disease and have a stroke. Diets high in saturated fat are a strong risk factor for CVD, whereas diets high in fruits and vegetables protect against CVD. Consumption of fish, antioxidants, lycopene, selenium, and riboflavin are found to be protective against CVD. Excessive alcohol drinking, sedentary lifestyle, and obesity are also modifiable risk factors for CVD. People who have diabetes are more likely to die of heart disease than those whose sugar metabolism is normal, because high glucose levels are damaging to arteries. Currently attention is being paid to a prediabetic condition of being insulin resistant. It is a silent condition that increases the chances of developing diabetes and heart disease. The 1995 Bogalusa Heart Study was the first study to show insulin resistance beginning in childhood to be a significant predictor of CVD. Insulin resistance is a risk factor for developing CVD over time even when the children are not obese. All modifiable risks can be controlled with lifestyle changes and should be considered early on during one's childhood.

Social, psychological, and environmental factors contribute to CVD as well. Low educational and income levels are both positively related to heart disease. Social support and marriage are also important factors, because spouses or friends help patients by encouraging them to seek medical attention, follow the medical advice, and make healthy changes. Being single and having little social support increases the risk of CVD. Those with previous heart attack who lack social support tend to have greater risk for a second heart attack. Although marriage decreases the risk for CVD, it is the quality of the relationship that has a positive effect on one's health. Stress, anxiety, depression, and cynical hostility/anger are positively related to the development and progression of CVD. However, because these variables are related to each other, it is difficult to assess the effect of each variable. Other contributing factors are sleep deprivation, exposure to high levels of environmental noise and pollution, and periodontal disease.

Prevention

The best way to prevent CVD is to control modifiable risk factors and be aware of nonmodifiable risk factors. Most interventions to prevent heart disease focus on reducing hypertension, lowering serum cholesterol and glucose levels, and making healthy lifestyle changes that include smoking cessation, regular exercise, weight management, good nutrition, and stress management. Psychological programs such as anger management, relaxation techniques, and meditation also show beneficial effects. Health practitioners agree on the following strategies for CVD prevention and management:

- Removing saturated and trans fats from the diet and substituting monounsaturated and polyunsaturated fats
- Eating a diet high in fruits, vegetables, nuts, and whole grains, and low in refined grains
- Consuming omega-3 fatty acids from fish oil or plant sources
- Avoiding excessive salt and sugar intake
- Keeping blood pressure below 140/90 mm Hg (ideally less than 120/80 mm Hg)
- Keeping low cholesterol and triglyceride levels
- Exercising for at least 30 minutes (moderate intensity) on most days of the week
- Achieving and maintaining a healthy weight
- Not smoking; drinking in moderation

Caregiver Stress

Every day millions of Americans serve as caregivers, providing unpaid assistance to family members or friends who are in some way incapacitated and need help with the activities of daily life. Caregiving can have many rewards, but it can also be a significant source of stress for the many caregivers who provide care, often at great personal sacrifice to their own physical, emotional, social, and financial well-being.

Caregiver stress has been studied extensively and negative consequences of caregiving have been clearly documented; nevertheless, researchers find significant variability in how caregivers adapt over time to the demands of caregiving. This variability can be attributed to numerous factors. The relationship history between caregivers and care recipients can be grounded in respect and love, or anger and resentment, each resulting in different emotional reactions by the caregiver to the demands of caregiving. Additionally, disability and disease characteristics vary significantly from one care recipient to another, placing unique demands on caregivers. Caring for elders with dementia, for example, is found to be generally more physically, emotionally, and socially stressful than caring for elders who are simply physically frail. Those living with the care recipient often report greater stress than those who don't, and the intensity and duration of care provided also are important determinants of stress. Those who provide care the longest and with the greatest number of responsibilities generally report feeling the most stressed. Finally, the meaning that caregivers assign to the demands of caregiving and their perception of how well they can cope with those demands play a critical role in influencing stress levels. The actual demands of caregiving may be less important than the caregiver's reaction to them and the coping resources, both internal and external, that the caregiver believes he or she has available.

Just as the demands of caregiving are multifaceted, so too are the stress-related consequences of providing care. Many caregivers report that over time, the demands of caregiving take their toll physically, emotionally, socially, and financially.

Physical Consequences of Caregiving

Numerous researchers have found caregivers to be at an increased risk of physical illness and premature death compared to noncaregivers. One study found that elderly spousal caregivers who reported experiencing high levels of stress were 63% more likely to die earlier than control subjects. Researchers have also established that in general, stress affects one's health by increasing blood pressure, suppressing the immune system, delaying wound healing, increasing cardiovascular risk, increasing levels of stress hormones, and prematurely aging cells.

Specific to caregiver stress, Ohio State University researchers found levels of interleukin-6 (IL-6), a substance that plays a role in immune system regulation, to be four times higher among Alzheimer's caregivers than noncaregivers. Not only were IL-6 levels significantly elevated, but the levels remained elevated for years, even after caregiving responsibilities had ended. These findings are important, because excess IL-6 is related to various health threats, including, for example, increased levels of

C-reactive protein (CRP), a risk factor for cardiovascular disease. Additionally, elevated levels of both CRP and IL-6 are related to arthritis, diabetes, congestive heart failure, and osteoporosis, diseases that significantly reduce one's quality of life and can increase the risk of early mortality.

In a seminal study exploring the relationship between stress and cellular aging, researchers at the University of California, San Francisco, found that stress prematurely ages cells by shortening the telomeres that cap the ends of chromosomes. Stress was also found to increase oxidative stress and lower levels of telomerase, a cellular enzyme that protects telomeres from breakdown and normally protects cells from premature aging.

The researchers compared mothers who cared for chronically ill children to mothers of healthy children and found that mothers in both groups who reported high perceived stress showed cellular signs of premature aging. Among the caregiver group specifically, the longer the mothers provided care and the more stressful they perceived their caregiving, the higher their oxidative stress, the lower their levels of telomerase, and most importantly, the shorter their telomeres. Additionally, the chromosomes in the white blood cells belonging to mothers who viewed their caregiving responsibilities as most stressful had aged the equivalent of 9 to 17 years more than the mothers who viewed caregiving as less stressful. Finally, the women who provided care the longest, regardless of their perceived stress, had the shortest telomeres of all. The implications of this research are significant because telomere shortening is strongly associated with reduced life span.

In summary, chronic stress related to caregiving can result in a reduced life span, premature cellular aging, or serious physical health consequences that can last for years after the caregiving responsibilities end. At greatest risk may be those caregivers who perceive their caregiving role as most stressful and who provide care the longest, such as spousal caregivers of Alzheimer's victims and special-needs children, many of whom provide care in excess of 100 hours per week for many years. Additionally, among elderly and/or physically vulnerable caregivers, the strain of caregiving can exhaust their already limited physical resources and exacerbate existing medical conditions. Finally, in addition to the physical risks associated with caregiver stress, some caregivers suffer even greater physical consequences because they develop negative coping behaviors such as unhealthy eating habits, not exercising, getting too little sleep, smoking, and abusing alcohol.

Emotional Consequences of Caregiving

In addition to the potential for harmful physical consequences when providing care, caregiving may also take a significant toll on the emotional health of caregivers. A substantial body of research shows that family caregivers are significantly more vulnerable to depression and anxiety than noncaregivers. In fact, depression is often cited as the most pressing concern for caregivers. Many studies of Alzheimer's caregivers have found rates of depression between 43% and 46%, with spousal and female caregivers reporting the greatest depression and one third of adult children showing signs of clinical depression after 1 year of caregiving. These high rates of caregiver depression are disturbing because depression can permanently alter the body's immune system.

Some researchers report emotional stress ratings that range from 4 to 5 (on a 5-point scale, with 5 representing the highest possible emotional stress) among those who provide care for 40 hours per week or more. Anxiety is also a concern for at least one third of caregivers. Irritability, anger, loss of self-esteem, guilt, despair over watching a loved one suffer, grief, and complete emotional exhaustion are also commonly reported emotional responses to caregiver stress.

Social Consequences of Caregiving

Studies have long shown a positive relationship between a strong social support network and reduced levels of stress, and access to a good social support network can buffer many of the physical and emotional consequences of caregiving. Unfortunately, over half of all caregivers report having less time for family and friends since assuming their caregiving responsibilities. Caregivers often report feeling socially isolated because, as they become less physically and emotionally available for others, their social lives become increasingly

constricted. Friends and family may not fully appreciate the sometimes all-consuming nature of the demands placed on the caregiver and may feel that the caregiver simply doesn't want to make time for them. This is often the case when caregivers provide assistance for a loved one with dementia. Those who have never encountered dementia firsthand may assume that since the care recipient looks healthy, he or she cannot possibly require extensive care. Others may drift away and stop visiting out of disinterest with the challenges the caregiver faces, or because of embarrassment about not knowing what to say to the caregiver or how to act around the care recipient.

Some caregivers may also push potential offers of support away because they feel that nobody else can provide adequate care for their loved one, or they believe they should be able to do everything themselves. Asking for and accepting help is seen as an imposition, weakness, or failure. Because of this strong sense of responsibility for meeting all of the care recipient's needs, the caregiver sacrifices both a personal life and a social life. The caregiver's interactions become increasingly confined primarily to the dependent relative, often when they most need the support of their friends and family. At that point, the social cost of caregiving may take an exhaustive toll on the caregiver.

Financial and Occupational Consequences of Caregiving

The financial and occupational consequences of caregiving can also be significant. Employed caregivers may suffer losses in career advancement, salary, and retirement income as a result of the demands of caregiving. Several nationwide studies have found caregivers in the United States earn less than the national median income and most provide at least $200 of financial assistance monthly to meet the needs of the care recipient.

Additionally, many caregivers struggle to manage the often competing demands of their caregiving and occupational roles. Sixty percent of caregivers work full-time or part-time while providing care for their loved one, and many feel that caregiving responsibilities negatively affect their work. Several large studies have found that nearly 60% of caregivers report going into work late, leaving early, or taking time off to provide care. Additionally, about 17% of caregivers take a leave of absence, 10% shift from full-time to part-time work, 4% turn down promotions, and 3% retire early. It has been reported that nearly half of parents caring for children with mental health disorders must leave the workforce at some time due to the demands of caregiving, and 27% are fired because of caregiving demands. Overall, roughly 6% of all family caregivers quit working because of the conflicting demands of their jobs and caregiving.

Finally, some experts estimate that American caregivers can lose up to $651,000 in wages, pensions, social security, and other benefits over their lifetime. Clearly, the financial and occupational hardships that caregivers face pose a significant source of stress.

Coping With Caregiver Stress

Coping with caregiver stress is an ongoing process, and at various points in time different features of the care recipient's condition will precipitate new challenges and adjustments. Thus, coping methods will necessarily change as the care recipient's needs change. Further, just as the demands and consequences of caregiving are multifaceted, so too are caregiver coping skills. Caregivers report relying on prayer, talking with or seeking advice from family and friends, reading about caregiving, exercising, seeking information on the Internet, talking with a professional or spiritual counselor, or taking medication when appropriate, as in the case of the caregiver who develops severe depression or anxiety.

Seeking out support, learning about and utilizing community resources, and engaging in personal self-nurturing are essential to managing caregiver stress. Ultimately, coping with caregiver stress can be reduced to one basic underlying challenge: the juggling act of balancing the caregiver's needs with those of the care recipient. Even high levels of caregiver stress can be buffered by adequate self-care and support.

Caregiving

In its most general meaning, caregiving is the providing of what is needed. *Caregiving* is used both as a noun and as a verb. As a noun, it refers to the organization of health care. As a verb, caregiving refers to both "taking care of," which means that one's specific needs are met, and "taking care for," which means that needs are met with feeling, motivation, and engagement. Caregiving is relevant for the issue of dying because it helps people to die in peace and with dignity. Since engagement is believed to be the heart of caregiving, care for the dying is particularly characterized by the care for the emotional impact that imminent death has on the one who dies. Various ideals of care for the emotional impact of death have affected the practices of care for the dying. To explore the ideals of care for the emotional impact of death, a sketch of its ideological development is presented. From there, three main issues in contemporary care for the emotional impact of death are explored.

Ideals of Care for the Emotional Impact of Death

Consolation for Mortality

In ancient Greece, the ideal of care for the emotional impact of death is particularly reflected in the consolation literature. The main aim of this literature is to achieve inner-world happiness in spite of one's mortality. Consolation is provided through a reflected meditation on the place of death in the cosmic order, the immortality of the soul, and the intangibleness of death itself. For example, arguments are presented about the limited meaning of death, about the fact that we all share in our mortal human condition, and about the pointlessness of grieving, for it doesn't help us any further. Care for the emotional impact of death is thus mainly directed at a consolation for human mortality.

The consolation ideal of care for the emotional impact of death is mainly found in Stoicism and (neo)-Platonism. Both movements believed that a virtuous directedness of the soul, in combination with a renunciation of one's attachment to life, console for one's mortality. Although many texts in Greek philosophy provide consolation, Krantor of Solio (ca. 330–268 B.C.E.), Cicero (106–43 B.C.E.), Seneca (4 BC–65 C.E.), and Plutarch (ca. 46–120 C.E.) are the most important representatives of this genre. At the basis of the consolation literature lies the conviction that feelings should be guided by reason. The ideal of this care for the emotional impact of death is to diminish and control one's grief rather than to suppress one's emotions.

Preparation for Afterlife

During the Middle Ages, the consolation ideal for the emotional impact of death is complemented by the Christian value of suffering. Through the resurrection of Christ, death is no longer the end of everything but becomes the step to a transcendent reality. Suffering is no longer accepted just because of its place in the order of things, but also for its purifying effect on humans' sinfulness. Besides heaven and hell as possible places for the afterlife, interest is increasingly paid to purgatory where the soul awaits its final judgment. The church teaches the remission of sins through praying, penance, and indulgences. The ideal of care for the emotional impact of death thus becomes directed at the preparation for the afterlife before God's final judgment.

The preparation ideal of care for the emotional impact of death did not conflict with the consolation ideal of the Greeks. Minucius Felix (2nd century), Tertullian (d. after 220 C.E.), and Lactantius (d. ca. 330 C.E.) elaborated upon stoic thoughts. Boethius (480–524 C.E.) famously integrated the care as a consolation for mortality with the care as a preparation for the afterlife. Christian consolation texts are written by St. Paul (d. 67 C.E.), St. Cyprianus (d. 258 C.E.), St. Basil (329–379), St. Gregory (332–400), and St. Ambrose (ca. 337–397). A late medieval and popular work on care for the emotional impact of dying is the *Ars moriendi*. This work consoles the dying, warns the terminally ill about wrong mental attitudes, and shows how one should pray and communicate with the dying in order to prepare them for the afterlife.

Humanization of Death

From the Renaissance onward, the preparation ideal for the emotional impact of death becomes criticized. Reformation thinkers, such as Luther (1483–1546), reject the church dogma on the existence of a purgatory and thus the possibility of repentance after death. For them, one's faith in the moment of death becomes crucial. This led to a focus on the death scene in which the last words of the dying were thought to be indicative of the quality of the transition to the afterlife. Humanists, such as Erasmus (1466–1536), claim that Christ, and not the church, is the mediator between man and God. For them, man has his own responsibility in defining death. The ideal of care for the emotional impact of death thus becomes humanized, for it addresses the human capacity to assign meaning to death.

The humanization of death appears in the texts of various influential authors. For example, Hume (1711–1776) justifies suicide in the case when life becomes unbearable due to sickness, misfortune, and old age. Schleiermacher (1768–1834) adds to the orthodox and mechanistic otherworldly consolations the human urge to love each other for we always live in the face of death, and James (1842–1910) opens new perspectives on personal spirituality and immortality. The growing diversity of the meanings of death thus differentiated the ideal of care for the emotional impact of death various sub-ideals—varying from providing consolation, stimulating penance, bringing about faith, and exciting the experience of the sublime in nature.

Autonomy in Dying

From the late modernity onward, the growth of scientific understanding resulted in better hygiene, higher standards of living, and a longer average life span. Technological developments, such as artificial respiration, dialysis, and penicillin, opened the way to increasing control and postponement of death. The ideal of a care for the emotional impact of death became both disregarded and depersonalized. Terminal care often remained unorganized, and the imminence of death was generally not communicated to the dying. In reaction to these developments, doubt arose about the appropriateness of endless treatments, and new settings for dying—such as hospice and palliative care—arose. Focusing on the individual needs of the dying person, the ideal of care for the emotional impact of death becomes directed at the autonomy in dying.

The primacy of autonomy—together with technological progress, secularization, and inner ways of spirituality—forms the context in which present-day caregivers take care for the emotional impact of death. Although the concept of autonomy only becomes relevant from the 1960s onward, its meaning has been developed since the 18th century. For example, for Kant (1742–1804) autonomy

means to act out of free will in accordance with the objective moral law; Mill (1806–1873) sees autonomy as the subjective freedom of choice between options; and Sartre (1905–1980) defines autonomy as an identification and engagement with oneself. These differences have significant implications for the current ideal of care for the emotional impact of death. Three of these implications are discussed in the following section.

Implications of the Primacy of Autonomy

Finding the Right Moment to Die

Due to the primacy of autonomy, the suffering inherent to dying is increasingly understood as meaningless suffering. Living in a society where chronic illness is the main cause of death, the elderly are increasingly subjected to physical and psychic limitations. Many of them face a slow but certain loss of autonomy, control, and independence. Due to the fragmentation and weakening of religious meanings of death, this loss of autonomy in the dying process is increasingly defined as unbearable, hopeless, and degrading. As a consequence, old people increasingly prepare for a death without suffering.

The number of old people who commit suicide is increasing, as is the number of people who arrange advance directives in which they settle abstention or termination of treatment in the event they should be unable to give informed consent. Termination of treatment in the case of irreversible coma or persistent vegetative state is heavily debated on the basis of what the patient would have decided. Although few countries have legalized voluntary euthanasia and physician-assisted suicide, many countries face problems in dealing with these issues. These developments show that individual control of when and how one wants to die has become part of the Western context of dying. The ideal of care for the emotional impact of death thus increasingly implies care for what is considered to be the right moment to die.

Finding Meaning in Dying

The primacy of autonomy changes the relationship between caregiver and the dying person. The dying expresses the need for help of others, decides what personal or spiritual path is to be taken, and gives meaning to death. The caregiver is sensitive to the wishes and emotional processes of the dying person and aims for adequate response. As long as this response is connected to the autonomy of the dying, adequate care is provided. However, the primacy of autonomy falls short when the dying is overwhelmed by the emotional impact of death. One-sided care based on autonomy then risks losing sight of its most important goal: to care for the emotional impact of dying in which one's autonomy is lost.

Care for the emotional impact of death is often a compromise between paternalism and respect for autonomy. Too much initiative may result in misplaced conversations about God and the afterlife or to premature advice. Too much respect for autonomy may result in letting a person die without adequate care for the emotional impact of death. Although various care ethicists have purported to resolve the dilemma by stressing the mutual relationship between caregiver and the dying person, the problem of autonomy in dying remains paramount. The ideal of care for the emotional impact of death thus increasingly implies care for the annihilation of one's autonomy.

Finding Engagement With Dying

The primacy of autonomy rejects rather than engages with the phenomenon of dying. The media mostly presents death without connecting to normal experiences of dying; in both public and private it is taboo to speak about death; and the societal focus on youthfulness and ambition disregards the vulnerability and finiteness of life. In health care, the focus on treatment leaves little space for the issue of dying; professionals are supposed not to overidentify with the dying; and when dying finally occurs it is mostly in hospitals and nursing homes, which support the dying and their families only to a limited extent. Care for the emotional impact of dying is thus embedded in a disappearing face of dying of Western culture.

Generally, engagement largely depends on identifiable mutuality of experiences—people feel closer or more sympathetic to others when they recognize their experiences. Because dying normally lacks such mutuality, it is extremely difficult for caregivers to understand what the emotional impact of

death is about. In order to know "when to do what" it is often suggested that caregivers themselves confront the notions of death and dying. Since society increasingly fails to provide the opportunity for such personal confrontations, caregivers lack general experiences with death and dying. Therefore, the ideal of care for the emotional impact of dying increasingly implies care for finding engagement with dying as such.

Caskets and the Casket Industry

The term *casket*, sometimes denoted as *coffin*, refers to the container in which the dead are placed for burial. In the earliest times of humankind, simply wrapping the deceased and placing in a cave or burying in a shallow grave was considered sufficient. But as cultural rituals became more prominent, it became common to produce burial enclosures out of woven reeds, pieces of wood, pottery, or stone. The status of the family was important, as the costs and handling increased with the more elaborate designs and materials. Even simple burial vessels could be augmented with personal belongings of the deceased wrapped in cloth or put into small pottery; these belongings were considered a necessity for the soul of the deceased to carry to the spiritual world. As the use of wood and pottery became common, designs of faces, flowers, and earthly material holdings became a part of the ceremony prior to burial. Over time, improved technologies enhanced the craftsmanship involved in casket building and these provide the backdrop for the discussion in this entry.

The Art of Casket Making

The stone coffins were the most difficult and required stone masons/carvers to cut and decorate as desired. Moving and setting stone enclosures required teams of people and equipment to set in the burial site. Many early customs required that the body be "free to the sky" so the spirit could travel to its next destination. Even funeral pyres and cremation platforms included some kind of ceremonial wrap of the deceased and accompanying artifacts of the person's life.

Burial vessels were crafted and manufactured by hand until the 1900s when assembly lines began to be utilized by the larger manufacturers of caskets. Even the early lead, steel, and hardwood caskets were handmade products that could easily be custom fitted with colors, materials, and décor chosen by the family. The earliest wooden coffins were usually simple, and the church would provide various covers for them prior to burial for a more elaborate ceremony of the loved one's life. These mortuary cloths could provide religious symbols, colors, and habits of the deceased for the celebration, then be removed upon placing the coffin into the grave.

The early wood coffins were larger at the top to accommodate the shoulders and small at the bottom foot end. Some had windows above the head, so the deceased was viewable during the ritual showing prior to burial. At the beginning of the 19th century, this design became rectangular, which was easier to manufacture, as mass production became common. As the eight-sided coffins became less common and the six-sided caskets were in demand, the assembly line mass production process became more common.

It was in the mid-1800s that the first casketed steel casket was offered, but materials of the time made it difficult to use. Later, sealing materials and fasteners made the gasketed caskets more common. The seal on the casket was offered to stop elements of earth and moisture from entering the interior of the casket, while allowing the gases of decomposition to escape. As with the early pottery or stone enclosures, when metals became common in the manufacture of caskets, the status of the deceased could dictate the type of metal utilized, from copper and bronze with gold trim to the reduced costs of simple 20-gauge units with single colors. Social status has been tied to burial containers since the beginning of their use.

Modern assembly lines consist of conveyer belts and large metal or wood working machines that can process 100 to 1,000 caskets daily. Seam welders, power drivers, and powder paint booths make it possible to manufacture large numbers and higher-quality caskets than ever before. These modern assembly lines also provide the market with quick delivery, which is required due to the time element between death and burial. Instead of being limited to the units on display at any given funeral home, the family can now pick the casket material, color, fabric, and custom touches and expect delivery within days. The reason that burial rituals have become so elaborate and versatile may be, in part, because so many choices are available.

Casket use has become quite complicated when compared to its earliest beginning. One of the aspects of the various customs of contemporary societies is that the original simplistic wooden box continues to be used in a large part of the world. Many areas still prefer that the body of the deceased start the decomposition process as soon as possible and return to the earth quickly. Even today, many customs are to simply wrap or enclose the remains and bury soon after death. The custom of embalming was an option to allow transfer of remains back to their home of origin and to allow time for relatives to gather for the ceremony.

One of the critical periods of growth for embalming was the Civil War, during which so many soldiers died and were returned to their home areas for family ceremony and burial. This ritual was hand administered until 1920 when the first electric embalming machine was perfected and allowed quicker preparation of the body along with refrigeration to keep the condition acceptable for ceremonial showing and services. This process, along with the gasketed containers, provides an environment that can keep the remains intact for many years. This is very important due to modern transient society and the distances normally required when bringing the deceased and family back to a common area.

Laws Affecting the Industry

All funeral homes that handle and prepare the deceased are under state of location laws that require licensing for the funeral home employees who work with the families and deceased. Funeral home personnel must also adhere to strict continuing education requirements each year that keep them abreast of new equipment, chemicals, and handling and procedures for burial. Some states require that caskets be sold only by licensed funeral directors. Safety procedures for the embalming room and procedure are also constantly under scrutiny and must be renewed regularly. Cemetery and crematory regulations are also an important aspect of continuing education. State regulators make frequent visits to these facilities and inspect all operational aspects to confirm compliance. The stretchers, lifts, operating tables, tools, vehicles, and display platforms also require certain specifications so that every item is safe for use with various sizes of the deceased.

Contemporary Caskets

There are many choices of construction and materials available for caskets and each has inherent characteristics, advantages, and price points that are necessary to meet the needs of the customer interested in selection. The predominate manufacturing materials are steel, wood, composites, and cloth. The interiors include a multitude of fabrics available, including velvet, silk, crepe, satin, twill, cotton, and polyester. How we choose to honor our dead with their final vessel of viewing, transport, and burial thus follows.

Steel

This includes bronze, copper, stainless steel, 18-gauge steel gasketed, 16-gauge steel gasketed, 20-gauge steel gasketed, and 20-gauge steel

nongasketed. Bronze and copper are the top end materials used for caskets due to their precious metal status and ability to be brushed and finished with high appearance paints and lacquers. All of these units are furnished with gaskets that help protect the casket contents from the elements present after interment. They also have advanced closing mechanisms that assure as tight a seal as available utilizing the gaskets provided. The interiors are normally comprised of either silk or velvet. These caskets would fall into the highest cost category.

Stainless steel is the next level of protective material available, providing long-lasting life and normally gasketed to keep out elements after burial. Interiors are normally velvet or crepe. Finishes are smooth or brushed with natural stainless steel finish or high-quality paint finishes.

Prices are high to lower end high. The most popular casket in volume is the 18-gauge steel casket, due to its medium-level pricing. This casket is gasketed to provide protection from the elements after burial. Many finishes and colors are available as well as a multitude of interiors, including velvet, crepe, and velour. All of these caskets are supplied with support beds on which to place the deceased; most have adjustable height mechanisms to accommodate various size bodies. Matching interior fabrics, pillows, and decorative head panels in the casket lid come with the units. Depending on the needs of the area served, most caskets also are available in either "split lid," where the head-panel lid is opened only to display the deceased from waist to head, or "full couch," in which the entire lid of the casket is one piece to allow entire body display. When closed and ready for transport, the units are supplied with either swing bar handles that fold flat for display and are hinged for lifting the casket or fixed bar handles that are stationary. These caskets are also supplied with memorial tubes inserted in the end of the body of the casket or identification card kits inside so the deceased can be properly identified in case of identification upon disinterment or a tragic misplacement of the casket/body at a later date. Twenty-gauge caskets are the most affordable steel units and come in both gasketed and nongasketed constructions. The gasketed units have a larger choice of color finishes and interiors while the nongasket models have simple interiors and few options, thus providing lower costs when needed. The metal on the 20-gauge casket is thinner and weaker than the

Twenty-gauge metal casket with blue tremaine crepe interior and pleated head panel with capability of themed insert. Swing bar lifts for ceremonial transfer with decorative hardware and gasketed closure. Includes memorial tube for possible disinterment and available in multiple color combinations and for personalization.

Source: Aurora Casket.

other steels listed in this entry and are not recommended for heavier contents. Average-size bodies will fit and carry sufficiently. The nongasketed models will not keep elements from entering the casket body and hastening decomposition.

Wood

The finest hardwoods available are used to manufacture the mahogany and walnut caskets. These units are available in various shaped corners and finishes and are usually outfitted with velvet interiors. The wood grain is left visible, then stained and polished for exquisite presentation of the deceased. All are supplied with pillows and throw blankets to cover the bottom end of the body displayed. Cherry, oak, and maple are the next level price range, which is in the mid-expensive range. Velvet and crepe interiors are used with matching head panels, pillows, and throws. Swing bar handles are provided for ease of transport. All of the these hardwoods are quite heavy when occupied and require sufficient strength to carry. Gloss and semi-gloss finishes are available on most.

Pecan and hickory round out the hardwood caskets available and are stained with various color stains that bring out the significant grain in their appearance. Poplar, cedar, pine, and ash are also available and rate in the expensive to mid-expensive range of cost. Velvet, crepe, and satin interiors are used. Light pine, composite, and veneer units are also available for lower pricing levels and, though having a nice appearance, may not hold up as well after interment.

Cloth

The least expensive caskets are made of composite wood products or strengthened fiberboard and covered in decorative cloth finish. These units are designed for the lowest budget needs and should not be used for oversized or heavy bodies.

Cremation

Soft woods, pressed composite board, or cardboard are used in simple vessels to accommodate the deceased to the crematory.

Oversize

When larger bodies are prepared, it is sometimes necessary to utilize caskets with additional width to accommodate the deceased. These are available in oak, cherry, poplar, 18- and 20-gauge steel, and in numerous colors and finishes. The offering assortment grows annually with need. Prices are slightly higher than the normal-size caskets mentioned earlier in similar materials and finishes.

Unfinished basic pine casket with white satin interior and head panel also meets the needs of orthodox burial.

Source: Aurora Casket.

The casket industry is presently supplied by three major U.S. manufacturers, namely Batesville, Aurora, and York/Milso, as well as a multitude of smaller suppliers across the country. Caskets are starting to be supplied from Mexico and China and are impacting the overall price and quality expectations of funeral homes across the country. Cremation is also impacting the industry and growing yearly. This has opened a large market for cremation caskets and urns of various applications and cost. As society changes its customs and requirements, the industry will continue to support the various needs of families honoring their deceased.

Causes of Death, Contemporary

The cause of death is a short statement that informs a reader as to the reason for an individual's death. Strictly speaking, it should be divided into the medical cause of death, or a short statement of an illness or medical condition that was responsible for the death of the individual, and the manner of death, which is a legal conclusion on the circumstances of an individual's death. While this appears to be straightforward, for many physicians, lawyers, and ethicists, this can be the most difficult issue with which they must deal.

Historical Developments

Death was defined historically and by "common law" to be the condition whereby the circulation (heartbeat) as well as the breathing of an organism had stopped. This was easily understood by all and required no medical training. Even so, medical doctors were frequently asked to attend a death and confirm that these physiological events had occurred.

This determination of death became more complex and controversial when the World Medical Association, at its assembly in Sydney in 1968, introduced and adopted the concept of brain death. This concept can be further divided into that of brainstem death, as adopted in the United Kingdom, and that of whole brain death, as adopted in the United States in 1980 with the Uniform Determination of Death Act.

The medical cause of death can be as variable or colorful as the individual doctor writing the statement. François Bossier de Lacroix is credited as the first person to propose a systematic classification of disease in the treatise *Nosologica methodica*. The statistical study of diseases for practical purposes had a century earlier been exemplified by the work of John Gaunt on the London Bills of Mortality. William Farr, a medical statistician with the General Register Office of England and Wales, along with Marc d'Espine, is credited with developing the first internationally applicable and uniform classification of the causes of death. This led to the Bertillon Classification of Causes of Death in 1893, a classification that was later developed into the International List of Causes of Death. Successive revisions and lists were introduced.

In 1948, the World Health Organization prepared the two-volume *Manual of the International Statistical Classification of Diseases, Injuries, and Causes of Death*. In 1955 and then in 1965 the seventh and eighth editions, respectively, were published. The ninth edition followed in 1975, and the tenth edition was first introduced in 1989. Modifications to the classifications continue, and several new versions of the tenth edition have been promoted.

Determination of the Cause of Death

Under ideal situations, the following would be the background for the determination of a cause of death statement. A trained, qualified physician will attend the death of an individual wherever this may be. This doctor will make determinations to establish the fact of death and will then decide on the medical cause of death. In doing this, available medical records and charts are reviewed to determine if a disease or disease condition caused the death. If this was possible, some form of document containing the name of the deceased

individual, the place of death, the time of death, and the medical cause of death can be issued, and this information can then be registered with a legal authority such as the registrar of death. Upon such registration, action can be taken to initiate funeral arrangements, death duties, and inheritance procedures.

However, many reasons exist for why a medical cause of death cannot be determined. The death may have occurred suddenly and unexpectedly, for example, and, in such a situation, there is no prior information of disease or poor health that may suggest a disease process. This is particularly true when a death occurs outside a hospital. Even when death occurs in a hospital, the death of the patient may happen so quickly that blood tests and X-rays have yet to be performed. Hence the clinician is without objective information to suggest a medical cause of death. In some circumstances where the medical cause of death is clear, the death will still have to be reported because the death was due to unnatural causes such as poisoning or traumatic injuries. When the death is due to unnatural causes, the death will then be reported to a medico-legal death investigative authority such as a coroner, a medical examiner, an investigating magistrate, or judge. This death will then be investigated through detailed examination of medical history, medical illness, circumstances of death, and postmortem tests, including postmortem examination of the body. Only after such a review can the medical cause of death and the manner of death be determined.

A postmortem examination may be required to establish the cause of death. However, research has found that the autopsy rate in the United States falls below 10% (to nearly 5%) when unnatural deaths such as accidents, homicides, and suicides are excluded. Moreover, the autopsy rates for the elderly and for certain diseases, such as cerebrovascular diseases, are particularly low. Despite the efforts of the College of American Pathologists, which strongly advocate autopsies, the decline in the autopsy rate in the United States continues.

This phenomenon is not unique to the United States. In many countries around the world, the number of autopsies performed is decreasing to such an extent that they are no longer a part of the experience for medical students. Indeed, in Australia and Hong Kong, trainee hospital pathologists are finding it difficult to gain adequate experience in performing the number of autopsies required to demonstrate their clinical competence.

In Switzerland, postmortem examinations are now being replaced by postmortem full body CT (computer tomography) and MRI (magnetic resonance imaging) scans. In autopsy rooms, CT scanners are being installed and less-conventional autopsies performed. This declining trend for conventional autopsies can be easily explained. The general public has never embraced autopsies. The autopsy is still viewed as a gruesome, disfiguring, and destructive procedure. The development of better and more imaging technologies have led to the assumption held by many individuals that the autopsy is redundant because everything inside the patient can now be seen. Health authorities in general are not overly enthusiastic about building better and safer autopsy rooms because of costs and, perhaps also, because the autopsy findings more often than not lead to compensation payouts for wrong diagnoses.

The Politics of Death Investigation

The cause of death statement is ideally an exhaustive and scientific analysis of all relevant medical information to arrive at a learned conclusion. Such cause-of-death data, when gathered systematically, can allow epidemiologist and health policymakers to understand the burden of diseases in their community and to target prevention strategies and health care resources.

Cause-of-death data are used to inform national statistics as well as to allow international comparisons. The *International Classification of Diseases* (ICD) has gone through many versions since 1946, and the current *ICD-10*, first introduced in 1989 and last updated in 2007, is the common tool used by the World Health Organization (WHO) to study world health and disease burden.

The adoption of the ICD system theoretically allows WHO to monitor the state of health of the world population and to develop strategies specific to regions and countries. At present WHO has 228 member states reporting to its ICD system. This provides a broad range and wide coverage of countries in the various regions of the globe and involves well-developed as well as underdeveloped countries.

The reality, however, is that many countries are not using any ICD codes or are using older versions of the ICD codes. These countries often do not have adequate health care systems and are most in need of help. Yet, ironically, because of the absence of data, little is known and aid is often not forthcoming.

Death reporting systems require a stable legal system. Countries in political turmoil or in a state of anarchy and lawlessness are unable to gather and register such information, and here again the absence of information will also lead to less international understanding and less aid.

The politics of death registration can also be seen locally; regimes may wish to manipulate data on causes of death. Increasing reports may attract attention and resources for specific research areas or projects and are hence encouraged. Conversely, increasing reports of an infectious disease may cause alarm among incoming tourists on occasion, leading authorities to suppress such information. Even at the individual case level, the politics of death registration can have a profound impact on individual lives and communities. In such situations, the issues usually revolve around the uncertainties of death determination, causation of death, and manner of death.

Declining Autopsies

It is obvious that the ideal determination of death does not exist in all areas of the globe. Even in developed countries where the medical and legal systems are in place and the possibility of obtaining accurate cause of death data is better than in lesser-developed countries, most experts argue that there is at least a 15% error rate. This stems from an inherent error in determining the cause of death in cases where no autopsies are performed. A continuing decline in autopsy rates worldwide creates an even greater concern over the accuracy of the cause of death data.

The Cause of Death Classification

An area of error lies in the actual process of writing a cause of death. Even in developed countries with structured and controlled systems of medical education and training, there is inadequate instruction on how to determine a cause of death. It is therefore common to find mistakes in the cause of death statement found on issued death certificates. Such mistakes should ideally be noticed by registrars of deaths who can notify the doctors concerned to have the mistake corrected. However, this process of counter-check is rare and seldom systematically applied.

Another limitation of the current system is that it allows effectively only one underlying cause of death. In many developed countries with aging population, death may be the result of a combination of degenerative diseases and failing organ systems. Thus their representation will often be underreported. Emerging diseases, such as the severe acute respiratory syndrome (SARS) in 2003, can cause confusion as they may be coded in a variety of different ways and lead to underreporting of the actual burden of the epidemic. In Hong Kong, where nearly 300 persons were reported to have died from this condition, the causes of death issued varied from pneumonia, to adult respiratory distress syndrome, to SARS, to corona viral infection.

In rural communities and in underdeveloped countries, the basic requirements of trained medical and legal personnel are often absent. It is, therefore, not surprising that the cause of death statement would not conform to those expected by the ICD system. Even where they do conform, the basis of such a conclusion is open to doubt.

Despite these limitations, the ICD system for gathering data on cause of death of the world's population is still a worthwhile endeavor that generates useful and important epidemiological data that can guide prevention policies and focus prevention programs. Recent publications of data and reports from WHO have included information on the reliability of the data, data collection systems, as well as an indication of the sophistication of the data-gathering infrastructure available in each individual country.

Manner of Death and Equivocal Death

In many jurisdictions, the cause of death statement will be followed by a legalistic conclusion of the manner of death. Manner of death is a simple form of classification of all deaths into one of the following: natural cause, accident, suicide, homicide, and undetermined. This delineation allows

epidemiologists and researchers to focus on specific types of deaths that they may be interested in. For example, changes in the pattern of deaths due to traffic accidents may lead to studies by car manufacturers and road designers to improve safety as well as efforts to modify dangerous driver behaviors such as speeding or driving under the influence of alcohol or drugs through education efforts as well as regulations and penalties for offenders. Deaths by suicide may inform on the state of mental health and the provision of mental health treatment in a community. It may also be useful for determining the presence of social ills and welfare needs in a community.

The determination of the manner of death is an "official" pronouncement; as such, it can have far-reaching consequences and effects on the surviving family members of the deceased, on the estate of the deceased, on the insurance claim and payout, and, perhaps more importantly, on the reputation of the deceased and his or her family. To illustrate this, consider the death of a person by hanging. Instinctively, one would be inclined to suggest that the manner of death was suicide. However, this determination can only be made if a full investigation has excluded sexual misadventure or homicide by suffocation or by intoxicating agents staged as a hanging death. Investigation of the scene of death is crucial in such cases; the manner of death may not be thought of as a suicide if sexual aids, bondage, and restraint equipment were found to have been used. Here, the possibility of an accidental death due to sexual asphyxia during sexual play or experimentation would perhaps be a more accurate assessment and conclusion of the manner of death.

Families frequently find the suggestion that death was a result of sexual asphyxia unacceptable. Such a manner of death determination often will be legally challenged. A finding of suicide to appease the family would be incorrect and can lead to prolonged civil action from insurers. In other cases, the impact of religion may also be a strong determinant for objection to the manner of death if labeled as suicide. Even a finding of natural death can result in prolonged angst for the family, if they believe that death was a result of a medical mistake or negligent care. Declarations of homicides too are not immune to challenge as they may lead to accusations of official persecution or outcries of failures of the law enforcement agencies.

Despite such issues, determination of the manner of death is generally straightforward. In many jurisdictions such determination is made by the coroner or medical examiner or perhaps an investigating magistrate. In the coroner's system that exists throughout the British Commonwealth countries, a jury is convened for assistance in determining more difficult cases as an aid to the coroner.

Changing Trends in the Causes of Death

The ICD system provides policymakers, health practitioners, and scholars with reasonably reliable information on changes in patterns of diseases within a country or within regions of the world. WHO data for the year 2007, for example, show that the causes of death are very different between countries that are developed, developing, and underdeveloped. The leading cause of death for countries with high per-capita incomes, such as the United States, is coronary heart disease. Other lifestyle-related diseases in the top 10 list for 2007 include chronic obstructive airway diseases, stroke and cerebrovascular diseases, and diabetes mellitus. Cancers of the lung, breast, colon, and stomach also were in the top 10 lists. In countries with low per-capita income, the leading cause of death is also coronary heart disease. However, infectious diseases such as HIV/AIDS, malaria, tuberculosis, and diarrheal diseases are among the top 10 causes of death. Perinatal conditions and road traffic accidents also are among the top 10 causes of death in countries with low per-capita income.

When studied over time the top 10 causes of death offer a unique view of developing trends, suggesting the need for health care resources in different communities. The trend appears to suggest that lifestyle-related diseases are affecting even the low-income countries, where the effects of a modern idle lifestyle is quickly catching on. Similarly, the prevalence of traffic fatalities reflects inadequate attention to good roads, well-maintained vehicles, and driver and pedestrian awareness of the dangers of their actions. The clear absence of infectious diseases in the list for countries with high income clearly illustrates the need to make resources available for the treatment of infectious diseases, as they are so infinitely preventable.

Finally, the study of lists within a country also can provide a good overview of the successes or failures of health care policies. Data from the U.S. National Vital Statistics Reports showed that the top 15 causes of death in the period from 1999 to 2005 have remained the same with the exception of a change in position between homicide and Parkinson's disease. However, the actual rates of death by homicide have gradually risen from 6.1 deaths per 100,000 population to 7.3 deaths per 100,000 population.

During this same period the death rate from heart diseases decreased from 259.9 per 100,000 population to a figure of 220 per 100,000 population. Some decrease in deaths resulting from malignant cancer also can be observed with the rate declining from 197 to 188.7 per 100,000.

The rise in accidental deaths provides a more somber conclusion for the increases recorded in the number of deaths due to accidents. Deaths associated with Alzheimer's disease also increased from 16 per 100,000 to 24.2 per 100,000, an almost 50% increase in the 7-year period. Such vicissitudes in the nature of death-related data are suggestive of important dynamics. Hence, cause-of-death data, although subject to complex systemic problems and recording procedures, provide a holistic perspective and assist in directing future attention to emerging areas of public health concern.

Causes of Death, Historical Perspectives

Through time there have been significant changes in the major causes of death for human populations. The major causes of death have changed from infectious and parasitic diseases to chronic conditions, such as heart disease and stroke. Numerous factors have influenced the changing causes of death, including nutrition and diet, personal hygiene, exposure to new environments or contagions, public health measures, changing perceptions of the causes of disease and illnesses, and medical advances and discoveries. With the historical changes in causes of death has come an increase in average life expectancy, particularly during the 20th century.

This entry outlines some of the major historical trends in causes of death, primarily for the United States, as well as the factors that are associated with such changes. The first section discusses the sources of data available to conduct a historical study of causes of death. The next three sections examine major causes of death during the colonial period, the 19th century, and the 20th century. The final section examines early 21st-century trends with a view toward future causes of death.

Data Sources and Data Quality

Records of death rates, causes, and differentials are limited in coverage for the United States before the late 1800s. Thus, information about mortality trends from colonial times until the mid-19th century is based upon data collected in smaller geographic units, such as cities or reporting states. Much of the early information about deaths was derived from personal journals, diaries and letters, newspaper accounts, or other public records. Deaths were not regularly reported or recorded in all areas, and this was particularly true of infant and child deaths. Church records and family histories can provide information about births, marriages, and deaths; however, much of the information is missing, somewhat inaccurate or incomplete (such as infant deaths occurring before baptism), or not analyzed in a systematic fashion.

The decennial census, beginning in 1790, established an important source of demographic data.

However, mortality information was not collected in the census until the mid-1800s, and the information was not consistently recorded in the public record. Individual states and the federal government were slow to develop vital registration systems to record demographic events, such as marriages, births, and deaths. In 1900, the federal government began publishing annual mortality statistics, based upon the newly established death registration system. The initial death registration area included 10 states, the District of Columbia, plus 153 cities not in the death registration states. Through the years additional states were included, and by 1933 the death registration system covered all of the United States.

Colonial Period Mortality Trends, 1600–1800

During the colonial period the major causes of death were primarily infectious diseases. Regional differences in death rates across colonial America were due to differences in rates of disease transmission and survival, immunity to disease, and the methods used to treat or prevent the spread of disease.

From 1600 through 1775 smallpox was a major cause of death in Europe and North America. A highly communicable viral disease, the smallpox virus typically is passed from host to host, but it also can remain infectious for months on inanimate objects, including bedding and clothing. Once infected, the person either dies or survives with a long period of immunity. In the urban areas of the Old World—Europe, Asia, and Africa—children were most likely to contract smallpox, and thus, adults were typically immune to the disease. Smallpox was brought to the New World from Britain and the West Indies, and outbreaks were highest in the port settlements, such as Charleston, South Carolina, and Boston, Massachusetts, where new immigrants arrived. Because the arrival of trade and passenger ships was not on a regular schedule, the outbreaks of smallpox were erratic. The periodic smallpox epidemic affected all ages, because the adults living in the colonies were less likely to be immune.

The smallpox death rate was lower in colonial America compared with that of Britain. A factor contributing to the lower colonial death rate was the introduction in 1720 of variolation. An early form of inoculation, variolation was the application of pus of an infected person to an incision in a healthy person who contracted a mild form of the infection, in turn building immunity against the deadly smallpox.

Another infectious disease that affected the colonists in coastal regions was yellow fever. Originating in Africa, the disease is spread by mosquitoes thought to have bred in water barrels on slave ships arriving in the Americas. The first outbreak of yellow fever is thought to have occurred in Boston in 1693 imported by a British ship from Barbados. Then, during the 1700s, yellow fever emerged in New York, Philadelphia, and Charleston on several occasions; New Orleans experienced an initial outbreak in 1796.

Yellow fever represented a puzzling disease because infected colonists who moved to new locations did not spread the disease, and the disease inexplicably disappeared during cooler months, particularly in the northern regions. The relationship between mosquitoes and the transmission of diseases such as yellow fever was speculated; however, the causal relationship was not verified until the end of the 1800s. Other infectious and contagious disease endemics during the colonial period included malaria and dysentery. Respiratory diseases such as pneumonia, influenza, and respiratory infections, as well as typhoid fever, typhus, diphtheria, scarlet fever, measles, whooping cough, mumps, and venereal disease had an effect upon the death rate.

Other causes of death were the result of infection associated with cuts, amputations, and other medical treatments during colonial times. Death also occurred due to the lack of adaptation to a new environment. It is estimated that in the southern colonies during the 1600s as many as 40% of the new arrivals did not survive the first year.

Native American Mortality Trends

Few serious epidemic diseases were evident in North America before European settlement. One reason is the fact that there were no large dense population centers to transmit and sustain epidemic diseases. Another reason was that Native Americans had fewer domesticated animals; thus it was less likely for infectious or contagious diseases to transfer from animals to humans. A number of

Old World contagious diseases can be traced to this animal-to-human transmission.

Before European colonization Native American deaths were caused by famine and nutritional deficiencies, warfare, parasites, and infectious or contagious diseases such as tuberculosis, influenza, and syphilis. The arrival of ships from the Old World brought new diseases to which the Native Americans had never been exposed, including smallpox, typhoid, diphtheria, scarlet fever, whooping cough, pneumonia, malaria, and yellow fever. The Native American populations were decimated by the introduction of these new diseases, particularly during the 16th and 17th centuries.

Colonial Response to Infectious Disease Epidemics

Epidemics were frequent and disruptive to life in general. Public offices were closed or meetings were moved to areas outside the affected urban centers. Colonial laws were enacted to quarantine persons with contagious diseases for periods of 10 to 12 days for newly arrived ships to monitor for potential diseased passengers. Residents who were infected with contagious diseases were required to be quarantined at home or in establishments such as "pest houses" to be isolated from the general population. Many persons felt infectious and epidemic diseases were God's punishment for sinful ways, and it was not uncommon for public and/or religious officials to call for a period of prayer and fasting to appeal to God's grace to stop the further spread of disease and death.

New England had the lowest death rates and the South had the highest. The mid-Atlantic colonies had death rates similar to those in New England. The lower death rates in New England were due to the development and enforcement of strict quarantine laws, which reduced the spread of disease. The higher death rates in the South were due to the warmer environment, which was a breeding ground for mosquito-borne diseases, plus the arrival of larger numbers of immigrants who were not quarantined.

Colonial War Casualties and Deaths

Wars have been fought on American soil and there have been deaths on the battlefield as well as noncombat deaths to service members. It has been estimated that only 2% of the war deaths during the American Revolution were due to battle casualties. Hundreds of soldiers died of smallpox in the early years of the warfare so General Washington and others insisted that new recruits be inoculated; the inoculations reduced smallpox deaths. Filthy encampments, inadequate or unsafe food and water, and lack of immunity resulted in many soldier deaths due to infectious and contagious diseases such as typhus fever, dysentery, and pneumonia.

19th-Century Mortality Trends, 1800–1900

Infectious and contagious diseases continued to be the major causes of death during the 19th century. Smallpox was less of a threat due to the discovery by Edward Jenner in the late 1700s, which encouraged the use of safe cowpox virus vaccinations. But yellow fever continued to be a threat during the warm summer months, and periodically it reached epidemic proportions. Other infectious diseases such as typhus, typhoid fever, scarlet fever, and tuberculosis also were major causes of death.

The first cholera epidemic occurred in 1832, brought by immigrants from England. Cholera is caused by bacteria that are spread through feces-contaminated water and food. The filth and poor public sanitation, particularly in urban areas, caused cholera epidemics to occur from 1832 to 1873.

Death Rates During the 19th Century

Historical genealogical records and death registration systems are useful to approximate the increase in death rates during the 1840s and 1850s. With enhanced transportation technology during the 1800 to 1860 period, increased migration, and greater trade opportunities across the country, cities became larger and more densely populated, jobs shifted from farms to factories, and public school opportunities expanded. Such changes resulted in increased contact among people and increased human exposure to infectious and contagious diseases.

A number of the infectious diseases negatively affected the nutritional status of children, which meant that affected children did not grow and develop at normal levels. Nutritional deficiencies

and delayed growth and development during childhood also resulted in lower average weight and height during adulthood. Military medical records indicate that there was a decline in average height for men born during the 1820s until the latter part of the late 19th century. The records also indicate social class differences in height existed among Union soldiers from the Civil War era. Laborers measured the lowest heights while farmers had the greatest height advantage. By the end of the 19th century there is evidence of social class differences in mortality rates, with persons in the professional occupations having the lowest death rates while the highest death rates were recorded among laborers and servants.

The Civil War was the most deadly in terms of battle casualties. It has been estimated that 6.3% of the Union soldiers and 7.1% of the Confederate soldiers died in combat. Infectious and contagious diseases also added to war casualties due to unsanitary conditions, inadequate food and clothing, and lack of immunity, which resulted in deaths from intestinal disorders, respiratory diseases, and other diseases such as measles and tuberculosis, particularly for Confederate soldiers.

After the Civil War, death rates decreased due to an enhanced standard of living that included improved diet and more adequate shelter as well as improvements in public health. In 1854, John Snow identified a public water pump to be the source of an epidemic of cholera in the city of London. Later discoveries about bacteria and other sources of contamination led to the important introduction of water filtration systems and the addition of chemicals into the water to destroy bacteria. Public works and public health reforms led innovations such as in Boston and New York City where aqueducts for piping fresh water were built prior to the Civil War. By the end of the 19th century many urban areas had established such public works programs. The result was a lowered rate of death in urban areas.

20th-Century Mortality Trends, 1900–2000

The advent of the 20th century was witness to dramatic improvements in death rates. In 1900, the crude death rate, which is the number of deaths per 100,000 persons, was 1,719. By 2000, the crude death rate had decreased to 874 deaths per 100,000 persons. However, there were events that occurred to affect the still high death rate. The 1918 worldwide influenza pandemic, for example, has been compared with the black plague of the 14th century in terms of human lives lost, resulting in the anomalous increase observed in 1918, for which the death rate increased to 1,810 per 100,000. But, overall, the declining death rates resulted in an increase in average life expectancy. In 1900, the average life expectancy at birth was 47.3 years; by the year 2000, life expectancy had increased to 77.0 years (74.3 for males; 79.7 for females).

The declining death rate was the result of a decrease in the affect of infectious disease, particularly influenza, pneumonia, and tuberculosis. The declining death rate due to infectious disease continued during the second half of the 20th century until about 1980 to the mid-1990s during which time the affect of HIV/AIDS is noted.

The Changing Focus in Cause of Death

The remarkable decline in infectious disease deaths during the 20th century was due to the application of scientific advances achieved during the late 19th century, including widespread public works programs and cleaning up streets and public areas to control the spread of disease. Implementation of quarantines for contagious disease, the use of vaccinations and antitoxins, enactment of standard procedures for handling food products, elimination of public access of dangerous medications through the establishment of the Pure Food and Drug Act of 1906, and stricter licensing of medical practitioners enhanced public awareness and government governance. The creation of germ theory by Louis Pasteur in the 1860s and the introduction of safe surgery at Johns Hopkins University led to further improvements in public health and a lessening of the effect of infectious disease.

With the decline of infectious diseases a concomitant change in the major causes of U.S. death also occurred, shifting in the early portion of the 20th century to chronic disease. Deaths due to infectious diseases declined, while heart disease became the leading cause of death starting in 1910, and in 1930 cancer emerged as the second leading cause of death. The death rates due to heart disease

were highest in the 1960s and 1970s; however, since that time the number of heart disease deaths has been declining.

During the second half of the 20th century medical research focused on chronic conditions, which led to increased awareness of disease causes and symptoms. A result was improvement in medical tests to detect early onset of numerous diseases, including heart disease and various cancers, as well as tests for genetic predisposition for certain degenerative and chronic conditions. Medications were introduced to treat or control the progress of chronic diseases such as high cholesterol and hypertension. Research also emphasized the influence of lifestyle factors, such as smoking, high-fat diets, and exercise on greater risks of early death.

The development of germ theory and the practice of preventive medicine and better sanitation also had an effect on reducing noncombat-related deaths due to infectious and contagious diseases for American soldiers at war during the 20th century. However, during World War I, the rate of noncombat deaths was high due to the 1918 worldwide influenza epidemic at the end of the war. The discovery of penicillin in 1943, and other antibiotics, also reduced nonbattle casualties for soldiers in World War II and later wars.

Differences in Mortality Rates

In the first half of the 20th century, mortality rates dropped for all ages—but most notably for infants, children, and young adults—as a result of the reduction of infectious and contagious diseases. Since the late 1960s death rates have declined rapidly for persons age 65 years and older due to medical advances in diseases of old age.

Females have longer life expectancy, and thus, lower death rates than males, although the gap has fluctuated over the past century. At the beginning of the century the gap was small (approximately 2 years) due to females' vulnerability to infectious disease and high rates of maternal mortality (i.e., deaths during pregnancy and childbirth). Female deaths due to infectious disease declined in the first two decades, although maternal mortality deaths remained high until the mid-1930s, primarily due to no or inappropriate care for birth complications. Maternal deaths declined from 1936 (582 deaths per 100,000 live births) to 1956 (40 deaths per 100,000 live births) due to the growth of obstetric care, the use of antibiotics to fight infection, more appropriate methods to deal with delivery complications, and the use of trained midwives for home births. The gap in male–female life expectancy widened until the mid-1970s because of increased male disadvantage in deaths from heart disease and cancer and declining rates of maternal deaths for females. The narrowing of the gap at the end of the century occurred with greater male improvements in deaths due to heart disease, cancer, suicide, and homicide.

There were great differences in death rates by race at the beginning of the 20th century, with average life expectancy at 47.6 years for whites and 33.0 years for nonwhites. By 1970, data were routinely collected for mortality statistics for African Americans. At this time the black–white gap in life expectancy yielded a 7.6-year advantage for whites. By the end of the century the gap had narrowed to 5.7 years with black average life expectancy at 71.9 years and 77.6 years for whites. The improvement in African American life expectancy has occurred due to declines in death rates for homicide, cancer, stroke, and HIV disease.

Black–white differences in infant death rates, which is the death of infants before their first birthday, also accounts for the life expectancy gap by race. Early records indicate that in 1916 the black infant death rate was 184 per 1,000 live births, whereas the rate for whites was 99. By the year 2000 the gap between blacks (14.0 deaths) and whites (5.7 deaths) had gotten smaller; however, the rate of black infant deaths was 2.5 times larger that that for whites. Much of the black–white infant death rate gap has been attributed to socioeconomic factors, such as mother's education and income; mother's health; access and use of prenatal health care; and birth outcomes, such as low birthweight.

The 21st Century and Future Causes of Death

The first 5 years of the 21st century have yielded a continued decline in death rates in the United States, particularly for persons over the age of 65 years. Total life expectancy in 2005 was 77.8 years. The male–female gap has decreased to

5.2 years (75.2 for males; 80.4 for females) and the black–white gap has decreased to 5.1 years (73.2 for blacks; 78.3 for whites). With increases in life expectancy and age of death, there have been some changes in the causes of death in that diseases that are more prevalent in the oldest ages, such as Alzheimer's disease and other dementias, are becoming more prevalent as causes of death. Another trend that will affect future causes of death is the growing prevalence of obesity across all age groups, particularly in the United States. Obesity has been linked with greater rates of diabetes, stroke, heart disease, and certain types of cancer, so increases in death rates most likely will occur in the future.

The United States has experienced one of the largest waves of immigration in its history, and there have been concerns about immigrant health. The majority of the recent immigrants have come from poor countries in Latin America and Asia, and many are in poor working conditions such as manual labor and are experiencing exposure to harmful agents such as pesticides and other chemicals. Poor immigrants are less likely to have access to adequate health care and are less likely to be immunized. Such factors may lead to increasing death rates at younger ages.

Although deaths due to infectious and contagious diseases declined precipitously during the beginning of the 20th century, by the end of the century there emerged new, more lethal infectious diseases, such as Legionnaires' disease, HIV/AIDS, Ebola virus, and severe acute respiratory virus (SARS) in addition to more drug-resistant strains of diseases such as malaria and tuberculosis. Factors that have led to the resurgence or spread of infectious diseases include greater travel between the Western world and remote or third world countries where there has been increased urbanization and overcrowding. In addition, the increased use of antimicrobials in food additives for animal production has led to resistant strains of *E. coli*, *Salmonella*, and other contaminants in food, air, and water, which have caused deaths and other health concerns.

Finally, climate and environmental changes are going to have an effect on all populations. The Western world is not immune to such changes, as evidenced by the effects of hurricanes, heat waves, and other natural disasters. Climate and environmental changes are going to have effects on food and water supplies, as well as other resources, which will ultimately affect death rates.

Cemeteries

It was Elias Leavenworth who, in 1859, identified the cemetery as "the last great necessity" for his community, and for most of history it has been seen as such. However, globalization and the growth of new immigrant and ethnic communities from cultures and religions with divergent views about death and the dead are similarly manifested in divergent burial practices.

The word *cemetery* is derived from the Greek word for sleeping chamber, as the ancient Greeks believed that the dead were temporarily resting, awaiting the Day of Judgment when chambers would be emptied. Cemeteries are differentiated from other types of burial sites, such as graveyards

or churchyards, pauper's fields, mass graves, pantheons, or burial grounds. Modern-day cemeteries and memorial gardens are large parks for the interment of the dead and, unlike graveyards, are not attached to churches. They often represent a place for ritualized burial needs for a distinct community or culture of peoples. Their internal layout is ordered so that entire families can claim and control grave spaces. They tend to be secular, municipal entities serving a geographic region, community, ethnic group, or religious group. In the United States, due primarily to health concerns in the 17th century, cemeteries were located on the outskirts of towns. Today, space limitations force cemeteries outside of heavily populated urban areas.

Historically, cemeteries were central to community life and to the continuity of families, functioning to provide a physical place where people could visit, remember, and pay their respects to the dead. The significance of the cemetery in today's mobile and diverse societies is more complex, and it is not unusual for families to bury their dead and never return to that burial place. Alternatives to burial, primarily cremation, changing attitudes about death, and changes in the cultural symbolism of cemeteries all suggest evolving cosmological belief systems such as John Stephenson identified in his ages of sacred, secular, and avoided death.

American Cemeteries and Christian Traditions

In the United States the evolution of cemetery practices and the shifting meaning of death can be traced to the early colonial period, when cemeteries took the form of church or town graveyards and iconography encompassed an age of sacred death. Prior to the mid-1600s there is no indication that the New England Puritans marked the graves of their deceased, but by the 1660s the practice of grave marking was widespread. James Deetz documents that stonecutters used three basic designs: death's heads, winged cherubs, and a willow tree overhanging a pedestaled urn. Death's heads were most common from the 1680s to the mid-1700s. In the same genre were carvings that emphasized the flight of time: the hour glass, a scythe in the hand of death or father time, skeletons, crossbones, and death darts. Death heads tended to become less severe during the early 18th century, metamorphosing into a pleasant cherub or angelic image. Some carvings began to use background designs of foliage, grapes, or hearts that softened the presentation of death. Verses of consolation and lines of poetry conveying a message of hope also began to appear. Increasingly, death was portrayed as benign sleep. The new gravestone art symbolized optimism, depersonalization of death, and a new interest and appreciation for nature. The optimism reflected changing religious beliefs from the Puritan doctrine of predestination to the notion that in Jesus Christ, individuals could find salvation that would ensure life after death. The willow tree and urn motif also marked the end of town graveyards of the colonial period and the rise of the modern cemetery.

Between the 1830s and the 1850s, reflecting a transition from sacred to secular death, American burial space was transformed from the urban decay reflected in city church graveyards to a natural garden park providing a resting place for the dead and a scenic sanctuary for the living. The rural or garden cemetery movement epitomized the view of death as a natural part of the life cycle. A growing, affluent class of new urban citizens attached increasing romantic importance to nature, embraced more liberal religious beliefs, and changed the prevailing attitudes about death. The new cemeteries were referred to as "rural," although in reality, they were located on the perimeters of large cities, designed to create a natural haven for repose as city dwellers became overwhelmed by the urban landscape.

Garden cemeteries, reflecting an age of avoided death, evolved further between the 1850s and 1950s into what we know today as lawn-park or memorial park cemeteries, functioning to separate the living from the dead. Encapsulated in the organization of memorial parks is a highly routinized and controlled perpetual-care private business with its concomitant specialized management of death by death professionals and attendants. Unlike the rural garden cemeteries, the memorial park no longer makes nature a central feature. Only evergreens are used, because the browning of leaves is a reminder of death. Individual ground markers of bronze or granite have replaced the older formation characterized by a large family marker and rows of smaller individual headstones. Reminders of death in epitaphs and symbolism are

minimized. Strict management principles regulate the architecture and upkeep of the grounds. Full-service and professional packages, including real estate, life insurance, burial insurance, pre-need planning, and promises of perpetual maintenance (all for a price) are incorporated. If efficient business strategies formed the economic base of memorial parks, then promises of Christian immortality, resurrection, and eternal life formed its cosmological package. With the emergence of lawn-park and memorial gardens, shifting attitudes about the meaning of death reflect what James Farrell describes as "the dying of death." Fast convenient services in a commodified and commercialized environment are part of a larger trend in separating Americans from the realities of death. Similarly, it was during this age of avoided death that cremation became more prevalent in North America.

Variations in Cemetery Traditions

Jewish Cemeteries and Burial Traditions

Establishing a community cemetery is one of the first priorities of a Jewish community, as cemeteries encapsulate a set of customs and traditions connected to the burial of the dead. According to Maurice Lamm, a cemetery is considered Jewish if the purchase contract identifies it as exclusively for Jews, the cemetery corporation forfeits any rights to removal of burial remains, and facilities for Jews and non-Jews have separate entrance gates. Jewish cemeteries are located all over the world in various states of preservation and disrepair. The Old Jewish Cemetery of Josefov in Prague is the oldest Jewish cemetery in Europe, having survived Hitler's army only because he intended it to become part of the Prague Jewish Museum of extinct people. Over 100,000 Jews are buried in this small cemetery with approximately 12,000 tombstones and graves sometimes layered 12 deep. The Jewish ritual of *Nichm Avelim* is intended to comfort the bereaved and to beckon mourners to return to society. During the *shiva*, the first seven days of a 30-day mourning period (*Sheloshim*), mourners assemble after the burial at the borders of the cemetery, forming row after row of 10 or more persons. This graveside ritual is repeated when the mourners return to the home of the deceased. It is also customary in Jewish cemeteries to place a *matzeivah* or tombstone at the head of the grave to honor the deceased. Rather than bringing flowers to the grave, it is customary for visitors to bring pebbles left on the tombstone as tokens that individuals have been there to visit and to remember. The origin of this tradition is unknown but according to some people, it dates back to biblical times when Jews, forced into a nomadic life, died wandering in the desert, their graves left behind with no one to tend them but protected under piles of stones. Another explanation links the tradition to the practice of shepherds who, in an effort to keep track of their flock, would place a pebble in their sling for every sheep. In placing a stone on the grave, a visitor offers the prayer that God will keep the soul of the departed in his sling.

Muslim Cemeteries and Burial Traditions

In Muslim tradition, earth burial for the deceased is prescribed and the dead are typically buried within 24 hours. In non-Muslim countries it is often difficult to find all-Muslim cemeteries or those that accept Muslims and provide a separate section for their burial. Where Muslim cemeteries or sections of cemeteries exist, they are often characterized by open areas of land with few markers and are not readily identified as cemeteries. Muslims typically do not use distinguishable grave markers and tombstones as is common in Christian cemeteries. Muslim traditions for burial of the deceased are simple but precise. As with Christians, Muslims believe that the soul of the deceased leaves the body, awaiting a final Day of Judgment and Resurrection (*Youm al Ghiyammah*), when all will stand before God, their good and evil deeds weighed to determine entry into paradise (*junna*) or hell (*jahim*). Muslims prefer a speedy burial and typically do not use embalming or coffins, unless required to by local laws. When coffins are required, a simple wooden box is used. Immediately upon death a two-stage cleansing ritual is performed with quiet reverence by same-sex family members. The body is arranged in a sleeping position, then wrapped in cloth, three layers for men and five layers for women. There is one exception to this preparation. In the case of martyrs (*shuhada'*) the body is not washed and is buried in the same attire worn upon death.

Muslim burial is typically a male activity. Women are not prohibited from attending the

burial, but in most Muslim societies women are not allowed to carry the body or accompany it to the grave site. At the burial site a prayer is offered for the forgiveness of the deceased soul, unless it is a child (who is expected to go directly to paradise). The body is lowered into a 4- to 6-foot deep grave; inside the grave is a narrower cavity referred to as the *lahd*. The body is placed in the lahd resting on its right side facing Mecca (the Muslim Holy City). The lahd is then sealed (the body is walled in) with mud bricks made from the soil used to dig the grave. Finally, the grave is filled and another prayer is offered. If a grave is marked, it is by a modest marker placed at the head of the deceased; its purpose is practical rather than symbolic.

Spanish-Mexican Cemeteries

Traditional community cemeteries still exist in some parts of the United States, most prominently in small towns, rural areas, and among some ethnic groups. Mexican folk cemeteries are a good example, representing the ancestral influence of Indians and Spanish Catholicism. *Camposantos* (Field of Saints) in the southwestern United States are characterized by crosses of wood or wrought iron; *cerquitas,* wooden or medal enclosures surrounding the individual or family graves; and *relicaritos* or *nichos,* to receive personal items, holy objects, or photographs. Family plots are not as commonplace in camposantos as in other cemeteries, and the spatial organization typically emphasizes the individual rather than the family. This may be a function of economic necessity as families purchase individual plots as needed but cannot afford the cost of larger, more expensive family plots. In Mexican cemeteries, or Mexican subdivisions of cemeteries today, the crosses are often painted or wrapped in bright colors. Vegetation is rarely planted and grass is often "scraped" from graves. Family and friends of the deceased freely express their emotions by creating personal grave markers, artifacts cherished by the deceased or believed to facilitate communication. Common grave decorations include handwritten notes, greeting cards, animated balloons, religious objects, coronas (wreaths), toys, canned drinks, and personal possessions. This means of remembering a loved one allows families to maintain a relationship with the departed and suggests an acceptance of death as an inevitable part of life. Many camposantos in the United States today are not being preserved. Yet for some traditional Mexican and Mexican American communities, All Souls' Day (November 2) is still a day for cemetery cleanings and a time when families, the community, and the church come together.

African American Cemeteries

Although Africans have been in the United States since the early 1600s, there is little evidence of their earliest burial sites, which have been ignored, built over, paved over, or simply lost to time for lack of permanent markers. Dating back to the 1690s, the oldest known burial ground for Africans in the United States was located in lower Manhattan near the poorhouse, the workhouse, and the debtor's prison. Thousands of Africans, and some African Americans, were buried there, in a site almost forgotten until 1991 when excavation began to make way for a federal office building. Excavation was stopped and, after much public debate, the six-acre burial ground received National Historic Landmark status. Segregated burial facilities appear to have been the rule both in areas that supported slavery (and later, legal segregation) and in those that did not. Few records remain of the customs surrounding slave burials. Whether there were open or secret ceremonies depended on the slave owner. If there were no designated cemeteries for slaves, gravesites were in secluded or secret spots, long since lost to time. Graveside services included a sermon or eulogy, followed by family and friends throwing dirt into the open grave. Sometimes the grave was covered with broken earthenware, commemorating the broken body lying beneath the soil. Perhaps a West African influence, seashells were also a common form of grave covering well into the 20th century.

In the 21st century, many African Americans bury their dead in the same cemeteries as whites, and there are no distinctions in the markers or the messages. Some segregated or largely African American cemeteries, however, remain to provide a history of how a segregated people buried and remembered their dead. These cemeteries provide members of a given community with both geographic and historical roots, manifested in annual "cemetery workings" that are a part of many community homecomings and family reunions, especially in the South.

Native American Burial Practices

Native American burial practices are diverse, reflecting the many different tribal customs and beliefs from which they emanate. Some tribes are known to have placed their dead on above-ground scaffolds or in trees from which bones were gathered and deposited in earth pits. Some tribes practiced cremation; other buried their dead in the floors of their houses, and some built spirit houses. Despite tribal variations, most practice burying valuables with the deceased, believing that if these are withheld, the spirit will return to reclaim them or the loved one will not be able to make a smooth transition into the spirit world. These artifacts have made Native American burial sites of interest to outsiders with varying motives. Memorial markers were rare in early Native American burial grounds, but today differences separating Native American burials and cemeteries are diminishing. Their gravestones honor the Native American and Christian or secular cultures. Differences that persist are among tribes that remain relatively isolated, their graves still draped with traditional tribal blankets and prayer ribbons attached to nearby trees. Some tribes still wrap the body in a blanket or a special skin robe secured with rawhide ropes before burial. Prayer ribbons or prayer sticks of bright colors are placed at the site of the burial to carry the deceased to the spirit world.

In recent years, it is the reburial of Indian remains excavated or exhumed by archaeologists, anthropologists, and government agents that has claimed attention. The reburial movement began in the 1970s, generated legislation in several states, and, at the federal level, culminated in the Native American Graves Protection and Repatriation Act of 1990. The legislation acknowledges that Indian remains are human remains and not archaeological resources; it prohibits further excavation of burial sites and requires that such remains be returned to the home tribes for burial.

Other Cemetery Practices and Postmodern Death

Although largely a relic of the past, fraternal-order cemeteries, or sections of cemeteries, are yet another way that some Americans and Europeans marked the end of life on earth. Most of the cemetery variations noted here are those associated with affiliations or identities of the deceased, some achieved and some ascribed. There are, of course, other groups worthy of study for how they express their unique culture and their philosophy of death (or life) in the way they bury their dead. By contrast, there are those buried in anonymity for lack of any affiliation or identity (e.g., those buried in potter's fields). Variables other than group identity, such as nature or geography, can also dictate how some bury their dead. For example, San Francisco's limited land base is responsible for Colma, California, becoming the world's only incorporated city where the dead outnumber the living. Colma, a suburb of San Francisco, was destined to become a necropolis when San Francisco prohibited burials within the city in 1902. Nature and culture apparently combine to account for yet another cemetery tradition—that of above-ground burials such as found in New Orleans, Louisiana, or Galveston, Texas, where floods washed out graves before the coasts were contained with various forms of levees and dikes. What began as necessity, however, has continued as the burial style of preference for many New Orleanians.

In the postmodern world the demands of death for family and community are diminished as funeral parlors, perpetual-care cemeteries, and crematoriums assume the tasks of disposal. Although the trend of separating the dead from the everyday world of the living originated in North America, the separation between the living and the dead has never been complete. If, as Stephenson contends, it is the historical character of the "event of death" that stimulates ceremonial response, in the form of memorialized ritual and material artifacts, then a strong case can be made that in the postmodern era, both traditional and new forms of memorialization exist side by side. Perhaps the most interesting example of contemporary cemetery practices is evident in temporary, drive-by, and makeshift memorials representing substitute cemeteries. In the wake of the age of avoided death, new forms of community expression suggest a collective social identity and, at times, a global identity, as in the passing of a beloved public figure. The events of death precipitating these new forms of expression are perhaps best described as a new age of "untamed death." Premature deaths, violent deaths, random killings, and the threat of terrorist activities have brought the realities of unexpected and early death into public consciousness. This qualitative

transformation in the meaning and significance of death has led many to embrace a renewed interest in the memorial ritual and relic. In the postmodern era of untamed death, traditional values have been renewed. Yet, while cemeteries remain the preferred last resting place for a majority of the population, they are no longer "the last great necessity." Death, while still sacred to some, secular to others, avoided by most, and untamed for all, today takes the final remains to diverse ends and forms.

Cemeteries, Ancient (Necropolises)

Originating from the Greek for "sleeping place," the term *cemetery* refers to a place designated exclusively for the burial of the dead. A large cemetery associated with an ancient city is termed a *necropolis* (plural *necropolises*, *necropoles*, or *necropoleis*), derived from the Greek *nekropolis*, meaning "city of the dead." Necropolises took a variety of forms, linked to the cultural context in which they developed, but all were designed to provide a purpose-built location for the disposal of the dead. The necropolis was an important element in the definition of the ancient city and, although many were located outside or away from the city of the living, they maintained an important role in contemporary society. Cemeteries associated with major ancient civilizations, including those of Egypt, Greece, and Rome, have been extensively excavated and their architecture, decoration, and material culture provide insights into the social and religious lives of ancient people.

Ancient Egypt

The cemeteries associated with successive Egyptian royal capitals remain among the most impressive of the ancient world. Belief in life after death was fundamental to ancient Egyptian religion and as a consequence elaborate tombs, furnished with worldly comforts, were built to protect the body and ensure a happy afterlife. The decoration of many tombs illustrates aspects of daily life or activities the dead hoped to enjoy in the afterlife. Food preparation, also commonly depicted, was believed to provide sustenance for the inhabitant of the tomb. Egyptian cemeteries were often sited on the edge of the western desert, a location linked not only to religious beliefs about the afterlife and the sun, but also to the need to preserve precious agricultural land along the Nile.

The earliest cemeteries were located in the north of Egypt, including the famous necropolis at Saqqara, 30 kilometers south of modern Cairo, which served the city of Memphis. It was here that the earliest known step pyramid was built for Djoser (ca. 2667–2648 B.C.E.), along with 16 later pyramids. The step pyramid developed as a more

elaborate form of the traditional flat-roofed rectangular mastaba tomb, with successively smaller mastaba-like structures being placed on top of one another. Such structures distinguished themselves and their occupants from the traditional mastaba, which continued to be built alongside the pyramids. During the Fourth Dynasty (2575–2467 B.C.E.) the stepped pyramid evolved into the more familiar pyramid, such as those at Giza. The pyramid of the Fifth-Dynasty Pharaoh Unas (2375–2345 B.C.E.) at Saqqara contains the earliest known example of the Pyramid Texts, the precursor of the New Kingdom *The Book of the Dead*, giving instructions for the afterlife.

One of the most famous ancient Egyptian cemeteries was located at Thebes, in southern Egypt. Dating predominantly from the New Kingdom period (ca. 1560–1085 B.C.E.), when Thebes lay at the center of a vast Egyptian empire, the necropolis was created on the opposite bank of the Nile to the city and housed the tombs of nobles, courtiers, and other officials. Prior to the New Kingdom, Egyptian kings favored elaborate monumental pyramids, which were designed to impress, but repeated tomb robbing led increasingly to the use of a secluded valley behind the necropolis, known today as the Valley of the Kings. This cemetery was composed of tombs cut deep into the rock with a single access passageway and no external structure. Once burial was complete, the entrance to the tomb was concealed.

Cemeteries played an essential role in Egyptian religious belief and culture. The fact that tombs were normally built of more durable material than the mud-brick buildings of the city demonstrates vividly the belief that the tomb was to be the eternal home of the deceased's spirit and should be virtually indestructible.

Ancient Greece

The ancient Greek necropolis was traditionally located outside the walls of the city and, from the 6th century B.C.E., intramural burial at Athens was officially prohibited. This was linked not only to a desire to avoid disease and religious pollution but also to the need to preserve valuable urban space, and many Greek cemeteries were consequently constructed along roads leading out of cities. The necropolis was particularly important for Greek urban society because citizenship was signaled through burial within a recognized cemetery. The emergence of differing forms of commemorative monument and grave marker reflect the role played by the necropolis in the social and political life of the city.

The Kerameikos, or Potter's Quarter, is the best-known cemetery of ancient Greece. Located to the northwest of the city of Athens, outside the Sacred and Dipylon Gates, this area contained potters' workshops and was the main production center for Attic vases, but from around 1200 B.C.E. it was also the site of an organized cemetery. During the Geometric (ca. 1000–700 B.C.E.) and Archaic periods (ca. 700–480 B.C.E.) the Kerameikos housed increasing numbers of complex grave monuments. Funerary vases (amphorae) known as *lekythoi* were used as grave markers during the later Geometric period, some achieving heights of 5 feet. The use of lekythoi continued during the 7th century B.C.E., but monumental earth mounds also began to be constructed over individual and family burials. More elaborate commemorative monuments, in the form of sculpted or painted stone stelae and inscribed epitaphs that displayed information about the deceased, became the prevailing form of grave marker during the 6th to 4th centuries B.C.E. On occasion freestanding statues (kouroi) were also employed as markers. Stone vases, which mimicked the lekythoi of earlier periods, continued the traditional custom of marking graves with vases. In 478 B.C.E. the Kerameikos was divided by a new city wall, into which many existing funerary structures were incorporated. State burials of heroes continued on both sides of the wall, including those of Pericles and Cleisthenes. The construction of mausoleums was prohibited in 317 B.C.E. by a decree designed to curb extravagance in funerary activities. Following this decree, graves in the cemetery were marked by small columns or inscribed square blocks of marble.

Ancient Greek cemeteries were a place for the celebration of funerary rites and the remembrance of the deceased, but they also played a vital role in social and political negotiations in the city. Commemorative monuments could be used to distinguish members of the community from one another, in terms of wealth, status, or identity.

Etruscan Italy

The cemeteries of Roman Italy owe much to their Etruscan antecedents, found at Cerveteri (ancient Caere), Tarquinia, and Volterra. The Etruscan necropolis was composed largely of chamber-tombs, partly cut into the rock and partly built of masonry, many of which were covered with large earthen mounds. Other, rectangular tombs stood alone or in groups, normally aligned with internal cemetery streets. The Banditaccia necropolis at Cerveteri (9th to 2nd centuries B.C.E.) provides an example of the organization and planning of Etruscan cemeteries, with tombs aligned on a regular street grid. The interior of an Etruscan tomb was sculpted in order to reflect the appearance of a house, and the stucco of the Tomb of the Reliefs at Cerveteri depicts the items of daily life that the dead required in the afterlife.

Ancient Rome

The ancient laws of the Twelve Tables legally prohibited burial within a Roman city or town so cities of the dead developed on the outskirts of urban areas. Like those of ancient Greece, Roman cemeteries were normally strung out along roads leading from the city; examples can be found on the Via Appia Antica at Rome and the Via dei Sepolcri at Pompeii, where tombs and monuments cluster along the edges of the road. Many expansive cemeteries retained the pattern of the Etruscan necropolis, with an internal network of streets. This can be seen at Ostia, and particularly in cemeteries of the 1st and 2nd centuries C.E., composed of groups of brick-built house-tombs, including those of the Vatican necropolis and Isola Sacra (near Ostia). Unlike their Etruscan counterparts, there was little control over the growth and organization of Roman cemeteries. All members of the community, regardless of rank, used the necropolis, and the spaces between monumental tombs were often occupied by burials of the lower classes. Competition for prime roadside locations exerted a strong influence over the development of the Roman necropolis, reflecting the significance of the city of the dead in negotiations for status and identity among the inhabitants of the cities of the living.

At Rome during the late 1st century B.C.E. the necropolis environment was central to elite competition, as individuals sought to create new and unique forms of monuments in order to advertise their wealth and social status. This led to the creation of tombs such as that of Gaius Cestius outside the Porta Ostiensis, which took the form of a marble-clad pyramid. These elaborate tombs developed in a political climate of competition during the late Republic, but the construction of a magnificent circular mausoleum for the new Emperor Augustus effectively put an end to elite competition within the funerary sphere. However, the Roman necropolis continued to be a place for expression as other members of the urban community grasped the opportunities it offered for display. This was particularly important for the freedman (ex-slave) population of the city who were particularly anxious to find an expressive outlet for their newfound citizenship, legitimacy, and economic or personal success. The cemetery increasingly became an arena for the ordinary people of the Roman world.

The Roman cemetery was not only a place for the display of status; it was also the place in which the dead were remembered through ongoing religious rituals. Roman beliefs concerning the afterlife were vague, and philosophical arguments for the absence of an afterlife competed with traditional beliefs that the spirit of the soul inhabited the area of the grave and required sustenance. Epitaphs plead with the viewer to remember the dead and reflect a widespread fear of oblivion and desire for remembrance. The cemetery was visited regularly, on the anniversary of the death and birthday of the deceased, and during annual festivals of the dead, such as the Parentalia (February) and the Lemuria (May). On these occasions the surviving relatives consumed banquets and made offerings to their deceased forebears. Tombs were regularly furnished with facilities to assist with these activities, including libation tubes, dining couches, wells, and ovens. The Roman necropolis formed a focus of activity throughout the year despite its relegation to the suburbs of the urban area, and ancient sources mention prostitutes, robbers, and witches frequenting the tombs after nightfall.

Overcrowding and pressures on burial space led to the excavation of the first Roman catacombs during the 2nd century C.E. These networks of underground galleries were furnished with niches (loculi) designed to accommodate inhumations.

The catacombs housed the burials of pagans, Jews, and Christians alike, and represented an entirely new form of public subterranean necropolis. Only later, during the Christian period, did this distinction become blurred, as the graves of martyrs became the focal point for religious worship. Eventually, the division between the city of the living and that of the dead disappeared completely, as intramural Christian basilicas across the empire became focal points for burial. The true necropolis, a space designated specifically for the dead, was replaced by the grave- or churchyard, which came to dominate medieval burial patterns.

Cemeteries, Pet

It has often been observed that most of what we know of early civilizations is based on their funerary artifacts. One wonders what inferences will be made by archaeologists in the future when discovering hundreds of pet cemeteries from early 21st-century America, some with owners interred next to their animals. Indeed, future archaeologists may collaborate with historians to explain how the emergence of pet cemeteries in the late 19th century and their proliferation in the late 20th century are the result of sociocultural trends. Interestingly, researchers will not find any mortuary attention being given to dead animals a century earlier because these geographies reflect new moralities toward nature and the animal kingdom as well as profound alterations in familial and friendship bonds.

As is the case for the human elite, pet cemeteries and memorializations originally were limited to the animal elite and to the elites' animals. Near the track of the Kentucky Derby at the Old Friends Thoroughbred Memorial Cemetery is the final resting site for the equine stars of the race track. Among those interred at the Kentucky Horse Park is Man O' War, whose 1947 funeral was attended by 2,000 mourners. Similar species exclusivity can be found in Tuscumbia, Alabama, where since 1937 can be found the Coon Dog Cemetery. Reserved for working canines, at the Broward Pet Cemetery in Plantation, Florida, is the Service Dog Resting Place, which houses the remains of seeing-eye, drug detection, and search-and-rescue dogs.

As there exist national cemeteries for military veterans, so too for their pets. At San Francisco's Presidio is a cemetery for pets of army families stationed there. Some claim it originally was a burial ground for 19th-century cavalry horses or World War II guard dogs. Nevertheless, for the last half of the 20th century until closing to new interments, it remains the final resting place of not only dogs and cats but parakeets, hamsters, lizards, and rabbits.

The animal elite have also been buried alone in small consecrated sites. Ham, the first chimp in outer space, is buried in the front lawn of the International Space Hall of Fame in Alamogordo, New Mexico. In the same state Smoky the Bear was interred beneath a memorial plaque in the Capitan National Forest. Mitzi, of television "Flipper" fame, is buried beneath a dolphin statue in the courtyard of Santini's Porpoise School.

North of New York City in the affluent areas of White Plains and Scarsdale is the Hartsdale Pet Cemetery & Crematory, which advertises itself as the nation's "first and most prestigious pet burial grounds." Established during the height of the

Gilded Age and Victorian sentimentality in 1896, this final resting place of over 70,000 animals promises to "help keep the memory of your pet alive." Among the creatures there buried is Chips, who served in a number of General Patton's campaigns and alone took control of an enemy pillbox by grabbing the throat of the gunner and terrifying five other occupants into surrendering. He is joined by less accomplished creatures from higher status households, whose memorializations could be perceived as examples of conspicuous consumption. Thorstein Veblen, in developing the ways in which the economic elite demonstrate their wealth, included the notion of conspicuous waste. Veblen's work was published at the turn of the 20th century, when new waves of immigrants were struggling to feed their families and having to bury their dead in pauper fields, and the rich were interring their dead pets beneath exquisite monuments.

But the nation's upper crust had no monopoly over the love for pets or the grief over their deaths. According to the International Association of Pet Cemeteries and Crematories (est. 1971), Hartsdale is currently one of 600 active pet necropolises in the United States—50% more than in the mid-1980s—most being species heterogeneous and less exclusive in terms of animal accomplishments and owners' social status.

Emulation of the affluent fails to account for the proliferation of pet cemeteries. Also involved is a changing relationship between humans and their animals. Perhaps these people considered their animals sacred, as did the Egyptians 3,000 years earlier, who mummified their cats like their pharaohs and buried them within their own cemeteries—or as the ancient Persians did in what is now Ashkelon, Israel, where archaeologists located a large cemetery filled with but one breed of a whippet-like dog, each with its own grave and all apparently having died of natural causes.

Funerary attention is given to select social bonds and the stories above indicate a profound change in our relationship with animals. Two generations ago people did not employ veterinarians for non-working creatures. Cats and dogs were more disposable. Times were different when individuals were economically dependent on their farm animals—people often knew how to assist with births and remove porcupine quills, for example. Animals had roles. They worked and they did not come into the living quarters, because animals were, after all, the sources of most human epidemics. Today, however, creatures are pets and serve as companions—and are even considered as family members by roughly half of dog and cat owners, according to a 2006 survey by the American Veterinary Medical Association.

The mortuary attention given to pets is also testament to Americans' failures to connect with others. One sociological study found that Americans had fewer close friends and confidants in 2004 than they did 2 decades earlier, with the average individual having but two people in whom they felt they could confide important matters. One in four had no close confidants. The social void is countered with pets, whose fidelity and companionship address the loneliness. Dogs have long epitomized such unconditional loyalty, symbolized by the Victorian saga of Greyfriars Bobby of Edinburgh, Scotland. So devoted was the Skye terrier to his master, John Gray, that when the latter died the dog kept vigil over his grave for 14 years, leaving only for a midday meal, despite attempts of authorities to banish him from the churchyard. The survival of love after death resonated with the sentimentalities and mourning customs of the era. A monument was erected to the canine with the inscription "Greyfriars Bobby—died 14th January 1872—aged 16 years—Let his loyalty and devotion be a lesson to us all."

The 2005–2006 National Pet Owners Survey by the American Pet Products Manufacturers Association found pet ownership was at its highest level, with 63% of all U.S. households owning a pet. The intensity of the bond was detected in a 2007 Department of Homeland Security study of the inadequacies of mass evacuation planning in the wake of Hurricane Katrina. Among the many failures of taking into account human nature, the study found many people refusing to budge if they have to leave their pets behind. An interview with a major San Antonio (Texas) funeral home revealed that roughly one quarter of its obituaries now include pets as survivors.

There's a new contract between pet and owner: The former is entitled to human quality-of-life standards, and it is the latter's responsibility to provide it. This relationship has been increasingly capitalized on by the service economy; in 2007, Americans spent over $40 billion on their pets—double

the expenditures of a decade earlier. Many employers now offer pet health insurance. Pet day care centers, whose fees rival those for child care, have sprouted across the country. According to the American Pet Products Manufacturers Association, 42% of dogs sleep on their owners' beds. With such financial investments and emotional connection, pet deaths amplify the sense of loss. Roughly one quarter of pet owners, according to the American Pet Products Manufacturers Association's 2007–2008 National Pet Owners Survey, intend to make some purchase to memorialize their pet. In 2008, Kates-Boylston Publications began its *Pet Loss Insider* monthly newsletter.

Pet owners' grief has traditionally been disenfranchised, producing a vacuum now addressed by a growing mortuary industry paid to recognize their grief and to address it with funerary paraphernalia developed in the funeral industry for humans. Initially pets were the recipients of adult hand-me-downs, such as the use of infant coffins. Now manufacturers make an array of such conveyances available and at considerable cost.

At a deeper symbolic level, underlying the proliferation of pet cemeteries is the blurring of boundaries between the cultural and natural orders. Traditionally these realms were perceived to be antithetical, the former set up in opposition to the threatening latter. Instead of being seen as a threat to human well-being, the natural order is presently understood as inseparable from the cultural, its creatures viewed with compassion and respect.

In 1993 and 1994, researchers of the National Opinion Research Center posed to random samples of American adults the statement "Animals should have the same moral rights that human beings do." Nearly 3 in 10 Americans either agreed or strongly agreed. As the moral rights of animals gain acceptance so too are their legal rights: 90 of the 195 accredited law schools in the United States offer courses on animal law. Thirty states have legally enforceable trust laws for pets.

These trends set the stage for the 2007 morality play involving a professional football player who, after considerable publicity, was imprisoned for promoting dog fighting. We view ourselves as a people having evolved from being spectators enthralled by bear-baiting and cock fights to stewards of animal welfare (an idea institutionalized in 1954 with the founding of the Humane Society of the United States) and agents of animal rights (state charters of the American Society for the Prevention of Cruelty to Animals and animal protection legislation appeared in the decades immediately following the Civil War). Given this new ethos, it comes as little surprise that the Church of St. Andrew, home to New York City's first pet cemetery, plans to open its human cemetery to creatures so that pet owners can be buried near their animals.

Cemeteries, Unmarked Graves and Potter's Field

Cemeteries are physical places where bodies are laid to rest according to the laws, regulations, traditions, and rituals of their particular culture or religion and, typically, according to the wishes of family members or next of kin. Most burial places are marked in some way for perpetuity, the simplest markers bearing name, date of birth, and date of death. Lost in this conception of cemeteries are an unknown host of individuals who over time have been laid to rest in unmarked and later unknown graves, sometimes in mass rather than individual grave sites. These dead are unidentified, unknown, or unwanted in death as they likely were in life. Unmarked graves result from one of two sources. The first includes various kinds of natural or man-made disasters that claim lives in such numbers or in such form that the dead cannot be identified, for example, wars, hurricanes,

floods, or fires, circumstances that can even dictate the necessity of mass graves. The second source of the unknown dead includes the outcasts of society or those who were so unimportant in life that they receive no notice in death. Such persons often die in public institutions, or their remains become public responsibility because they could not be identified or were unclaimed by family or friends, often for lack of funds needed to dispose of the body.

Some countries do not regulate disposal of the dead or may suspend regulations in times of national crises or disasters when bodies are buried in unmarked plots, sometimes in mass graves, or burned. In the United States and many other industrialized nations, municipalities or other levels of governance have found it necessary to maintain burial space for persons who die in their custody or care or whose remains are left to that entity by default. In keeping with the traditions of Europe and America, bodies have more often been buried than cremated, thus creating the necessity for public or paupers' cemeteries, sometimes known as potter's fields. The origin of the name is apparently located in biblical history as recorded in the Gospel of Saint Matthew (27:7). A contrite Judas, having betrayed Jesus, returned his reward of 30 pieces of silver to the chief priests who judged it illegal for "blood money" to be returned to the treasury. They decided to use the money to purchase a burial ground for "foreigners." The land purchased is thought to be a site in the valley of Hinnom that was a source of potter's clay and sometimes referred to as "the potter's field." Hence to the present time, public burial spots for the indigent or unclaimed are often known as "potter's field."

Potter's fields have become the final resting places of those whose remains were never identified along with those who died in prisons, hospitals, almshouses, workhouses, orphanages, in isolated medical colonies or other public facilities that warehouse individuals. Some of the first municipal or institutional cemeteries, both in the United States and in Europe, were pauper's cemeteries where graves were unmarked or the markers did not stand the test of time. In some cases, cities, prisons, or other public agencies keep a record book containing plot and grave numbers as well as such vital statistics as were known about the deceased: age (or approximate), date of death, cause of death, place of death, and date of burial. Pauper's cemeteries were located on public lands that over time were often claimed for urban growth or municipal projects and the graves moved. The City of New York, modeling practices in England, had one of the earliest Pauper's Fields in at least nine different locations before purchasing Hart Island in 1869. The island now contains over three-quarters of a million unmarked graves prepared and maintained by prisoners from nearby Riker's Island who, without rites, bury coffins three deep. Records are kept by name (if known), sex, date, plot, and section in the event of future exhumation. The only marker in the Hart's Island cemetery is a 30-foot high monument in the center of the burial ground engraved with a simple cross on one side and the word "Peace" on the other.

Historically, unmarked graves result from disasters and wars where the sheer numbers of the dead necessitate speedy, and at times, mass burials, for example, following the recent Asian tsunami in the Indian Ocean. Before rapid transportation, storage facilities for the dead, and DNA or other medical testing, war made the battlefield the burial ground for many soldiers. Even in battle, however, except perhaps the case of Indian massacres such as at Wounded Knee, South Dakota, in 1890, the United States has rejected in principle the idea of mass graves. As late as 1980, the Veterans Administration, in an effort to create space in national cemeteries, announced a plan to exhume the bodies of 627 unknown war veterans to be buried and memorialized in a mass grave. The plan was scrapped due to political protest.

Although the use of mass burials, unmarked graves, and pauper's fields is no longer widely practiced in most developed countries, historical circumstances related to disaster, marginalization, and poverty still dictate the burial of the unknown or unidentified dead in impersonal and anonymous ways. Pauper's cemeteries and battlefield memorials stand as monuments to a society's beliefs about death and represent at least a minimal acknowledgment of public deference to death as the last and great equalizer.

Cemeteries, Virtual

A virtual cemetery is a database search term identifying a wide range of cemetery-related interests on the Internet. They include cemetery locations, cemetery records, headstone photos, tours of local and historical cemeteries, burial sites of the famous, and online memorialization of the dead. Related sites deal with end-of-life controversies, consumer rights, death humor, genealogical information, unusual techniques of body disposal, and commercial services including rental caskets and help in composing a eulogy. An Internet search identifies over 250,000 sites on one search engine and over 7 million on another. More specifically, virtual cemeteries are sites at which survivors post online memorials and where family, friends, and the merely curious visit and leave comments. Posting a memorial at some sites is free, others charge a nominal fee, and typically there is an index or grid to help the user find a specific memorial. Judging by the number of visitors, virtual cemeteries are busy places. This entry describes a typical site, suggests reasons for the popularity of these memorials, and identifies those most likely to be memorialized on them.

Cyberspace Cemeteries

There are many cyberspace cemeteries with many thousands of posted memorials and millions of so-called reflections attached to them. Reflections for any one individual often number in the hundreds. There are many common features to these postings. Typically the site opens with a photo and a quote such as from an inspirational book. Several click-on buttons are used to direct the reader to a biography, perhaps a set of photos, and a section in which comments may be left by visitors to the site. Anyone can read these messages, but they are often required to enter a name, e-mail address, and location before posting comments. Some of these messages may be addressed to the family, some to the deceased, and others to the world at large. Many such comments pertain to the attractiveness and meaningfulness of a memorial, whereas others can best be described as narratives of shared grief.

Many who purchase online memorials check them regularly, even daily, to read the newest posting. In so doing, some users have discovered relatives they did not know they had and found friends long out of touch. Many say they learned new things about the deceased. An electronic community of family, friends, and strangers is thus created and, according to some site operators, these networks sometimes continue as old friendships are renewed and new ones formed.

Virtual cemeteries for pets are also common, and they are filled with memories and expressions of love as compelling as those posted for people. Like human sites, they contain commemorations, poems, and photographs, and, like human memorials, those for pets are funny, sad, and touching. The memorialized include cats and dogs, of course, but also turtles, birds, horses, and in one instance a collection of snails. Animals are as missed as people and in the electronic public square that a virtual cemetery is, their absence is as mourned as that of any person.

Explanations for Popularity of Cyberspace Cemeteries

There are various explanations for the recent popularity of these cemeteries. First, contemporary families are scattered and mobile, and e-mail and shared digitalized photos are a logical preliminary for those inclined to go the next step and create an online memorial. Second, more people now choose cremation and scattering ashes, a practice that leaves survivors without a tactile place to pay tribute, to communicate with the dead, or to imagine a loved one resting nearby but residing in a better place. Third, the heaven of the Western imagination has always been a utopia populated by beings immune to the effects of earth, air, fire, and water, and, appropriately, the texture of its cyber equivalent is a weave of ones and zeros, the lightest of conceptual particles, a suitably modern image for escape from the

degradation of physicality and decay. The seeming miracle of it, some have noted, is that as cyber presences, the dead can be addressed directly in the perfected electronic ether they inhabit. Technologically revolutionary, cyberspace is yet mythically and poetically familiar, a new venue for expressing traditional themes of hope, resurrection, and safety.

Content studies of memorial sites have shown that infants and persons under age 18 are common in the postings, their unexpected deaths apparently creating a special need to say something about them. The average age of memorialized adults is fairly young, 52, while the elderly, whose deaths are more expected, are less commonly listed. Men are more likely to be memorialized online than women, at some sites by large margins. Cancer and accidents are the most commonly cited causes, AIDS and suicide mentioned less frequently. The degree to which nonwhite communities are represented at these sites is unclear. Most postings address a general audience of readers, following the style of newspaper obituaries, although nearly a third are specifically addressed to the deceased. Those intended for the wider community usually are written in a "storytelling" style that recounts life events, adventures, employment history, hobbies, and the deceased's impact on the lives of others—the familiar "celebration of a life" of most eulogies. Messages directed to the deceased are more likely to be written by women and are in letter format, conveying personal information about the sadness of the author. Few of these postings deal explicitly with religion beyond expectations that the deceased is in heaven and well cared for. While memorial sites are places for family and friends to visit, they also attract those described in the literature as "disenfranchised grievers," lovers, partners, classmates, and coworkers. The participation of these people in shared memorialization has been notable in instances of death from AIDS. The web makes possible public mourning from sources families may not expect.

Memorial websites appear to generate real, if unconventional, communities. Those who log on to read a particular memorial frequently "wander" through the cemetery looking at other sites as well. Shared sympathies from strangers who have experienced a comparable tragedy are common, and they have led to online friendships, particularly among those mourning a child or young adult. According to one site operator, mothers who posted a child death or teen suicide subsequently organized themselves to scan postings for similarly suffering parents. E-mails of support and encouragement were then sent by the group. Virtualmemorials.com makes this relatively easy as a search through the reflections can be limited to specific categories of persons—infants, young children, teens, siblings, spouses, adult sons and daughters—enabling users to quickly find memorials to losses similar to their own.

Cyberspace Model of Grief

As sites of bereavement, virtual cemeteries are a new and vigorous phenomenon, and they exemplify a newer model of grief, one called "continuing bonds." The etiquette of grief in English-speaking cultures has historically favored emotionally contained, self-focused suffering. That view, in part a descendent of the theories of Freud and popularized by Elisabeth Kübler-Ross in her stage theory of grief, characterizes bereavement as therapeutic labor or grief work in which the bereaved are counseled to separate themselves from the pain of their loss and seek closure so they can "move on." Continuing bond theorists argue instead that grief is never really "resolved," and total separation from one's dead is not possible or even desirable. Rather, the bereaved do their grief work by reviewing what the dead meant to them while alive and, equally important, they do that in the company of others who also knew the deceased. The task is to create a new relationship in which the dead—as role model or perhaps as agent of values clarification—is part of the survivor's future. That can be done in private reflection, but communal exchanges with interested others are equally important. Monologues at grave sites, reports of ghostly sightings of the deceased, stories told and elaborated at family gatherings or in support groups, and reflection on how the dead would have responded to some new challenge are all acts that build a continuing bond. The therapeutic task is both private and social, consoling but also educational, and out of that a more nuanced picture of the absent individual emerges, an image richer than the memories of any one person. In a postmodern society lacking standardized rituals of

death, virtual memorials are one way of creating continuing bonds through an electronic community of web users who comment on one another's grief. The posted narrative of a life can be continuously expanded and revised, each contributor to the story bringing a slightly different perspective. No closure is needed as the story line is a continuing project, growing with each addition to the reflections page. Cyberspace enables grief work but in a new and still evolving way.

Cyberspace Religion

Virtual cemeteries are themselves embedded in a larger, and also recent, phenomenon, that of cyberreligion. The key illusion of cyberspace, according to some researchers, is that, like a god, the Internet is always available to the faithful. It hears (or at least absorbs) every request and, like a loving parent, gives singular, unwavering attention to each person's expressed needs. This conveys a quasi-mystical sense of omnipresence and timelessness, even mystery, which contributes to the hope that the dead really do receive the electronic messages addressed to them. Memorialization as restorative ritual is one subset of online religious expression, which includes the convening of spiritual communities, discussions of cyberheaven, warnings of the apocalypse, and appearances in cyberspace of religious apparitions. In this context, virtual cemeteries are not the isolated curiosities they might at first seem.

Dispersed families and geographical mobility are prominent features of globalization. So too is the decline of dominating religious traditions and their rituals for escorting the living from this life to one somewhere else. Virtual cemeteries are a response to these newer realities, congenial public places for reaching out to others, even to the dead themselves who live on as valued cyberpresences among the living.

Cemeteries and Columbaria, Military and Battlefield

Both cemeteries for the burial of the dead and columbaria for the preservation of cremated ashes shift their meaning in the context of conflict, especially those wars fought in the name of the modern nation-state. Within Europe, mass death far from home prompted a shift in commemoration of the dead of war, a militarization, in effect, of mourning practices that witnessed changes in the structures of civic cemeteries and the construction of national cemeteries and commemorative sites following the American Civil War (1861–1865), the Franco-Prussian War (1870–1871), and World War I (1914–1918). In the absence of bodies, new rituals focused on the meaning of the death, on sacrifice in the name of the nation, and on the extension of national sacred sites abroad, especially following World War I.

The problem of the absent body did not arise with World War I, and hardly terminated with it; yet it is that conflict that dominates, to a great extent, any and all discussion about battlefield death, its commemoration on the battlefield itself, in cemeteries proximate to or far from said battlefield, in columbaria—broadly conceived—and in monuments. Ever since Philippe Ariès identified World War I as the conflict that witnessed the peak of the "civic cult of the dead," scholars and popular writers alike have tended to interpret the response to death in battle in the context of the years 1914–1918, with the rituals attendant upon

soldier sacrifice as precursors to or developments from that war to end all wars.

Battlefields are contested spaces in more than one respect; military contests upon them are frequently followed by political conflicts over their transition from sites of military exchange to sites of mourning and, ultimately, to sites of memory. Although much of the controversy surrounding battlefields derived (and derives) from war's relationship to the nation-state, the message conveyed via war commemoration predates the formation of modern nations. Even in the 15th century, Europe's battlefields represented politically charged sites on which memorial chapels were erected to establish the power of the victor and control the memory of the vanquished. With the nation-state, of course, came more elaborate and more consciously constructed sites of memory, which encompassed both ritual responses to the sacrificial dead of war and architectural statements in the form of cemeteries and associated monuments of the power of the nation in whose name so many had died.

The pattern that many such commemorative cemetery sites followed echoed, in certain respects, the "rural" or "park" cemetery movement that emerged on both sides of the Atlantic in the early 19th century largely in response to the example of Père-Lachaise (1804) in Paris. London's Kensal Green (1833), the Glasgow Necropolis (1832), and Mount Auburn in Cambridge, Massachusetts (1831), offered the most notable early examples of the repositioning of death in a rural setting, one designed as much for the moral uplift of visitors as for the emotional succor of the bereaved. Furnished with guidebooks, visitors were encouraged to admire these new "gardens of graves," and to derive spiritual solace from them. This was a period during which the cult of the dead found its fullest expression, but in terms of the relationship between the dead and the living, it was also one that had lost the coherence of community. In this context, the rural cemetery movement did not merely satisfy emotional and moral needs but also served a nationalist, patriotic function. An important link was forged between the land in which the dead were buried and the mourners—a link that prompted both patriotic and personal responses. This found its fullest and most potent expression in the military cemeteries that were constructed following the American Civil War and, in slightly different form, in Europe after the Franco-Prussian War and World War I.

On the Altar of the Nation

Post–Civil War American military cemeteries presaged, in some respects, the national cemeteries of World War I, yet there are differences, alongside the overt visual similarities, in the responses to the dead in each case. What the American Civil War highlighted most clearly was a sea change in attitudes toward the citizen soldier, whose death in the cause of the nation provided a patriotic and political dimension to the ceremonial response to the fallen. The Napoleonic Wars in Europe had produced death on a mass scale, and common graves were often the final resting place for many soldiers. Such deaths did not go unacknowledged; indeed burial at all was regarded as better than the alternative of simply being abandoned on the battlefield, and the attempt within the ranks to provide a Christian interment for fallen comrades, however rudimentary, was testament to the importance accorded burial rites in this period. As in Europe, however, in America, most notably in the Mexican War (1846–1848), official ritual interment for the nation's soldier dead was neither feasible nor understood as necessary; although a memorial was later erected in Mexico City, the remains were, by that point, unidentifiable.

The Civil War witnessed a shift in the treatment of America's soldier dead, once it became obvious that the war would be neither brief nor relatively bloodless. Two months after hostilities commenced in 1861, the War Department stipulated that all deaths be properly recorded and graves appropriately marked. The following year, it was further stipulated that ground proximate to the battlefields be purchased in which to bury the dead. In 1862 alone, the federal government established no fewer than 14 national cemeteries, some at troop concentration points, some at prewar post cemeteries, others proximate to battlefields, such as Antietam and, most famously, Gettysburg. In fact Gettysburg was, from its inception, much more than a simple cemetery. At its dedication, statesman and orator Edward Everett—himself instrumental in the creation of Mount Auburn—emphasized the classical parallels between this New World ceremonial cemetery and Athenian precedent, specifically the law stipulating that

soldiers who fell in battle be accorded full honors and buried at the public expense. This set the tone not just for the symbolic shrine that Gettysburg would become but for the popular understanding of the role played by the Civil War dead in the nation.

The obvious parallels between Gettysburg and the form and development of cemeteries during the French Revolution and the wars of liberation and, later, World War I are not simply visual. The rows of identical grave markers were designed to symbolize the equality of the fallen in the republic, in America as in France, and became the style adopted for all national cemeteries in America, for American cemeteries to the war dead in Europe, and for many European cemeteries.

Gettysburg also followed the rural cemetery precedent, both in its form and in its function as a site of consecration for the land itself. As with rural cemeteries, Gettysburg became a tourist attraction, and visitors were encouraged to consider the power of the American republic in whose name the men interred there had died. The cult of the fallen Civil War soldier became a constant element in American sacred ceremonies and in the monuments erected over the years, not just in remembrance of the Civil War, but of other wars, too, most notably in the nation's capital. Washington, D.C., as Ariès pointed out, has become over time the central sacred site of the nation; an entire city suffused with the ghosts of the dead of war, the many memorials erected there—notably the Vietnam Memorial—are responded to as tombs, and treated appropriately, with flowers and mementoes inserted into the gaps between the slabs listing the names as they might be placed on an individual grave.

Contested Commemorations

Sites such as the Vietnam Memorial, which function symbolically as tombs but are absent bodies, represent a form of columbarium, but columbaria themselves have become more significant as sites of militarized commemoration in response not just to the growing numbers of war dead—and eligible family members—but to the right of all honorably discharged military personnel to have an official state burial. Military columbaria, in the United States, clearly reinforce the link between military service and national citizenship, and place the dead in a national, historical, and military context, as the national cemetery at Los Angeles, with its display of military uniforms, makes clear. In such cases, the issue is not absent bodies, but a reinforcement of the national body.

Military cemetery at Gettysburg

Source: Susan-Mary Grant.

In this context, one of the most contentious military sites of memory is the Yasukuni shrine in Japan, similar in some ways to sites such as Gettysburg in that it was a product of the modern nation-state, reinforcing patriotism by emphasizing that the war dead achieve both state and spiritual acknowledgment. Yasukuni functions within the framework of Japanese religious belief; although there are no bodies at the shrine, the spirits of the dead are understood to be present in a more tangible form than in any American or European memorial, and priests function as the intermediaries between the living and the spiritual world. The mutual dependence between the dead and the living at Yasukuni is therefore mediated through a belief system apparently absent in America and Europe; yet the difference may be more apparent than real, both in terms of the political and national controversies surrounding sites such as Yasukuni and, more fundamentally, in the naming of the dead as an intrinsic part of the ritualized representation of remembrance at war cemeteries, columbaria, and memorials generally.

Much of the controversy surrounding Yasukuni relates to the "burial" there of war criminals and, in a broader sense and partly through its associated museum, the shrine's perceived reinforcement of aggressive militaristic values inappropriate to modern Japan. Directly equivalent controversies may not attend other sacred sites, but the issue of who is commemorated, and to what ends, in war cemeteries and battlefield memorials informs the development and meaning of such sites worldwide. In Spain, the Valle de los Caídos contains the dead of both sides, Republican and Nationalist, from Spain's civil war, but the presence of Franco's remains dominates, diluting, to a degree, the reunification message intended by the construction of the basilica. After America's civil war, only the Union dead were interred in the new national cemeteries; the exclusion of Confederate dead was an understandable, but ultimately divisive, statement of national belonging. The separation of African American Union troops from white troops in such cemeteries sent a rather different message about citizenship and its costs, but a context-sensitive one; the corner of a foreign field that is forever America, namely the military cemeteries for the American dead of World Wars I and II, did not follow a similar pattern of segregation.

War cemeteries in general, Julie Rugg has argued, frequently recall the horrors of war rather more than the individual dead, but such a stark distinction between individual and national commemoration is misleading in the context of the wars fought by the modern nation-state. The evolution of many battlefields, such as Gettysburg, into National Military Parks in the later 19th century, and the concomitant growth of battlefield tourism in the 20th, particularly following World War I, blurs any clear distinction between the pilgrim and the tourist, the personal and the overtly political, and sacred sites cater to both. In the aftermath of American Civil War battles, noncombatants scoured the battlefields, many in search of the missing but others seeking to collect some *memento mori* in the form of a bullet, a button, or even a bone to take home. The strict regulations that are in place today to protect battlefield sites from relic hunters highlights the fact that if war has a price, it also has a value.

The value of the sacred sites of war, for those less materially inclined than relic hunters, lies in their liminality not just between the living and the dead but between the individual and the collective and, for many, between the homeland and the foreign field. For those whose family members died abroad and whose remains were not repatriated, for those whose dead were never identified, the name on the Menin Gate, the "Unknown" tombstones at Gettysburg, or the flimsy piece of paper at Yasukuni may condole as much as commemorate; in this sense the war cemetery, like the rural cemetery before it, provides personal space within a broader patriotic context, encourages rumination alongside remembrance, and positions both in an environment designed to contain and control the death, and responses to it, resulting from war.

Childhood, Children, and Death

The issues surrounding how children understand and respond to death have profound implications for their healthy development into adulthood. Multiple factors influence their cognitive understanding of death, including chronological age and developmental capacity. How well they will cope constructively with losses in childhood is a complex combination of internal and external forces, with important implications for professionals and parents.

Scholarly commentary on children's understanding of, and reactions to, death reaches back to the 1930s and 1940s, with the publications of Paul Schilder and David Wechsler, Sylvia Anthony, and Maria Nagy. How and when children develop a mature understanding of the finality of death, how their reactions and responses differ from those of adults, and what methodologies best accommodate them in healthy grieving are topics that have received increasing interest in the research and clinical communities in the past 3 decades.

Child's Understanding of Death

Most discussions of children's understanding of death begin with the models of childhood development of Erik Erikson or Jean Piaget and the characteristic tasks inherent in subsequent stages of development. It is generally accepted that by the age of 7 years, most children have a mature concept of death. It has long been thought that a mature concept includes the four components of (1) universality, the fact that everyone dies, that death is the inevitable end to every living being's life, and that it is unavoidable; (2) irreversibility, the understanding that once you are dead, you cannot come back to life; (3) nonfunctionality, that when people die they can no longer engage in biological activities like eating, talking, breathing, walking, or laughing; and (4) causality, that death happens because of certain and identifiable biological reasons.

More recently, two additional concepts have been proposed, by Lynne Ann DeSpelder and Albert Lee Strickland, and Mark W. Speece and Sandor B. Brent, respectively. Those concepts are personal mortality, the realization that "I will die too," and noncorporeal continuation, the nonempirical notion of some kind of existence beyond the physical.

From birth to approximately 2 years of age, corresponding to the sensorimotor period in Piaget's model of cognitive development, the child is developing senses and motor abilities and begins to build bonds with what John Bowlby referred to as the "mother-figure." Pioneering work on loss and attachment by John Bowlby and others about infancy and abandonment laid the groundwork for a clearer understanding of how deeply infants and very young children understand, if not *death,* at least *goneness*.

Piaget's preoperational period includes ages 2 to 4, a time of intense egocentric thought, and ages 4 to 6, when more socialization, speech development, and problem-solving abilities develop. During this time many children become curious about and interested in death, through the experience of insects and animals, cartoons and children's books, or the deaths of pets or grandparents. While struggling with a comprehensive understanding of the finality of death, it is not unusual for children this age to engage in "magical thinking," that is, the belief that their actions contribute directly to events that objectively they cannot control. They may believe they "caused" someone to go away and, subsequently, that they can "cause" the person to return.

Around the age of 7 through age 12, during what Piaget calls the concrete operational period, children's understanding of the death concepts is generally mature, though the operational tasks of this age provide a challenging time for incorporating the death of a parent or sibling into the normal growth experiences of building competency, comparing oneself to others, and valuing peer relationships.

Finally, entering the formal operational period at age 12, the adolescent's tasks and challenges of individuation and independence emerge in force, and peer relationships take on primary concern in the child's world. It is important to remember that coping with the death of a person who had a primary relationship with a child or adolescent—a parent, sibling, or close friend—is not an event but rather a process. The grief will be reexperienced throughout the phases and periods of the child's development and well into adulthood, when the early loss of a parent may become acutely experienced through pivotal events like graduation and other successes, dating, marriage, raising one's own children, and turning the age of the person who died.

Influences on Children's Reactions to Death

In addition to the child's developmental and chronological age and capacity for understanding a mature concept of death, other issues will influence how children respond to death. An important influence is the social context in which a death takes place. Bill Worden and Phyllis Silverman, in the Harvard Children's Bereavement Study results, emphasize that after a parent's death, one of the strongest predictors of how a child will cope is the emotional and mental health of the surviving parent. Other social factors influencing the child include what other support systems are available; how friends and peers respond; and what level of social engagement, belonging, and competence the child has through athletics, clubs, religious affiliations, and other activities.

The preexisting relationship of the child to the deceased is an important and often underemphasized aspect of how a child will cope. If the relationship was conflictual, death does not resolve the conflict; if the last communication between the deceased and the child was problematic, the possibility of resolving the relationship strain is no longer viable; and often, at all ages, children and adolescents often continue to believe that their behavior in some way contributed to the death. In cases where the child's actions contributed to the death, through an accidental shooting, for example, the normal complications of grieving may be exacerbated.

Other possible complications to how children may respond include witnessing the death, facing the stigma of suicide or violent death, dealing with the absence of a body, and all of the secondary losses that may accompany such a loss. These may include changes like moving to a new home, losing friends, questioning prior beliefs about God and the nature of one's personal safety, divorce, and shifting to a new school, among others.

Children's Versus Adults' Grief Reactions

Typical, normal responses to grief include emotional, physical, spiritual, relational, and psychological aspects. Emotions may include sadness, anger, relief, frustration, rage, guilt, and the full range of expression or repression of these, in accordance with the child's personality, intelligence, experience, and developmental age. Often young children in grief show regressive behaviors like bedwetting, crying when left, returning to wanting a bottle, or wanting to be held like a baby, though these effects typically decrease with time. Physical manifestations may include headaches, stomachaches, pains or aches for which no physical cause may be found, difficulties sleeping or eating, and conversely, overeating and oversleeping, as well as difficulty concentrating, staying focused, and attending to tasks. The experience of grieving may be isolating as adolescents withdraw from friends who don't understand or don't provide helpful consolation, and they often challenge and question assumptions made about personal safety, the meaning of life, and the existence of a benevolent God.

In a society that urges grievers to "move on" or "get over" grief, children's and adolescents' need for memorialization, meaning-making, and continuing bonds with the deceased are often overlooked by the adults around them. Additionally, growing professional interest in pathologizing the experience of grief has led to unrealistic expectations of the expected duration and intensity of grief symptoms, particularly among youth.

Whereas models for how adults grieve have proliferated and include tasks of grieving, phases

of grieving, as well as Elisabeth Kübler-Ross's much abused and overgeneralized notion of "stages of grief," models of how children grieve have relied, for the most part, on the developmental stages and periods of Piaget and Erikson discussed earlier. As a result, there has been a lesser understanding of the differences between how children grieve and how adults grieve.

Because children's expressions of grief are so intertwined with their understanding of death and their continuing developmental processes, integrating death into their lives appears to be an ongoing process, hence longer in duration than that of most adults. Additionally, children have less life experience and more limited developed means to make sense of death and often fewer tools with which to express themselves. They tend to be more sporadic in their grief responses than adults—that is, seemingly in and out of the intensity of feeling, one minute crying and the next wanting to join friends for a basketball game.

Parental Death

More research has been conducted on the impact of parent death on children than sibling or friend death, most likely because it is more commonly experienced. Most studies have been retrospective, and there is a wide range of research and practice-informed literature addressing the effect of early parental death. Because of the variety of factors influencing how children may respond to a parent's death as discussed above, it is impossible to conclude that all parentally bereaved children will suffer traumatic consequences as a result of the death. Numerous studies, however, refer to parentally bereaved children's increased vulnerability for risk of depression, anxiety, and relationship issues, among other symptoms. Conversely, psychologists like Richard Tedeschi and Lawrence Calhoun, who coined the term *post-traumatic growth* in 1995, point out opportunities for growth even among the most potentially traumatizing of events.

Sibling Death

Although the occurrence of sibling death in childhood is less frequent than that of parental death, and much less research has been conducted on the potential longer-term outcomes, it is generally agreed that the death of a sibling may bear a significant impact on surviving siblings. As with parental death, the response of the surviving parents is a pivotal influence on the surviving child or children. One aspect of sibling death that often heightens, as opposed to parental death, is the frequent sense of guilt among children that they were permitted to live while the sibling was not. Betty Davies has studied and written extensively about the long-term effects of sibling deaths in childhood.

What Children Need

In 1980 John Bowlby proposed four factors that facilitate a child's ability to mourn, and though they have been further expanded by clinicians throughout the years since, they remain a solid foundation from which to understand how to best assist children following a death.

The first factor, and the only one that cannot be retroactively controlled, is having a secure relationship with parents before the death occurs. Children who have experienced multiple losses, including divorce or abandonment, or whose lives include substance abuse, violence, physical abuse, and instability, stand at greater risk for future difficulties without that solid foundation of security, love, and support with which to manage living in the wake of death.

Second, Bowlby advocated that children fare better when they receive prompt and accurate information about the death. Often in an effort to "protect" children, adults do not share information honestly, especially if the death is a stigmatized death like suicide, AIDS related, or homicide. Children frequently attune to the reality that the truth is being withheld, they intuit from others that the story they have is not the full one, and/or they hear through other children or the media about the actual circumstances of the death. For these reasons, and because having the truth and not having to "fill in the blanks" allows children to begin to regain a sense of personal control, they should be told the truth by a trusted adult, as soon as possible, in ways that are developmentally appropriate and in language they can understand.

Participation in the social rituals around the memorialization of the life and disposition of the

body of the deceased is the third factor that facilitates a child's ability to mourn. Because a death inherently changes the lives of those mourning the loss of the person, having choices around designing and participating in rituals such as casket selection, funeral or memorial rituals, and where and how the body will be disposed help children feel a part of, rather than excluded from, these social networks and decisions.

Finally, Bowlby's fourth factor is having the comforting presence of a parent or parent substitute after the death. Studies of resiliency and children frequently refer to the importance of adult parent-figures or mentors in the lives of at-risk youth.

Robert Neimeyer, Daniel Siegel, David Crenshaw, and others have more recently placed emphasis on the healing power of meaning-making, in which children are supported in developing coherent narratives around what happened, and the meaning they derive from their experiences following a loss through death. An additional aspect of the meaning-making is the reality that change occurs in a social context; that is, our neurobiology is affected through the interchange with others.

Normal Reactions Versus Trauma/PTSD

Considerable focus by researchers and clinicians in the early 2000s has centered on the issue of trauma and post-traumatic stress disorder (PTSD). The diagnostic criteria refer to symptoms emerging from emotionally traumatic experiences, with three main clusters: intrusive and unwanted flashbacks or nightmares, in which the traumatic event is reexperienced; avoidance, such as when the person actively avoids exposure to people, places, or things that might trigger intrusive symptoms; and hyperarousal, evidenced as increased physiological arousal such as hypervigilance or a trigger-pin startle response. While it is generally accepted that early traumatic experiences may have long-term consequences, there is less clarity on what defines a traumatic experience. For example, some children exposed to violent deaths, suicide deaths, and/or other seemingly traumatic events may not show symptoms of PTSD or trauma, indicating that it is not the event itself, but rather, the perception and meaning-making of the event that engenders trauma symptoms. Judith Cohen and Anthony Mannarino coined the term *childhood traumatic grief* to describe the condition in which trauma symptoms interfere with a child's ability to engage in a normal grieving process, and this model implies the need for professional intervention to address the trauma aspect and symptoms and reduce the risk of future psychopathology. More research is needed to determine under what circumstances children experiencing loss through death may develop trauma symptoms, as well as the evidence for effective treatment models.

Research and Interventions

Increasing interest in possible long-term effects of unaddressed childhood grief has led to widely disparate stances on the efficacy of therapeutic interventions. In the early 1980s a burgeoning number of children's grief support programs developed, now numbering in the hundreds, networked through the National Alliance for Grieving Children. Significant contributions to the field of knowledge have been developed through the research of Phyllis Silverman and J. William Worden, Irwin Sandler and researchers at the University of Arizona, among others. Much more research, however, remains to be conducted, particularly on intervention methods. In a meta-analytic review of controlled outcome research in 2007, Joseph Currier, Jason Holland, and Robert Neimeyer were able to locate only 13 studies that included a control group and quantitative measures. One of the major obstacles to research is the lack of a well-validated measure of childhood grief.

Chinese Death Taboos

Chinese people share a long history of poverty, famine, disaster, plague, and political unrest where death was commonplace and the living had few, if any, effective ways of protecting themselves from it. Their anxiety and fear of death and dying are manifested in a wide range of taboo behaviors that are prescribed by traditional wisdom. Social anthropologists have suggested that death taboos and rituals have contributed to the homogeneity among Chinese populations both over the centuries and across oceans in the Chinese diaspora. These beliefs may be changing among younger, educated Chinese people, but on the whole they remain strong and influential.

The common taboos include not talking about death; having no contact with sick and dying people; avoiding proximity to coffins and dead bodies, including their clothing or belongings; and not mentioning the names of dead people for fear of calling back their spirits. Contact with family members of the deceased is avoided, as they are believed to be ritually polluted and the bearers of ill luck. In general, the curtain that divides the living from the dead in the Chinese world is flimsy and permeable and the belief in spirits and their capacity to affect the living for good or bad is widespread. It is not surprising that a varied and complex system of beliefs and rituals has developed to ensure that the dead stay on their side of the curtain.

Death Pollution

All mortuary rites are regarded as unclean, unlucky, and contaminated by evil, so the living must adopt precautions against their influence. Bathing after returning home from burial rituals serves to purify the living from the polluting effects of death. Blankets, clothing, and personal belongings of the deceased, as well as mourning outfits, will all be burned. These rituals of cleansing and the shedding of mourning clothes may also serve to control infectious diseases.

Corpses are thought to pollute everything and everybody in their vicinity, and this pollution and the ill luck that accompanies it can be passed on by secondary contact. Grieving family members are encouraged to stay at home and not to visit others' houses for 100 days after the death. Traditionally, a white (the mourning color) lantern would be hung outside a house where a death had occurred to warn passersby. This sense of being polluted and contaminated can mean that the bereaved become isolated and are denied comfort and support when they need it most. Ignoring the taboos means risking being blamed for the bad luck, illness, or death that may befall anyone with whom they have had contact.

Rituals to Reduce the Harmful Influences of the Dead

Natural deaths may lead to haunting and evil deeds by ghosts, even family members. A corpse, if kept at home, is placed in the sitting room with feet facing the door so that should it rise as a vampire, it will walk straight out of the door instead of harming family in the home. The date and place of burial are carefully selected for the salvation of the soul and to promote smooth reincarnation so that the spirits will move on. Offerings of food and spirit-money are made to appease any wandering spirits at the funeral. Elaborate funeral and mourning rituals dictate when to cry loudly, who to invite, what

to put into the coffin to accompany the corpse, music, religious chanting, dress codes of family members, and food to serve. Paper representations of worldly possessions such as mobile phones, cars, iPods, and clothes, for example, are burned so that they follow the deceased to the spirit-world where they will be available for his or her use. What these objects are depends on standards and content of consumption in that particular community. Ideally, grave sites should be carefully selected with good feng-shui that will bring luck, health, and prosperity to children and grandchildren. However, for many decades cremation has been officially encouraged in China because of the fear of losing arable land to burials.

Unnatural Deaths

Death without a proper burial is regarded as an eternal curse in the Chinese culture, as the spirit cannot be reincarnated. Unnatural deaths due to accidents, suicide, violence, lightning, and miscarriage are regarded as the consequence of past sins. Such deaths are a form of punishment for one's own wrongdoing or are seen as the sins of the ancestors being visited on descendants. Spirits resulting from unnatural deaths are believed to be particularly vicious, revengeful, and likely to kill to seek reincarnation. Corpses resulting from an unnatural death cannot be brought back home, and no funeral will be held. Their loved ones live with fear, despair, stigma, and social discrimination.

Taboo Words

The ancient Chinese believed that the spirit of a thing resided in the symbol or word that represents it. Thus people could be influenced by the utterance of words or the manipulation of symbols. A word is likely to be a taboo if it represents something that is regarded as sacred, dangerous, or contravenes the natural order.

Linguistic taboos have existed since the Zhou dynasty (1050–771 B.C.E.), that is, 3,000 years ago. *Death, illness, ghost, funeral, graveyard, corpse, grief,* and *death rituals* are all taboo words thought to bring bad luck. Even thinking about death may awaken harmful evil spirits. In consequence, it is difficult for Chinese people to prepare for death, both their own and that of others. Life insurance is also treated as a taboo, and the percentage of Chinese people who are insured is relatively small. Because many do not write a will, family lawsuits regarding inheritance of the estate are frequent.

Naturally, there are countless euphemisms for the word *death* in Chinese, for example, "gone to the West Heavens," "nailed the lid" (7 nails to seal the coffin), and "reported for duty (to the Emperor of Hell)." Homonyms also abound; the Chinese word for death sounds like the word *xi* (four); thus, the number four is taboo. Buildings often have no 4th, 14th (sounds like "sure dead"), and 24th (sounds like "die easy") floors in buildings, especially office towers, hospitals, and hotels. In traditional mourning rituals, 7 is the number for ghosts. Deceased persons should be served with seven dishes of food in offerings. He or she will return to their home on the evening of the 7th day after death. The spirit of the ghost will have to be reincarnated within 7 × 7 days (49). When Chinese prepare their meals or order dishes in restaurants, they will either have six or eight courses, never seven.

Even with a plentitude of euphemisms, Chinese are reluctant to talk about death or even illness, especially when the illness is life threatening or terminal. Thus, hospice or palliative care and advanced directives are often refused because it would mean thinking and talking about death. The family may be panicking and deeply distressed but will still be reluctant to discuss the issue of an advanced care plan with their loved ones.

Final Judgment in Hell

Everyone who dies must face the final judgment of the Emperor of Hell, flanked by his ox and horse-faced guards. All life's misdeeds will be punished before reincarnation can take place. Family members have to chant and burn paper offerings for the deceased to ensure that he or she can "buy their way through" hell and be reincarnated. The image of hell is much stronger than the image of heaven among the Chinese. The horror of death and the image of hell are firmly established in the minds of Chinese people because of Daoist (Taoist) and folk teaching. Stories of how human crimes are punished in hell and how good people become gods and are freed from the cycle of life and death are widely publicized through opera, songs, storybooks, and wall paintings. For example, if

one tells a lie, the tongue will be cut off; a person who commits adultery will be deep fried in a big pot of hot oil; individuals who beat their parents will be sawn in half. The punishments are terrifying, and it is probable that such stories were promoted to affirm social and moral standards and sanctions in society.

Buddhist Views on Death

The dominant Buddhist view is that life and death form a perpetuating cycle; life does not begin at birth, nor does it end at death, as there is rebirth. When a person dies, the physical body returns to nature while the mental energies manifest themselves in another form, either through rebirth or re-becoming. When someone passes away, he or she may suffer in three realms of evil: hell, hungry ghosts, and brute beasts. Therefore, death rituals serve to relieve the dead of these sufferings, as well as to guide the deceased through the journey to rebirth. In order to be reborn into a better place, one must avoid bad deeds and tread the right path in life.

Daoist Views on Death

The fate and salvation of the dead in the netherworld remains a central concern in Daoist funerary services. Death rituals serve to summon the dead soul, to deliver it from suffering in the underworld, and to transform it through the renewal of life. There is a belief that there is an "inheritance of sins" that continues and grows over generations. Evil deeds committed by ancestors are connected with the misery, suffering, and calamities experienced by the current generation. By performing death rituals, the living can help the dead accumulate merit and thus decrease the impact of the dead on the living.

Those who have no family (preferably male descendants) to perform the necessary rites are doomed to become "hungry ghosts," homeless and dangerous who seek victims to kill so they can reincarnate. Thankfully, these spirits are locked up in hell except for 2 weeks of every year beginning on the 14th day of the 7th month of the Chinese lunar calendar. To propitiate these evil ghosts at this time, Chinese operas and public offerings are organized. Rice will be distributed to the poor so that both the living and the dead will be rid of hunger. This Ghost Festival is a major event in traditional Chinese communities.

Understanding Chinese Death Taboos

The Chinese are one of the biggest migrant groups in many major cities in North America, Australasia, and Europe. Mental health professionals and bereavement counselors in those places need to be aware of Chinese attitudes toward death and the associated taboos. The low utilization rates of hospices, palliative care, and bereavement and mental health services may be partly due to the cultural alienation that Chinese people experience when their views are either not understood or not respected. Understanding of these taboos and the creative utilization of Chinese rituals in the design of social and health services are crucial to the Chinese, wherever they may live.

Christian Beliefs and Traditions

Christianity is a monotheistic religion that centers on the life and teachings of Jesus of Nazareth as

they are presented in the New Testament. The New Testament is the second major component of the Christian Bible. The Hebrew Bible, called *Tanakh* in Jewish theology and the Old Testament in Christian theology, comprises the first section of the Christian Bible. Although they may differ in the book order, most Christian denominations define the New Testament as 27 books, which include the four gospels, the book of Acts, the 21 epistles, and the book of Revelation. Some Christian groups, however, challenge this composition by including additional books or excluding one or more of the 27 core texts.

Christianity is the largest religion practiced in the world. Approximately 2.1 billion people identify as Christians. The United States of America, Brazil, and Mexico have the three largest national Christian populations. Christians make up roughly one third of the world's population.

There are five major branches of Christianity—Orthodox, Catholic, Protestant, Anglican, and Restorationism—and over 34,000 Christian denominations. The Roman Catholic Church is the largest church with more than 1 billion participants. Protestants, as a branch of Christianity, comprise the second largest group with approximately 500 million adherents. Although the term *Christian* encompasses diverse religious ideas and practices, this entry highlights the shared beliefs of the crucifixion of Jesus of Nazareth and the role of his death in redemption and salvation. The differences between Protestant, Orthodox, and Catholic interpretations of the consecration of bread and wine during Christian services also are addressed.

Jesus of Nazareth

Christian beliefs center on the life and death of Jesus of Nazareth. Most Christian groups revere Jesus as the son of God and the incarnation of God. For Christians, Jesus is divine. He is the Messiah, or one who is anointed, whose arrival was prophesized in the Tanakh or Old Testament. The word *Christ* is the English term for the Greek word Χριστός (*Khristós*). Kristos was used in the Greek Old Testament to translate the Hebrew-derived word *Messiah*. Christ, which is a title and not a name, describes the divine nature of Jesus of Nazareth. In common usage, Jesus the Christ is generally shortened to Jesus Christ. Followers of Jesus are known as Christians, since they believe that Jesus is the anointed one. According to Christian theology, Jesus died for humanity's sins. His birth, crucifixion, resurrection, and ascension into heaven were required to open the gates of heaven, or salvation, to human beings. Without this sacrifice, people would not be able to join God in eternal life.

The exact date of Jesus's birth is unknown, but scholars commonly estimate that Jesus was born between 6 and 4 B.C.E. The story of his birth is told in the writings of Matthew and Luke in the New Testament. The traditional Christian understanding of Jesus's birth emphasizes that he was conceived by the Holy Spirit and by Mary of Nazareth, who was a virgin at the time of conception. Many Christian groups (including the Roman Catholic Church and the Eastern Orthodox Church) assert that Mary was a virgin during Jesus's conception and for the rest of her life. Other Christian churches (e.g., many Protestant churches) teach that Mary was a virgin during conception, but not for her entire life.

Prior to the conception of Jesus, the angel Gabriel appeared to Mary while she was engaged to Joseph. Gabriel told Mary that she was to be the mother of the Messiah and the child would be conceived by the Holy Spirit. An angel of the Lord also told Joseph about Mary's pregnancy in a dream. The angel told Joseph not to be afraid, to continue with the marriage, and to name the child Jesus. Joseph and Mary married, and Jesus was born in Bethlehem, Judea.

The conception of Jesus is celebrated as the Feast of Annunciation on March 25. The birth of Jesus is commonly celebrated on December 25. Eastern Orthodox Christians, however, celebrate Jesus's birth on the evening of January 6 and the day of January 7, a period known as the feast of Theophany or the feast of Epiphany. Prior to 330 C.E., Roman Christians also used the January date to mark Jesus's arrival.

Beyond his birth, little is known about Jesus's life before he began his public ministry. Jesus started his work as a teacher and healer when he was around 30 years old, and spent approximately 3 years doing this work. According to the gospels, he drew large crowds (at times numbering in the thousands) as he traveled and spoke in Galilee and Perea.

Jesus's final meal with the apostles, the 12 people chosen to spread the word of Jesus's

teachings, before his execution is an important event in Christian traditions. During the meal, which is commonly known as the Last Supper or the Lord's Supper, Jesus explained that one of the apostles would betray him. He also shared bread and wine and told his disciples that these were his body and blood. The gospels of Matthew, Mark, and Luke and the First Epistle to the Corinthians discuss this dimension of the final meal. For example, the Gospel of Matthew (26:26–29) notes: "Now as they were eating, Jesus took bread, and blessed and broke it, and gave it to the disciples and said, 'Take, eat; this is my body.' And he took a cup, and when he had given thanks he gave it to them, saying, 'Drink of it, all of you; for this is my blood of the covenant, which is poured out for many for the forgiveness of sins. I tell you I shall not drink again of this fruit of the vine until that day when I drink it new with you in my Father's kingdom.'"

After the final meal, Jesus prayed in the Garden of Gethsemane. Temple guards arrested Jesus while he was in the garden. Judas Iscariot, one of the apostles, is said to have betrayed Jesus by identifying him to the guards. Jesus of Nazareth was eventually charged with treason and brought before the Roman procurator Pontius Pilate. Pilate offered the crowd a choice between Jesus of Nazareth and Barabbas, a political prisoner charged with insurrection. The crowd opted for the freedom of Barabbas and Jesus was sentenced to death. Jesus died in Calvary (also called Golgatha) after being crucified on a wooden cross.

Death and Resurrection

The books in the New Testament explain how Jesus was crucified, died, and buried within a tomb. Three days after his death, Jesus was raised from the dead. The gospels of Matthew, Mark, and Luke all tell of the resurrection of Jesus. Each text, however, emphasizes different points and varies in the details provided. In the Gospel of Matthew, for example, an angel appeared to Mary Magdalene and another Mary (believed to be Mary the mother of Jesus) when they went to anoint Jesus's body with spices and told them that Jesus would be resurrected. In contrast, the Gospel of Luke says there were two angels, whereas the Gospel of Mark suggests it was a youth dressed in white.

Mary Magdalene, a disciple of Jesus, was the first person to see Jesus after he returned. The Gospel of John details how Mary Magdalene returned to Jesus's tomb only to find his body missing. Weeping at the tomb's entrance, Mary Magdalene did not initially realize that the person near her was Jesus. After recognizing him, Mary Magdalene was told to spread the word of Jesus's resurrection to other disciples.

In the New Testament, Jesus appears multiple times to followers after his death. For example, on one of these occasions, popularly known as the "Doubting Thomas" occasion, Thomas the Apostle encounters Jesus. Thomas does not believe that the person he sees is Jesus and asks to touch the wounds in Jesus's hands and feet to verify his identity. For Thomas, seeing is not believing. Touch is needed to affirm Jesus's resurrection.

Ascension

Although multiple versions of the Ascension exist, accounts emphasize how Jesus bodily ascended into heaven 40 days after resurrection. After ascending to heaven, Jesus sits at the right hand of God, comprising part of the holy Trinity. The Trinity doctrine states there is one God, who is Father, Son, and Holy Spirit. The bodily ascension of Jesus represents the union of human beings and God. It highlights how Jesus embodies both the divine and the human. The Ascension is discussed in Mark 16:19, Luke 24:51, and in the first chapter of the Acts of the Apostles. The Apostle's Creed and the Nicene Creed also celebrate this event.

Historical Sites

The historical sites associated with the crucifixion, burial, and ascension of Jesus are located in Jerusalem. The Church of the Holy Sepulchre, also known as the Church of Resurrection, is believed to be the site where Jesus was crucified and buried. The hill of Calgary, the site of crucifixion, and the tomb where Jesus was buried are both believed to be located at this site. Roman Catholics, Greek Orthodox, Armenian Orthodox, Syrian Orthodox, Coptic Orthodox, and Ethiopian Orthodox all share in the control and management of The Church of the Holy Sepulchre, which is located within the walled Old City of Jerusalem.

The Chapel of Ascension (also called Mosque of the Ascension, Church of the Ascension) in the Village of al-Tur, Mount of Olives, Jerusalem, is believed to mark the site where Jesus ascended into heaven. A stone imprinted with Jesus's footprints is displayed in the chapel/mosque. The Islamic Waqf of Jerusalem owns the site, which is open to the public. The area has been a sacred spot for thousands of years. Early Christians initially honored the Ascension of Christ in a cave on the Mount of Olives. By the late 300s C.E., the site of the Ascension was established at the present location, uphill from the cave.

Holy Communion, the Eucharist, and Transubstantiation

Christians remember Jesus's actions at the final meal with disciples in weekly services through the act of Holy Communion, or the Eucharist. The word *Eucharist* can refer to the act itself and/or to the bread and wine used during the act. During Holy Communion, the priest or minister blesses bread and wine (or grape juice) through a series of prayers and actions. After the bread and wine are consecrated, churchgoers leave their seats and go to the front of the church to receive a piece of bread and a sip of wine (or grape juice). This ritual re-creates the moment during the final meal when Jesus gave disciples bread and wine, explaining that these were his body and blood. It reminds Christians of how Jesus "poured out his blood" during crucifixion so that people could be restored to grace.

Most Christians believe that communion brings a person in relation to the presence of Jesus in some way. Christians differ, however, in how they understand what occurs during this rite. Roman Catholics, Orthodox groups, and some Anglicans, for example, believe that the bread and wine are turned into the actual body and blood of Jesus. The Roman Catholics have developed a theory of transubstantiation to explain this transformation.Transubstantiation is the transformation of the bread and wine into the actual body and blood of Jesus by the Holy Spirit. Although they continue to look like bread and wine, the Holy Spirit changes the substance of these objects into the body and blood of Jesus. This ritual symbolizes the separation of Jesus's body from his blood on the hill of Calvary and their reunion during resurrection. Within Roman Catholicism, only ordained priests can consecrate the bread and wine for Holy Communion.

Commemorating the Crucifixion, Resurrection, and Ascension of Jesus

Beyond the weekly commemoration of Jesus's sacrifice for humanity in Holy Communion, specific holy days mark Jesus's death, resurrection, and ascension. These holy days are not fixed in relation to secular calendars, but are considered "movable feasts." That is, they are determined in relation to the moon cycle (not the cycle of the sun), and the actual dates of each change from year to year. Each holy day is marked by a church service as well as other activities.

Lent is the period of fasting and prayer that precedes the celebration of Jesus's resurrection. Lent generally lasts for 40 days, but there is a variety of ways churches calculate this liturgical season. Lent evokes the 40 days Jesus spent in the desert, where he fasted and was tempted by the devil. It is a somber time—one in which adherents turn inward for reflection and give up particular foods and festivities. In contemporary times, some Christians give up vices such as cigarette smoking or gambling during Lent.

Holy Thursday and Good Friday mark the final days of Lent. Christians recall the last meal Jesus shared with his disciples on Holy Thursday. Good Friday, the day following Holy Thursday, honors Jesus's crucifixion and burial. It is a solemn day and Christians are expected to be sober and quiet. The Christian season of Lent ends on Easter Vigil at sundown or at sunrise on Easter Sunday, depending on the denomination.

Easter is a joyous occasion—one that celebrates the resurrection of Jesus from the dead. For most Christians, Easter occurs between late March and late April each year. Easter is the first Sunday after the paschal full moon, which is the first moon whose 14th day is on or after the vernal equinox, March 21. Easter is one of the best-attended Christian holy days. Both Christmas and Easter draw large numbers of participants to services.

Many Christians incorporate pre-Christian beliefs and symbols into the celebration of Easter. For example, some Christians celebrate Easter by sharing decorated eggs. As part of Easter, eggs

represent the resurrection of Jesus and the promise of new life. Yet, eggs are also an ancient symbol of fertility. Within Judaism, the Passover Seder meal uses a hard-boiled egg to evoke sacrifice and the continuation of life. The Easter bunny is thought to refer to the hare, which also was an ancient symbol of fertility. The name Easter itself comes from Eostre, the pre-Christian Saxon goddess of fertility and birth. First-century pagans worshipped Eostre and thought she could bring fertility to families and crops. The celebration of Eostre was near the celebration of Jesus's resurrection; thus, missionaries adopted the name Easter to gain converts.

The Ascension of Jesus is celebrated on Ascension Day, which is held 40 days after Easter Sunday and usually falls on a Thursday. Some denominations, however, celebrate Ascension Day on other days. Although Ascension Day is important to Christians, it does not get the turnout associated with Easter.

In all, Christian beliefs and traditions are diverse and varied. Nevertheless, across denominations Christians share a belief in the importance of Jesus's crucifixion, resurrection, and ascension as the cornerstone of their faith. This significance is reflected in the designation and observation of holy days that commemorate these events. For Christians, Jesus's death and resurrection allow the salvation of humanity. Without his death and rebirth, human beings would not be reconciled with God and would be unable to enter heaven or eternal life after death.

Chronic Sorrow

Chronic sorrow refers to frequently misunderstood, unrecognized, pervasive, continuing, and resurgent grief responses that result from coping with loss due to significant permanent injury, illness, disability, or progressive deterioration of oneself (self-loss) or another living person (other-loss) to whom there is a deep attachment. As the source of the loss is ongoing, grief responses are usually life-long. The experiential core of this type of grieving is a painful disparity between perceptual reality and thoughts of what might have been, should have been, and still may be hoped for.

Chronic sorrow is frequently inaugurated by trauma, whether it is momentous (e.g., paralysis due to spinal cord injury; birth of a child with previously undetected, obvious anomalies), or consists of gradual, incremental concerns that culminate in a realization of the loss or its true severity (e.g., symptoms being confirmed as multiple sclerosis, worsening condition being diagnosed as schizophrenia). Recognition that life as it has been and was expected to be is forever lost and has been replaced by an initially unwanted, unknown, and often terrifying new reality can be considered a psychological emergency. The onset of chronic sorrow forces a reappraisal of one's assumptive world, that is, the very beliefs in life's predictability and fairness that have defined one's existence. Hence, the self and the world must be relearned, an arduous but potentially beneficial process that is often a focus of concern throughout the life span. In many instances there is a need for constant vigilance, around-the-clock care, expected and unexpected crisis management, and other severe and relentless reality demands.

Chronic sorrow per se is normal, and its manifestations are of interest to many professional human service disciplines, including thanatology, social work, nursing, psychology, psychiatry, family therapy, education, law, religion, rehabilitation,

and medicine. It is likely that the prevalence of chronic sorrow is increasing. Many persons with congenital disabilities once thought to signify limited and precarious lives are achieving normal longevity. As a result of technological improvements in health care, life spans of low birthweight infants and persons with many severely disabling conditions are lengthening. Survival rates for stroke victims and persons with major head trauma are increasing. Casualties of war, atrocities, and protracted, large-group conflicts add to this toll.

Conceptual Development

Introduced in the 1960s by Simon Olshansky, a rehabilitation counselor, administrator, and researcher, the concept of chronic sorrow was based on observations of parents of children with developmental impairments. Its applications and intent were clearly articulated, recasting what had been considered pathological as normal. Introduction of this concept heralded a paradigm shift by challenging prevailing professional perceptions, including stereotyping, negative labeling, and pathologizing of parents who were often seen as neurotic, autistogenic, schizophrenogenic, overprotective, and never satisfied. Although functioning devotedly with a paucity of resources to help their children, parents were caught in the currents of pervasive and episodic grief due to losses that were living, ongoing, largely disenfranchised, and that do not lend themselves to resolution or integration in the same way that many losses with finality do.

Following the introduction of the chronic sorrow concept, research activity was intense in validating the concept and assessing some of its aspects. Professional interest, as measured by the number of publications on chronic sorrow, declined somewhat in the 1980s. In the early 1990s, however, a renewed interest occurred, most notably in the field of nursing. The Nursing Consortium for Research on Chronic Sorrow (NCRCS) was established by the faculty of several nursing schools. Through their efforts, a number of important empirical research studies have been conducted with NCRCS support and oversight. An increasing interest in chronic sorrow by other professions as well has led to the recent development of specialized research tools, such as inventories, questionnaires, and scales.

Beginning in the 1990s, the concept of chronic sorrow has been undergoing an expansion from its original application to other ongoing loss situations. It is now considered applicable and useful to the understanding of the effects of a wide range of chronic diseases, disabilities, and progressive mental and physical deterioration such as spina bifida, amyotrophic lateral sclerosis (ALS), multiple sclerosis, Parkinson's disease, chronic mental illness, AIDS, Alzheimer's disease, and protracted coma, among others. The concept has been validated in many of these conditions, both for large numbers of those who are themselves the locus of the loss (self-loss), and for those who love them and care for them (other-loss). Because it pertains to ongoing and living losses, chronic sorrow may also apply to a limited number of other situations as well, such as many mothers who have relinquished their babies for adoption and are unable to determine what happened to them. Many such women report pervasive and resurgent grief responses, some more than 20 or 30 years following relinquishment. Chronic sorrow is also suggested as a useful construct in understanding and ameliorating the experiences of refugees and immigrants who have lost their culture, their country, the language of their birth, and intimacies of friends and family members left behind. The concept may also apply to some cases of infertility, as well as to loved ones of persons who have vanished; for example, those missing in action (MIAs), kidnap victims, and those who have inexplicably disappeared, their fates unknown.

Salient Characteristics of Chronic Sorrow

The existence of chronic sorrow is a function of how the loss is interpreted. Cultural context, group affiliations, and other spheres of influence affect the perception and meaning of loss. Individual factors influencing interpretations and responses include (a) identity development and self-appraisal, (b) lifestyle and circumstances, (c) history of losses, (d) spiritual beliefs and philosophy, (e) dreams and expectations, (f) quality of support, (g) degree of stigma, and (h) temporality within the life span. It may take many years for the full extent of the loss to be realized and accommodated. Moreover, interpretations may vary over the course of a lifetime for the same individual.

Understandably, there are qualitative experiential differences in how chronic sorrow is experienced by persons who are the locus of the loss as compared to those who are emotionally close to them (e.g., parents, siblings, partners, devoted friends). In some situations, self- and other-loss are reciprocal and interactive, for example, some caregiver–care receiver relationships.

Fantasy

The central role of the fantasy of what should or could have been and what continues to be hoped for is extremely complex and persistent, and its effects are both positive and negative. The fantasy can provide hope, forestall depression, and energize efforts to obtain the best possible resources, especially during the initial months and years after the onset. Activation of the fantasy can also intensify painful emotions due to the marked discrepancy between lost expectations and current living reality. With the passage of time, a gradual diminution of the fantasy and its potency, while attaching hope to more realistic possibilities, is usually beneficial, as chronic sorrow is fraught with unavoidable reminders of the loss, as well as external and internal triggers that can ignite sudden, temporary resurgences of grief intensity. Predictable stress points are well documented and are related to time periods during which developmental milestones and life cycle transitions would occur but cannot be obtained due to the severely limiting aspects of many chronic sorrow situations. Special events such as birthdays, Mother's Day, Christmas, and anniversaries can also trigger an increase in grief intensity.

Due to the lack of normative developmental and transitional markers, time may not have the same relevance as a means of ordering life events in the memory and retrieval systems of those affected by chronic sorrow. Because life narratives may not be formatted in the same way they are for unaffected cohorts, recall for personal history may be less distinct. Narratives may be sketchier, less sequential, more disorganized, and reflective of a life that is marker bereft. Moreover, when clear markers do exist, they may be negative.

Disenfranchisement

Chronic sorrow is frequently characterized by disenfranchisement. Often there is little or no social recognition that a loss has occurred, and there may be only scant social recognition of the person who is the source of the loss. There are no socially sanctioned ways in which to grieve the loss and no customary rituals or other systemic resources that provide support for grieving. At the time of realization of the loss, those most directly affected may be destabilized. It is normal for chaotic circumstances to last for a year or even longer. Despite these crisis conditions, the majority of affected persons are able to meet their challenges and function capably. Over the life span, however, shifting reality demands, chronic and episodic stress, and other effects of chronic sorrow usually preclude permanent adaptations. Despite its ongoing nature, chronic sorrow is *not* a state of permanent despair. The development of tenacity, resolve, a deeper sense of meaning and purpose for one's life, and other transformative processes can and usually do occur.

Complications and Family Impact

While chronic sorrow per se is nonpathological, it can increase susceptibility to complications over the life span. These include (a) clinical depression, (b) problems with identity development and poor self-esteem, (c) guilt, (d) anger, (e) stress (chronic and episodic) and stress-related ailments, (f) anxiety and clinical or subclinical trauma symptoms, (g) a deep sense of loneliness and alienation, (h) disordered intimacy and attachment (e.g., enmeshment, prohibitive fears of closeness or of having wants and desires), (i) existential angst (e.g., disillusionment and spiritual conflicts), (j) addictions relapse, and (k) periodic affective flooding or loss spirals that may be so overwhelming as to be temporarily disabling.

Even in contemporary diversified family structures, family identity and social ostracism are powerful forces in the lives of family members. Family stress is amplified when developmental transitions are not completed by a member who cannot achieve independence. Loss of privacy occurs due to the involvement of health service providers. Many services are provided in the home, and the effects of this necessary intrusion into family life hold consequences for all family members. Effects of chronic sorrow conditions on children in the household vary widely. Some feel resentful of being deprived of their parents' attention. Some

are affected by survivor guilt. Some children become precociously intuitive, compassionate, and wise. Effects on the marital relationship also vary. Some relationships are splintered, while others are strengthened. The problem of depleted caregivers is often unavoidable. Most families regain resilience and organization, and many families report improved cohesion, hardiness, and increased compassion, gentleness, and understanding among family members. Family functioning is generally enhanced by structure, predictability, role flexibility, and by acknowledging and balancing the needs of all family members in some equitable way.

Chronic sorrow can give life its purpose and meaning. It may also be characterized as a series of losses that accrue throughout the life span. As it can and often does become the lens through which all else is viewed, it may play an invisible role in end-of-life decision making. Recognition and understanding of chronic sorrow by all health service providers can only be of benefit.

Clergy

Clergy is a commonly used term to describe spiritual leaders within a faith community who serve a local assembly of adherents such as a congregation, synagogue, or mosque, or provide spiritual care in a specialized setting such as a hospice, university campus, or military unit. As leaders in their faith communities, clergy have a historic and enduring presence during times of dying, death, and bereavement. Although the role of clergy varies between and within religious organizations, there is continuity in the important role that the clergy provide in assisting the dying, interpreting religious laws governing death, performing burial rites, and consoling the grieving.

The Greek word from which *clergy* is derived has roots in the Judeo-Christian theological idea that it is the *lot* or the *inheritance* of the clergy to serve God in ritual worship on behalf of the community. Most theistic traditions understand the clergy to have a divine calling that destined them for this work and ordain individuals in some ritualized ceremony for this function of leadership within the faith community and representation of it to the outside. Other terms for clergy are faith-group specific, such as *priest* (Anglican, Buddhist, Orthodox, Roman); *minister*, *pastor*, or *elder* (Protestant); *rabbi* (Jewish); imam or *mullah* (Islam); *medicine man* (Native American); and the like. Faith traditions also dictate whether the clergy role is open to both men and women or is restricted to one gender, as in the Roman Catholic practice of restricting ordination to males.

Professional Preparation

Most clergy undergo a rigorous course of undergraduate and graduate studies in preparation for clergy leadership roles. The Association for Theological Schools is recognized by the U.S. Secretary of Education and the Council for Higher Education Accreditation to set academic standards for the more than 250 accredited graduate

schools that offer postbaccalaureate theological programs. The standard Master of Divinity (M. Div.) degree required by most faith groups for clergy ordination involves a minimum of 3 years of full-time academic work to meet the educational and personal spiritual formation criteria. Many seminaries include clinical pastoral education as a degree requirement; this education involves students working directly with people in spiritual need, such as hospitalized patients, while being observed in their ability to understand and relate effectively. This direct supervision assists in the development of spiritual assessment and interpersonal skills that are crucial in clergy pastoral work, such as ministry to the dying or bereaved.

Respected Leaders

Despite recent exposure of clergy sexual abuse, clergy are still recognized as esteemed leaders in their communities. A 2007 career survey in *U.S. News & World Report* included clergy as a respected profession, noting that religion provides an anchor in the lives of millions of Americans for which the clergy are regarded as indispensable religious leaders.

The U.S. Department of Labor, Bureau of Labor Statistics for the year 2006 reports there are over 404,000 active clergy in the United States. However, the actual number of clergy is likely much higher since the Department of Labor reports only salaried professionals, whereas clergy may serve in a on stipendiary arrangement, providing clergy services without remuneration or in exchange for other benefits such as clerical housing. Moreover, many nontraditional and new age religious communities may also fall outside of government reporting systems. The 1996 edition of the *Encyclopedia of American Religions* contains over 2,600 entries on religious bodies, suggesting the continued prevalence in U.S. society of numerous religious institutions along with their clergy leadership.

From Cradle to Grave

As faith community leaders, clergy regularly conduct worship services, preach, administrate, teach, counsel, and provide spiritual support. At times of significant life cycle passages, such as birth, coming of age, or marriage, clergy offer religious instruction and ceremony to mark these symbolic passages. Thus clergy offer premarital counseling sessions to prepare couples for marriage and conduct wedding ceremonies, they incorporate newborns into the faith community through sacramental rites (such as baptism into the Christian faith), and they preside at coming-of-age rituals such as a bar or bat mitzvah in the Jewish tradition.

But it is particularly during times of dying, death, and bereavement that clergy play a most significant role. Often viewed as an icon of hope in the midst of loss, the clergy serve as a familiar and supportive figure to individuals, families, and the wider community as they attempt to cope with the finality of death. It has been said that at the kingdom of the bedside, the pastoral shepherd is a nobleman. Because many religions espouse an afterlife, clergy are also sought for their wisdom, consolation, and insight into the sacredness of dying and the profound transition it marks between this life and what is understood to follow.

Pastoral Care Role and Functions

The role of clergy in all faith groups is to embody the resources, wisdom, and authority of the tradition's teachings and to apply them to the different life circumstances of the members. This practical application, or pastoral care, includes the personal attention the clergy offer to those needing emotional and spiritual support. A historical survey published in 1964 delineated four classic functions of pastoral care provided over the centuries as traced in key writings of pastoral leaders. These involve pastoral activities of healing, sustaining, guiding, and reconciling. These functions have broad application even beyond the Christian tradition because they pertain to common ways clergy of all faith traditions interact with persons in need. When applied to the clergy role in circumstances of dying, death, and bereavement, these four activities provide an understanding of the important pastoral care contribution clergy make.

Healing Role

Healing involves a restoration to wholeness, understood within a religious context as an inner spiritual state rather than solely the absence of disease or the search for a cure. While prayer for

cure is not unknown, clergy also pray for and with the terminally ill, anoint them in ceremonial acts to strengthen their inner sense of wholeness, and join families in prayers of commendation for the dying when death approaches. When cure is not a plausible goal, there is much spiritual strength to be gained with an enhanced sense of wholeness that is linked to communion with the divine as well as to family and personal relationships that are restored to wholeness.

Thus in many of the Christian traditions, anointing of the sick by the clergy with blessed oil is intended to convey both physical and spiritual healing during times of serious or life-threatening illness. Clergy perform this healing sacramental ritual at the bedside with the patient alone or including family and significant others. Over time, this ritual became so associated with the event of death that it was referred to as "last rites" and misperceived as essential to assure the safe transition to the afterlife. However, clergy increasingly use the anointing prayers at earlier stages of serious illness to express the support of the faith community for spiritual well-being in the midst of illness, as well as prayer for physical healing. When death is inevitable, however, anointing also serves to assure all of a broader sense of healing through the wholeness of spiritual peace.

Sustaining Care

Sustaining acts of pastoral care seek to support troubled persons in the vicissitudes of life. Pastoral sustaining includes encouragement to persevere in the face of death's power to otherwise cause fear and hopelessness, to gain strength by drawing from religious resources such as spiritual readings or devotions, and to experience comfort by the awareness of a faith community that prays for and with those coping with loss and grief. The pastoral act of sustaining also helps to restore a sense of the future and the importance of ongoing life.

For example, an imam sustains grieving survivors after a death by leading them in the proper Muslim practices for burial of the body. This involves arrangements to meet the religious requirement for burial, within 24 hours of the death, in a dedicated Muslim cemetery. At graveside, the imam may lead the ceremony, which includes the proclamation of the *Allahu Akbar* ("God is great") four times, reading Al-Fatihah, Sura 1, recitation of praises to the Prophet, prayers for the deceased, and prayers for the mourners. These ritual observances officiated by the imam uphold the grieving family by assuring them that they have fulfilled their religious obligations to the deceased with proper burial. The imam may also involve other members of the mosque to surround the grievers with understanding, creating a wider sense of validation of the significance of the loss. This support helps to sustain grievers as they move toward the future without the loved one who died.

Guiding Function

The guiding function of clergy care is focused on drawing upon a faith tradition's wisdom as it illuminates problem solving and decision making that align with the tradition's values and teachings. Clergy guidance can range from a casuistry system, in which a body of religious principles and rules are applied, to a specific situation to determine a decision to a supportive system in which a pastoral relationship of listening, understanding, and reflecting is offered from which emerges thoughtful but personal decision making.

For instance, in Jewish care of the dying, the rabbi may offer specific religious guidance about how the dying process is to be approached. A rabbi will look to the *mitzvot,* understood to be the divinely given commandments, to guide decisions about the preservation of life even as death approaches. There is some variance within Jewish religious traditions, but typically the rabbi will uphold the sanctity of God-given life by opposing any hastening of death such as in acts of euthanasia. Instead, the rabbi may guide the patient and family to a hospice that can provide end-of-life care designed to relieve the suffering of the dying and provide emotional and spiritual support to the entire family.

At others times the guiding function is expressed in the clergy's readiness to teach and discuss the understanding of the ultimate meaning and purpose of life in light of death. The approach of death can both deepen and stress the explanations that a religious tradition offers to its adherents. Clergy guide the dying or the bereaved to more completely understand their religious faiths' teachings regarding the human experience of death. Thus, Buddhist clergy will offer the Buddha's teaching

about the impermanence of life, the importance of calm and enlightened consciousness at the moment of death, and the insight that ultimately death is a friend since it leads to new realms of existence through accumulated karma. Through this guiding function, clergy of all traditions enable those under their care to transcend the pain of loss and experience solace in continuity with all those who, over time, have similarly experienced loss in death.

Reconciling Activities

The reconciling function pertains to those clergy activities that assist alienated persons to reestablish broken bonds with the divine as well as to mend estranged relationships within the family or circle of loved ones. Human reconciliation to the divine, in many religious traditions, requires an accounting of past behavior in the form of confession. Confession can be made privately to the clergy or corporately in the assembly of the faith community. An intention to rectify wrongdoing may also be required, such as the expression of regret and an intention to change before forgiveness and reconciliation are fully embraced.

Clergy efforts to foster reconciliation can be especially poignant in the context of dying since future time is obviously limited. Yet, the fact of restricted time can be an impetus for a dying person to focus on the accomplishments and regrets of a life. Some have suggested that the period of dying is a particularly fruitful time for relationship completion, especially if there is "unfinished business" among loved ones. Clergy are in a unique position to facilitate discussion on topics such as forgiveness, gratefulness, and love to foster a more complete and peaceful good-bye. Research suggests that such emotional and spiritual closure will also contribute to better outcomes in the bereavement period that follows a death.

For a time during the 20th century, advances in Western medical technology seemed to have displaced clergy from their traditional roles in spiritual support of the dying and the bereaved. Dying had become a medical challenge to be conquered, rather than an expectable though painful experience within the cycle of life. However, the death awareness movement of the last half of that century seems now to have restored a more holistic understanding of all aspects of dying, death, and bereavement, including the importance of spiritual understanding and the role of clergy as teachers, guides, and comforters to the dying and bereaved.

Cloning

The concept *cloning* refers to artificial embryo twinning, somatic cell nuclear transfer, and removing stem cells from embryos and adult individuals to be used to "grow" tissues, organs, or individuals. Embryonic cloning involves using an electric current or other technique to split a preembryo into two, each of which has the potential, under optimal circumstances, of gestation and parturition to develop into a member of the species. The more powerful technique of somatic cell nuclear transfer involves the removal of the nucleus of an unfertilized ovum and replacing it with the nucleus of a somatic cell, such as a skin cell, and then using a small electric current to cause these combined elements to reverse the specialization and revert to stem cell status. The resultant cell is somewhat like a fertilized ovum, except that the bulk of its DNA is that of the donor organism with the exception of the mitochondrial DNA that comes from the ovum. Finally, one goal of human therapeutic cloning is to produce cells that are

progenitors of those for specific organs, not entire organisms. Such cloning is commonly referred to as therapeutic cloning: the cloning of organs and tissues that are histocompatible with a potential recipient of a transplantation of the resultant cells or organ. To date, cloning as a technique is in its infancy. Medical science has little interest in cloning individuals or in artificial twinning. The major thrust is toward human therapeutic cloning.

Cloning and Death

The prospect of death, whether of oneself or a loved one, frightens most humans. The fear may involve various dreadful prospects supposed to await the dying person, from hell's fires, to the pain of separation, to the experience of nothingness. Even those not burdened by belief in an afterlife of judgment seek to remain alive as long as life holds a positive balance of meaningful activity.

Humans have long sought to extend life and forestall death by imprecations, pharmacological supplementation of essential physiological chemicals, surgical removal of tumors, and repair of injuries. In pursuit of longevity humans will cut calories to close to a starvation regimen, ingest unproven and disproven drugs (like laetrile), employ useless procedures (like coffee enemas), and take combinations of substances (like mega-vitamin therapy) believed through a combination of anecdote, assurances, and gullibility to beat back cancers and other life-threatening conditions. More recently, replacement of organs with transplants from donors, living and dead, human and animal, have become the more scientific tools of life extension. Modern medicine and its alternative imitators have become the first and last hope of the sick and dying.

The relatively recent emergence of human reproductive cloning techniques has added several other stratagems to the tempting arsenal of weapons against imminent death. This entry discusses the present technology of human reproductive cloning and the possibilities of human therapeutic cloning for replacement of lost or injured parts and for replication of highly valued individuals.

Cloning and Immortality

Some individuals view cloning as a kind of immortality. But such views are not consistent with the facts. A clone is a much younger twin of the cloned individual. Just as, when a twin dies, it is not claimed that he or she somehow lives on in the survivor, so it wouldn't be said of a clone that he or she is "the spittin' image," or exact duplicate or replica, of the source of the cloned DNA. The reason is that a clone would be raised by different parents in a different time with different influences on its development. Identity has as much to do with the specifics of time and place as it does with genetic endowment.

Clones as Organ Farms

However, there are other attractions to having a clone twin. A clone would be a potential source of transplantable organs for an individual who suffers from severe vital organ failure. And the transplantable heart or liver or kidney would not require suppression of the immune system, as it likely would be recognized as "same" by the individual's defenses against foreign protein. Transplanted organs from cadavers or neomorts are typically histologically incompatible with the recipients, necessitating a life-long regimen of drugs to suppress the immune system.

The problem with this "solution" to the need for transplantable organs is that, to date, the ability to clone humans as "organ farms" is highly constrained by both ethical and practical considerations. Ethically, of course, creating another human individual to serve as a potential source of organs is a monstrous idea that violates the most fundamental canons of morality. Such clones, created specifically to provide older twin siblings with a pool of compatible organs, would return the world to a kind of exploitative slavery the equivalent of enslavement practices of the past. Their lives would be forfeited at any time a vital organ was needed by the older twin, and their lives would be otherwise inconvenienced by the need for nonvital organ, tissue, and blood transplants and transfusions. Even if the usual protections of informed consent were scrupulously applied, the clone would be under constant pressure to view him- or herself as in thrall to another, more favored person.

But ethical scruples are not the only reasons not to move toward human cloning for transplantation's sake. As was learned from the unfortunate cloned sheep, Dolly, whose life span was half that

of an ordinary sheep, cloning from adult cells (e.g., skin cells), in the rare case where the effort works, produces an individual already physiologically much older than an infant normally conceived. The apparent reason is that cells from a mature individual have begun to accumulate genetic errors caused by exposure to radiation and other environmental elements, and such breakage serves as a precursor to all manner of disorders, including cancers. To put the point colloquially, the clone created from the DNA of a mature human's somatic cells is born already aged with a biological age roughly equivalent to that of the source of the DNA.

It might be possible to clone an infant and then freeze the embryonic clone to be thawed and gestated upon the need for organ replacement arising in the older "twin." Such a procedure, however, is in conflict with the ethical principle of respect for individuals that serves as a barrier to any such stratagem.

One other theoretical possibility would be to manipulate an embryonic clone, if we had the understanding of development sufficient to do it, to produce only a specific organ for transplantation. In such an approach, the normal embryonic development that is directed by the embryo's DNA in utero would be managed so as to produce only the desired organ. Just how this could be accomplished in utero is unclear and unknown, but it might be possible to "grow" vital organs and other tissues in vitro until mature enough for transplantation. If the clone had been "begun" while the "older twin" was still in infancy, then cryopreserved until it was evident that a vital organ would be needed and subjected to a still-nonexistent methodology of developmental management, such a fantastic possibility might be realizable. But we are far from such therapeutic cloning. More likely is therapeutic cloning of important tissues in vivo, where the normal processes of cell regeneration are managed so as to replace damaged or diseased cells and organs.

Cloning as a Way of Regaining the Individual

Cloning has already been used as a way of "recovering" beloved pets. For individuals with extraordinary disposable income, the cloning of a pet from the cells of a deceased animal offers the illusion of a numerically identical replacement. Apart from such expensive sentimentality, cloning of valuable animal stock, such as a prize bull or racehorse, may be attractive to those who view such animals as utilitarian investments.

Those who have lost children may find the possibility of cloning "replacements" to be powerfully attractive. A parent who has lavished love and nurture on the developing child, only to see him or her struck down by an accident or assailant, might well find the possibility of "starting over" on "that child" to be deeply compelling. One individual who struggled with this possibility is Thomas Murray, President of the Hastings Center for Society, Ethics, and the Life Sciences, whose daughter was murdered in college. In a moving essay Murray reviews the temptation to seek a replacement through cloning his daughter and rejects it as providing a false hope, the illusion of a replica where, because of the unique nature of the lost person and her relationship with others, no replica is possible. He concludes of his lost daughter that it would be preferable to keep the memory of his daughter alive than attempt to produce a genetic facsimile.

Another philosopher, James Lindemann Nelson, has observed that the life of a clone would be inescapably linked to the set of expectations and potentials of the one who has been cloned, so that his or her life would lack the joyous spontaneity that comes with forging one's own identity. While serving as a replacement for one tragically lost might console those grieving that loss, the expectations placed on such a clone would constitute a burden that is both unfair and tinged with pretense.

A straightforward utilitarian reason for cloning individuals would be to recover the talents that particularly gifted persons may have. Many assume Albert Einstein was unique in his genius. Luciano Pavarotti thrilled millions with his stunning arias. Salvador Dali astounds with his inventive genius expressed in depictions of the familiar rendered unfamiliar. Some think these geniuses should be recaptured for posterity.

Apart from the psychological problems, replacement cloning is likely destined to disappoint. Not only are there problems associating with aging DNA, but the influences and conditions that surrounded the cloned individual will differ from those that obtain for the clone. In addition to this immutable fact, present and envisioned technology cannot overcome the dismal morbidity rate of

cloned offspring that plague virtually all cloning efforts for animals.

The benefits of cloning we are likely to see in our lifetime are modest but important. We will come to integrate into medicine's practice the cloning and transplantation of specific tissues and structures as replacements for diseased or damaged ones, enabling lives of normalcy to be realized for those who today struggle with chronic diseases such as diabetes. But regeneration of entire individuals is both improbable and quite possibly a nightmare masquerading as a dream. Cloning, like other life-extending measures, may enable the living to enjoy better lives: For those who have lost loved ones tragically, they will continue to live with their sorrow.

Clothing and Fashion, Death-Related

Recommended burial clothing for men and women represent an optional purchase for families when making arrangements for the deceased through funeral homes. Other than the *tahrihim* (white linen shrouds symbolic of equality that are traditional among Jews), the *tallit* (prayer shawls), and popular angel wraps and gown sets prepared for infants, contemporary burial garments do not differ from day-to-day clothing; indeed, any type clothing provided by the family is deemed to be acceptable. However, some traditions continue. This entry is based on one such custom of preparing clothes for one's burial that continues among older women of Croatia and Bosnia and Herzegovina, who have prepared their clothes for death and then set these items aside either at home or in the possession of relatives for their future burial. Although the custom has a long legacy in this eastern region of Europe, it is becoming less known among the younger population and, as a tradition and as a fashion, is dying out.

This entry emerges from a visual art project of women in Croatia and Bosnia and Herzegovina who prepare clothes in which they want to be buried. The relationship of those women to death is explored, and the role clothing plays in the social, cultural, and gendered constructions of identity is useful for understanding the women's lives, which have been shaped by turbulent historical, political, and cultural events. Even though men do prepare their clothes for death, it is the case that women have predominantly prepared the clothing for death for themselves and their husbands.

Religion

The influence on the custom of preparing clothes for death developed from different orientations, some of which emerge from the great monotheistic religions that had a strong influence on folk beliefs and customs pertaining to death. These beliefs and customs include different elements of old Slavic cultural heritage, pagan traditions of paleo-Balcan, Asiatic, Greek, and Roman cultures.

The Croatian death and funerary customs are replete with beliefs about another life after death. Such beliefs have theistic roots and are, in large part, inspired by the Bible. These are beliefs in hell, heaven, saints and angels, God, and God's justice and punishments. Connected to these beliefs are ethical questions of good and evil and the belief

that good will be rewarded after one's death, whereas evil will be punished.

The tradition of preparing clothes for death continues to be practiced predominantly in the region's Orthodox Christian and Roman Catholic communities.

However, the custom appears to be less practiced among Muslims because, according to Islamic burial custom, a dead person's body is wrapped in white sheets in the belief that everyone is equal in death. Before the Bosnian war (1992–1995) Muslim women may have prepared their death attire, but now preparation is conducted primarily in the mosques where the death bathing ceremony also takes place.

Clothes for Death: Cultural and Fashion Influences

In a catalogue for the exhibition on funerary customs that was held at the Ethnographic Museum in Zagreb, Croatia, in 1985, it is noted that the preparation of clothes for death represents a rural custom of older people creating the clothes in which they want to be buried. They might also prepare a cover for a coffin and a piece of cloth for tying under the chin and for the hands and legs. Many individuals prepare the best suit or outfit they own or a folk outfit or clothes they wore at their wedding.

Most women fashion their death garments to include a skirt, blouse or a shirt, jacket (as part of the suit), knickers, petticoats, socks, and scarves. In most cases the clothing is brand new, never before worn. Such clothing is special but not too festive.

Some women have more traditional handmade garments, while some outfits are more modern, but for the most part, the outfits are made up of a mix of traditional and modern.

Rosa (see Rosa image) had a waistcoat woven by specially trained tailors for the folk outfits. In the past many people were buried in traditional folk outfits, or wedding dresses; this means that many of the traditional handicrafts are no longer available for display in cultural settings.

Apart from clothing some women had prepared other objects or garments to make their death attire complete. In Croatia women prepare special shawls referred to simply as "towels." Most of these were made from silk or cotton. They were predominantly plain in color, mostly white with few embroidered patterns, although some women

Rosa (Banjica, Bosnia and Herzegovina), 2007

Source: Margareta Kern.

had elaborate embroideries of flowers (see Liza image). The towels are used as decoration during the funeral procession and are usually placed on a cross, carried by the person walking at the front of the procession. After the funeral, some of the towels will be returned to the family to be retained and then used again for many generations, while some towels will be donated to the church. Other, more ordinary cotton towels are used for bathing the person's body after he or she dies.

In Bosnia and Herzegovina some women weave colorful woolen kilims to be placed in the coffin upon which the body is laid. Red thread referred to as "rujak" is commonly used in the death attire in Bosnia and Herzegovina. The threads have more of a symbolic use—once the deceased person's body is laid in the coffin, then a cross is "drawn" with the red thread. In some cases the red thread can be drawn across the hands and across the feet. (See Cvijeta image.)

In Bosnia and Herzegovina women prepare knitted woolen slippers called *priglavci*. Although worn daily, new slippers adorn the body upon death. Shoes are not usually prepared as they are not put on the dead person, though this custom may vary in different regions.

Podbradak are small sheets of gauze, which are tied around the head in order to keep the mouth from being open. Sometimes they are used for tying legs too. Some women had prepared this as well. *Pokrov*, meaning "cover," is a plain white sheet made of cotton without any discreet patterns. The sheet is intended to cover the deceased, once the body is laid in the coffin.

The influence of Western European countries, especially Germany, Austria, and Switzerland, because of the large numbers of people from the former Yugoslavia who work in these countries as guest workers, can be seen in the presence of pillows. These pillows usually have a rough velvet cover and folksy motives that mimic those found in Bosnia. Pillows are also symbolic in that they connect to sleep and rest, and they also connect to beliefs in the afterlife. For example, in the past people believed that a pillow should be stuffed with hay rather than feathers to prevent the deceased from flying and then returning to disturb people.

Fashion also influences what women want to wear in death. A number of women exchanged a traditional item of clothing they already prepared (long cotton underwear trousers) for the new, more fashionable item, in this case a nylon petticoat.

Most of the women who prepared clothes for death lived in rural areas; those who resided in towns, however, were brought up in a rural area. Women who were displaced during the civil war in Bosnia and Herzegovina (1992–1995) had packed their clothes for death as the few important garments to take with them.

It is difficult to conclude an average age when most women prepare their clothes for death. They prepared some garments since their youth, adding other items later. Some women prepare their clothes for death when someone in the family dies. All the women inform their daughter or daughter-in-law about their death attire. In most cases family members know where the clothes are kept.

Little has apparently been written about the death clothing custom as it is currently practiced. What is available are contemporary texts that refer to the customs at the beginning of the 20th century and the late 19th century, showing that nevertheless the cultural, religious, and social significance of this custom continues to be of interest. One ethnographer of the early 20th-century period indicates that death had a meaning beyond losing an individual: It represented a

loss for the whole community. The symbolic importance of the continuation of community is shown from the 19th to the 20th centuries through the textiles, clothes, and jewelry of the period.

In the early 20th century it was expected of the young women of the village to prepare clothes for death for themselves, the husbands, and for the young children. Such outfits are similar to that worn on religious holidays such as Easter, Christmas, and to church on Sunday morning. The funerary customs clearly prescribed the type of clothes the person was to be dressed in during the festivities and also in death. These rules depended on age, marital status, and wealth. Young women were buried with a crown similar to that used in a wedding, even if not married. Young married women were buried with the clothing and the textiles they brought with them into the marriage.

Clothes for death have developed under varied influences, ranging from the great monotheistic religions to the old Slavic cultural heritage and pagan traditions. The rituals that surround and make up the funerary customs also have seeped into the religious and cultural beliefs: the concepts of hell, purgatory, heaven, God, saints and angels, the concepts of soul and death, afterlife, and the other world.

What people set aside for their burial has changed according to the fashion and social and cultural norms of the time. What has not changed is that people, predominantly women, prepare attire for their burial. They do not want to bring shame on their families by not being ready and presentable after their final hour. They are also preparing for a journey, with the clothing as a vehicle for traveling to the other world.

Finally, and despite the cultural influence among the elderly, this custom is disappearing from the cultural and social landscape of Croatia and Bosnia and Herzegovina, and probably other countries of the Balkan region as well. Documentation of this dying cultural artifact provides important insights as well as a new way of looking at clothing. Something that binds us so much to the earth and the world of appearances and presentation can also serve as a safe space to contemplate and imagine the unimaginable: time when disappearance rather then appearance will be of importance.

Columbarium

Columbarium (plural columbaria, columbariums) refers to a structure designed to hold the cremated remains of multiple individuals. The term derives from the Latin *columba*, meaning "dove" or "pigeon," because the remains are placed within individual recesses that resemble those of dovecots. Columbaria were first built in Italy during the late 1st century B.C.E. and usually housed the cremated remains of nonélite members of Roman society. They were sometimes associated with the household of patrician Roman families or funerary clubs (associations that guaranteed burial for

their members). Roman columbaria were a purely urban phenomenon and, although examples have been excavated throughout Italy, nowhere have they been found on the same scale or in the same numbers as the environs of Rome. When cremation was superseded by inhumation during the 2nd century C.E., columbaria fell out of use in Europe, reemerging as a feature of the cemetery environment only in the late 19th century as Europe and the United States once again embraced cremation.

Ancient Columbaria

Roman columbaria varied in size and, although some accommodated several hundred urns, most were relatively small, housing between 50 and 100. They are often described as subterranean chambers when, in fact, many had levels constructed above ground. In essence they comprised one or more rooms, their walls lined with small semicircular or rectangular niches (*loculi*). These niches were designed to house cinerary urns, either individually or in small groups. Below the *loculus,* space was reserved for a small inscribed plaque (*titulus*), which recorded the name and personal details of the individual(s) whose ashes were interred there. The space could also be painted with the same details rather than incurring the expense of an inscribed epitaph. This practice reflects the strong desire for commemoration that was held by all members of the Roman community, regardless of social status.

In some instances, the individual loculi were sealed with decorated plaster, marble, or tile, and sometimes the surrounding area was embellished with brightly colored frescoes and stucco to distinguish the niche and its occupants from the many others within the columbarium. Small mythological scenes and themes from nature, including flowers, fruit, and birds, were commonly selected for this purpose. The owners of each loculus were responsible for its decoration and this, along with the recording of names, occupations, and relationships in the epitaphs, sheds light on the lives, beliefs, and concerns of the people who used columbaria.

The best-preserved ancient examples of columbaria include those of the so-called Vigna Codini on the Via Appia, and the Columbarium of Pomponius Hylas, on the Via Latina, which were built during the early 1st century C.E. The three Vigna Codini columbaria contained the remains of many slaves and freedmen (former slaves) of the Julio-Claudian dynasty, including ex-slaves of Livia, wife of Augustus. Some wealthy patrons constructed columbaria specifically for their slaves and freedmen, such as that built by Statilius Taurus on the Via Praenestina, which accommodated over 700 burials. The inscribed dedications and epitaphs associated with individual burials within these structures occasionally record heirs and other family members, consequently revealing much about household, personal, and conjugal relationships among many of the important families of the Augustan period. The fact that many slaves and freedmen of the same household were interred together reflects the perceived importance of continued membership of the specific identity group to which they had belonged in life. In other instances, columbaria were built by a cooperative body or burial club (*collegium*), with loculi allotted or sold either individually or in groups. The individuals interred within these columbaria may have shared no connection in life.

Ancient columbaria were one response to the problem of high levels of urban mortality. They facilitated mass disposal of cremated remains, while continuing to observe religious and social demands for remembrance. However, during the late 1st and early 2nd centuries C.E. the design of columbaria evolved, becoming smaller and more focused on the family group (still including slaves and freedmen). Large structures capable of accommodating hundreds of urns were replaced by enclosures and aboveground chambers, such as those of the Via Laurentina at Ostia, or "house-tombs," found at Isola Sacra and the Vatican necropolis. Usually built by freedmen, these tombs closely resembled houses, with doorways placed beneath a cornice and triangular pediment, but their interior walls remained lined with loculi in the manner of earlier columbaria. As inhumation began to replace cremation as the predominant rite of disposal across the Roman world, these

tomb structures were adapted to accommodate burials and no new columbaria were built.

Modern Columbaria

In some parts of Asia the storing of ashes in columbaria has long been associated with Buddhist temples; however, in other cultural contexts, the construction of modern forms of columbaria is a relatively recent phenomenon. In the late 19th century the true columbarium, as a place for the collective storage of individual cremation burials, began to appear as a feature of the urban environment of Europe and the United States, partly in response to the return of cremation as a recognized form of body disposal. A columbarium was built in the famous Père Lachaise cemetery in Paris in 1889, and the architecturally celebrated San Francisco Columbarium opened in 1898. The first purpose-built example in the United Kingdom (the West Columbarium, 1901) was designed by Ernest George as part of the Golders Green Crematorium in London.

Today columbaria are commonly constructed in association with churches or the chapel buildings of a crematorium. These structures retain the use of recess-lined walls for the interment of ashes, with space available for the deceased to be commemorated. In many modern columbaria the niches are filled with memorabilia associated with the deceased and sealed by glass; this is a practice seen at the Bohemian National Cemetery in the United States (1919), and more recently at the Benešov Cemetery in the Czech Republic. Photographs are now commonly used to identify the deceased.

Like their ancient equivalents, modern columbaria across the world reflect the pressures imposed by increased urbanization and its associated demands for affordable and accessible burial space. The Choa Chu Kang Columbarium in Singapore illustrates the enormity of many modern columbaria; it contains 147,000 niches distributed over 18 four-story blocks. In China and Hong Kong, elaborate new columbaria have arisen as a consequence of official government encouragement of cremation since the 1960s. However, in Europe, the increasingly popular practice of scattering ashes has led to a decline in the construction of purpose-built columbaria.

Commodification of Death

In modern societies death has become a commodity; people pay for goods and services in order to pay their last respects to the dead. This commodification of death occurred in the past 2 centuries with the emergence of the professional undertaker. Before that, neighbors, relatives, and charities took care of the handling of dead bodies. Since ancient times, however, people might have offered something valuable in exchange for death-related, ritual services and goods. The Tiwi Aborigines from north Australia are a case in point, showing that the commodification of death is not necessarily a modern phenomenon and limited to industrialized societies. In olden times these hunter-gatherers had elaborate mortuary rites in which ritual workers were paid with paraphernalia, spears, and other artifacts. Later on, in the 20th century, Australian dollars were introduced, along with printed fabrics in traditional designs, to this end. The cloths first used to be hung on

lines around the grave, where they bore witness to the donors' conspicuous consumption. It was only in the second half of the 20th century that serious attention was drawn to the commodification of death in relation to the American undertaking business.

Jessica Mitford's book *The American Way of Death,* first published in 1963, radically changed the public image of the funeral industry. Allegedly the industry exploited the grief-stricken and vulnerable survivors of the newly dead. Scheming to maximize their profit, in Mitford's view, undertakers had cleverly developed many ways to overcharge their customers and even sell them goods and services they might not need. The best-selling book had a long-lasting impact on the public's view of the funeral industry. Earlier, novelist Evelyn Waugh, in his 1948 book *The Loved One*, painted a bleak picture of the undertaking business in southern California, where the commodification of death was taken to its extreme. No matter if the corpse was disfigured, it had to be embalmed and displayed in an expensive casket. Memorable from Mitford's book are the tactics employed in the sale of coffins and the money that could be made from offering costly final destinations for the human remains and their memorialization. She also put the necessity of embalming, key to "the American way of death," under scrutiny.

Recently Gary Laderman reviewed the shockwave that Mitford's book sent through the industry in his history of the funeral home in 20th century America, titled *Rest in Peace*. Laderman lets the undertaking business off the hook. The position of the undertakers (or funeral directors, as they later became known) was a vulnerable one because they were dealing with death. Many felt that commerce should not intermingle with this deeply felt human experience. What is more, undertakers handled corpses behind the scenes, and exactly what they did with the bodies became a figment of the popular imagination. The general public's ambivalence toward death, rather than the exceptional cases of exploitation, appears to have been the main reason for the emergence of a negative stereotype of the profession. According to Laderman, Mitford's exposé of the tricks of the trade met with its great success because the author had woven this stereotype into her account. Laderman, to the contrary, stresses that Mitford turned a blind eye to the cultural motivations of the customers. Furthermore, he notes that in actual practice, undertakers developed good contacts, if not relations of trust, with other members of the community.

Increased organization and rationalization of the undertaking business contributed to a nationwide uniformity of funerals. It also led to the formation of larger companies, and even multinational corporations that took over family-owned funeral homes. The conglomerates in turn were unfavorably compared to the small and more personal, community-based funeral homes. Changes in the U.S. immigration policy forced the funeral industry to cater to consumers from various ethnic and religious groups, as well as the subsequently increasing popularity of cremation. At the same time, changing consumer desires offered the industry the opportunity to sell a proliferation of services and goods. This was also a result of fiercer competition due to increased life expectancy and more people entering the business. Undertakers kept control over the corpses, but the stigma evaporated to a large extent because death was embraced by popular culture, and mortuary rites turned into celebrations of the deceased's life. Although secularization made inroads, and cremation and the preservation or scattering of ashes were added to the repertoire, the funeral directors remained the ritual specialists dealing with the dead. While being innovative in accommodating a plethora of consumer desires and new ritual gestures and goods, they stuck to the old pattern. In spite of criticism, the commodification of death thus did not disappear; to the contrary, it increased.

Similar developments occurred elsewhere, such as in the Netherlands, even though embalming is not a standing practice there yet. Remarkably, the support provided by the funeral industry in the Netherlands to ordinary people to conduct death rites themselves is in striking contrast to the situation in Japan, where the acquisition and control of funeral knowledge by the industry has discouraged ordinary people from doing so. The transition from "community funeral" to "commercial funeral" in Japan has been analyzed by Hikaru Suzuki in *The Price of Death*. In another way, a commodification of death occurred in Oaxaca, Mexico, with regard

to the Day of the Dead, frequented by many tourists every year who are eager to buy commodities and souvenirs related to the annual death ritual. The mortuary rites and artifacts of the Torajans of Sulawesi, Indonesia, are another example of commodification in relation to tourism.

Funerary fairs and open days of funeral homes and crematoria showcase the commodification of death in the Netherlands, as they do elsewhere, to potential customers. An ever-expanding and wide range of goods and services have become available. These include special meals (e.g., champagne and oysters), various means of transport (such as an old-fashioned carriage with horses, bicycles, or bus and limousine), all kinds of caskets (or just a plank or shroud and cradle-like baskets for stillborns), manifold floral arrangements, mourning jewelry containing ashes, grave gifts such as cuddle toys and various placatory gifts, headstones and statues. In some European countries a substantial proportion of business relating to the floral business is related to flowers for the dead. Artificial flowers, made in the People's Republic of China, also figure in the traditionally oriented death rites of the aforementioned Tiwi.

Interestingly, once commodities, such as teddy bears and other cuddle toys, have served the function of grave gifts, they can no longer be treated as commodities. The act or ritual gesture takes them out of circulation. It makes the objects sacrosanct. Death thus provides an important context for decommodification. In this context commodities acquire new and priceless values that put them beyond reach of market transactions.

Communal Bereavement

Communal bereavement is the widespread experience of grief and distress felt among people who did not know and never met the deceased. It is expressed in mass gatherings of mourners, such as vigils or memorial services. Mass acts of condolence for the deceased and their loved ones, such as leaving notes, flowers, or other gifts and mementos at symbolically important locations, are also manifestations of communal bereavement.

The critical aspect of communal bereavement is that many of the mourners do not personally know the deceased person or persons. Moreover, many of those experiencing communal bereavement did not have a direct social tie to the deceased person or persons. With communal bereavement, the grief and distress extend beyond the social network of the departed to the larger community. This aspect of the phenomenon makes it communal.

Examples of Communal Bereavement

Communal bereavement most commonly occurs after tragic—often violent—unforeseen deaths. In particular, communal bereavement is most common when an act calls into question the basic values or commonly held perceptions of the community. Community bereavement is also common when institutions vital to the normal functioning of a community fail to competently perform essential tasks, especially tasks central to the provision of security. It also occurs after the deaths of popular political figures, such as Diana, Princess of Wales, or Argentinean First Lady Eva Perón. Communal bereavement may also occur after the death of popular cultural icons, such as what occurred after singer John Lennon was murdered.

Among the most common causes of communal bereavement are acts of mass violence that result in large numbers of victims. For example, widespread communal bereavement took place after the 1995 bombing of the Alfred P. Murrah Federal Building in Oklahoma City, Oklahoma. This terrorist attack killed 168 people and injured over 800 others; yet, the grieving extended far beyond those victims and their immediate social circle. Similarly, the 9/11 terrorist attacks against the United States, which resulted in nearly 3,000 deaths, caused people worldwide to experience grief and express their sorrow. People in towns and on college campuses across the globe held vigils and made other expressions of communal bereavement after the mass murder of 32 students and faculty members on the Virginia Tech campus in April 2007. Similar scenes were witnessed after the February 2008 shooting at Northern Illinois University that resulted in five murdered students. Across the nation's universities and colleges, students offered support by conducting their own vigils and memorial services. The 1999 Columbine High School (Colorado) shootings also resulted in widespread communal bereavement.

Natural disasters can also result in communal bereavement. Thousands of people worldwide expressed distress after Hurricanes Katrina and Rita devastated the American Gulf Coast. Similarly, the 2004 tsunami that killed nearly 230,000 people in 11 countries led to worldwide communal bereavement. The sheer destruction caused by these events was likely sufficient to cause communal bereavement, yet these events also raised issues of the competency of our institutions to protect us from natural disasters.

Although "routine crimes" such as a murder with one or two victims typically do not lead to widespread communal bereavement, it does occasionally occur when the "routine crime" is particularly heinous and offends strongly held collective sentiments. For example, after Susan Smith murdered her two young sons by drowning them in a South Carolina lake, thousands of people across the United States and around the world expressed their grief by placing flowers, small gifts, and letters at the shores of the lake. A similar example of communal bereavement for a lone victim occurred in February 2000. When a classmate fatally shot Kayla Rolland, a 6-year-old student at Buell Elementary School in Flint, Michigan, the community openly mourned. Nearly 1,000 residents expressed their grief at vigils, memorials, and her funeral.

Outcomes of Communal Bereavement: Distress at the Individual Level

Research on the effects of widespread distress associated with communal bereavement has identified a number of negative outcomes at the individual level. Communal bereavement can produce effects on both the body and mind of those who experience it by producing stress and can lead to a number of somatic illnesses associated with stress. For example, Ralph Catalano and Terry Hartig report that shortly after an assailant shot Swedish Prime Minister Olof Palme on February 28, 1986, 26% of surveyed Swedes cried and 10% reported feeling sick. To explore whether the prime minister's death caused more severe health problems, these analysts tested the hypothesis that the incidence of very low birthweight babies rose significantly in Sweden immediately after the assassination. They also hypothesized that low birthweight births would increase after the death of 852 persons in the sinking of the ferry Estonia in 1994. Analyzing quarterly data from 1973 to 1995, the researchers found that the Palme assassination was associated with approximately a 21% increase in the quarterly incidence of live births of infants weighing less than 1,500 grams (the clinical definition of very low birthweight). The sinking of the Estonia was associated with an increase of approximately 15% in low birthweight births. These effects were observed even after controlling for other stressful events, such as male unemployment rate, average temperature, and other relevant factors.

Researchers found similar effects on birthweight after the 9/11 terrorist attacks. In New York City, there was an increase in very low and moderately low birthweight babies after the attack. While the effects were not as strong, the 9/11 attacks were also associated with increased chances of very low birthweight in upstate New York. It was concluded that the communal bereavement associated with the terrorist attacks affected individuals far beyond those who witnessed the event. The widespread communal bereavement associated with the 9/11

attacks also appear to be associated with a drop in the male-to-female sex ratio in both California and New York. Apparently, even in individuals who did not know the victims, communal bereavement produces stress hormones that can induce spontaneous abortions and premature labor.

In addition to effects on physical health, communal bereavement may produce adverse mental health effects. Researchers in South Australia found a dramatic increase in the request for, and use of, grief support and counseling services 3 weeks following Princess Diana's death. After the Oklahoma City bombing it was reported that among more than 3,000 Oklahoma City area students, those with close relatives who were injured or killed in the bombing had higher posttraumatic stress levels. However, levels of posttraumatic stress disorder also were elevated even for those who did not have close relatives injured or killed in the attack. Similarly, approximately 6 months after the 9/11 terrorist attacks, 1 in 4 of approximately 8,000 New York City children studied demonstrated anxiety and emotional symptoms related to the attacks. Mental health services at Virginia Tech reported an increase in requests for services after the mass shooting that occurred there. The request for counseling services was significantly higher when students returned for classes the following fall than in previous fall semesters.

Researchers have frequently found gender differences when analyzing the impact of communal bereavement on physical and mental health. In general, females are more likely to experience health problems than are males. Among the children evaluated for posttraumatic stress disorder after the Oklahoma City bombing, there were significant differences, with girls having higher symptom levels than boys. Similarly, girls reported a significantly higher level of fear after the 9/11 attacks than did boys. Among students who did not personally know a victim of the Virginia Tech shootings, females were nearly twice as likely to seek counseling after the tragedy as were males.

Regardless of the nature of the effect, this line of research highlights that communal bereavement leads to heightened stress. In turn, increased stress levels cause somatic illnesses and adverse mental health effects. This research implies that the effects of tragedies and disasters extend far beyond those directly associated with the events.

Outcomes of Communal Bereavement: Solidarity at the Community Level

While communal bereavement is associated with individual-level distress, it also acts as a source of community solidarity or cohesion. What leads to an increase in solidarity is the intensity of social interactions that transpire after tragic events or disasters. Events that cause widespread communal bereavement typically produce collective responses. For example, on the day after the murders at Virginia Tech, over 10,000 people attended a convocation held to honor the victims. That night, thousands of people attended a candlelight vigil. On the Saturday after the tragedy, thousands of students and town residents attended a picnic hosted by a community group on the university's campus.

As large numbers of persons focus their attention on the event and participate in mass rituals of communal bereavement, a collective mood sweeps over them. Because the sentiments that were violated are widely held and respected, violation of them threatens the group's collective identity. The collective, in turn, resists this threat by acting collectively. This collective action promotes the group's solidarity and enhances its unity.

There are numerous examples of widespread communal bereavement resulting in heightened group solidarity, such as the surge in social solidarity observed after the 9/11 terrorist attacks. The elevated levels of solidarity, expressed through heightened levels of nationalism and national pride, lasted approximately 6 months after the attacks. By 9 months after the attack, levels of solidarity had returned to their preattack levels. Similarly, social solidarity increased significantly after the Virginia Tech shootings. Comparing data measuring levels of community solidarity that were collected in 2006 with similar data collected after the tragedy, researchers found that levels of solidarity increased by over 20%.

Like the individual-level effects of communal bereavement, the solidarity-producing effects of communal bereavement may vary across subgroups. Among a sample of undergraduate students at a small liberal arts college, the boost in patriotism after 9/11 was much more marked among

white students than among black students. As compared to black students, white students were 4 times more likely to say that the attack greatly increased their feelings of patriotism. Moreover, white students were twice as likely to believe that the attacks precipitated closer bonds to others. Despite these differences, all students in the study felt heightened levels of patriotism and solidarity.

The increased solidarity associated with widespread communal bereavement serves as a protective factor for the members of the community experiencing the trauma. Enhanced community solidarity helps foster and sustain social support networks that can reduce the adverse effects of communal bereavement as the relatively unstressed community members provide coping resources to those community members who experience more stress. Research on tragedies and disasters reports remarkably consistent findings regarding the ability of people to rely on existing informal support networks to help them through the bereavement process. These findings hold true regardless of the type of disaster or the country affected by the tragedy. Because of this consistent finding, mental health practitioners who respond to mass tragedies include "connection with social supports" as one of the primary goals of "psychological first aid." Thus, a comprehensive community health response to disasters should reduce distress by structuring opportunities for contacts with primary support persons or other sources of support, including family members, friends, and community members. Research clearly indicates that utilizing social support networks can reduce the adverse effects of communal bereavement. But even with social support, some members who experience communal bereavement are unable to avoid the onset of somatic illness or mental health problems.

Communicating With the Dead

Humans relate to the dead in a variety of ways, which may or may not entail an experience of communicating with the dead. As communication is an inherently social activity, the ways in which communicating with the dead has been socially framed are addressed first, before going on to look at those cultures that provide no such frame, and finally certain experiences that are seemingly unframed. The entry takes the stance of the anthropologist or student of religion who attempts to describe human experience; the entry neither reduces experiences of communicating with the dead to biological or psychological processes, nor considers whether they could provide evidence of the supernatural.

Socially Framed Communications

Mutual Care

In many societies, there is a relationship of mutual care between the living and the dead. The dead need the help of the living on their journey to heaven (as in Catholic and Orthodox Christianity) or to the status of ancestor (as in much of East Asia). Catholics, for example, pray to the saints (a particular category of authenticated pious dead) for the souls of those they care for. In Japan, offerings are made to the dead at certain places (the household shrine or public Shinto shrines) and certain times (the O'Bon Festival in mid-August when the dead return to earth). In return, the dead are consulted for guidance, again typically at these times and places. A *shrine* is a place where the living may care for, and be guided by, the dead.

In a number of cultures and religions, distinctions are made between the recent dead and those who have become ancestors, typically after two generations have passed and there are few if any living who personally remember them. Among the Shona of Zimbabwe, for example, supplications are made to the ancestral spirits (the long dead) through the intermediary of the living dead (the recent dead). Ancestorhood usually reflects not personal affection for the deceased but the continuance beyond the grave of familial authority relations; in Africa, this relation with the ancestor may be more one of fear than of care.

In addition to these family ancestors, there are also the sacred dead legitimated by powerful institutions such as the state (national heroes, the war dead) or the church (saints); communications with these sacred dead are controlled by the relevant institution. In Japan, those who have died in war for their country attain the status of divinities, and so care between the living and the dead is particularly pronounced in rites performed at the Yasukuni national shrine for the war dead.

Reincarnation Within the Family

In a number of African and North American Pacific Coast societies, there is a belief that the spirit and character of a dead person may be transferred to a living child or newborn baby. Among the Shona, a child may be given the name of a living grandparent, and be related to as though he or she were the grandparent; after the elder's death, the child receives the personal character of the deceased. In such societies, there is a strong sense that the dead can manifest themselves within the living, and by implication take part in the communications of everyday life. In Western countries without this tradition, there is the idea of a child bearing a strong likeness to an older relative, but this is explained in terms of genes, and, as Roland Barthes has observed, photographs comprise a way in which the dead manifest themselves among the living.

Continuing Bonds With the Dead

In many societies, the boundary between the living and the dead is relatively permeable, and it is accepted that the living may chat to the dead. This is, for example, normal and even expected behavior at a Japanese household shrine. Even in communist, secular China, guidance may be sought about business decisions from the ancestors, and in Japan an office building may have its own shrine. This is common in societies where filial piety is strong: The elders are respected and their advice sought in life, and there is no reason why this should cease in death. This assists the living and legitimates respect for elders.

The Unquiet Dead

If the dead are expected to journey steadily away from the material land of the living—whether in the direction of heaven, reincarnation, or ancestorhood—this journey may be impeded by a number of factors. The living may cling to them, and the dead may cling to life. They may have died suddenly or violently, or been denied the correct rituals on their deathbed or at the funeral. Others may have no living descendents. These lonely, troubled dead hang around, too close to earth for our comfort or their good. Though ghosts are not always of this troubled nature, seeing or hearing a ghost or vampire can in some societies be taken as evidence that a particular deceased person is not at peace. They require rituals to send them correctly on their way. Exorcising a haunted house, for example, is believed to put a stop to unwanted visits by the dead.

Throughout the 20th century in England, many who visited mediums or a spiritualist church were concerned about the unquiet state of a deceased relative, such as a child who had died violently. (Spiritualism was very popular after World War I.) The message received from the other side in spiritualist churches in England today is typically, "He's okay, he loves you, and wants you to get on with your life."

The Banned Dead

The Judeo-Christian tradition has banned the use of mediums to contact the dead. Judaism memorializes the dead but discourages active communication with them. For Catholic and Orthodox Christians, the saints may be contacted through the prayers of the church, while in Protestantism all contact with the dead is wrong—though some individual Christians on occasion quietly consult

mediums. Other belief systems, such as secular materialism, state that it is impossible for the living and the dead to communicate with each other, because the dead no longer exist. Hence the historically Protestant, now largely secular, societies of northwest Europe and, to an extent, North America, have little space for communication with the dead.

If contact with the dead is impossible, or wrong, then people are left largely with memory. This is all there is, as the dead cannot be cared for, feared, or prayed to. So in the West there are war memorials, where the living remember those who sacrificed their lives; in contrast, Japan has shrines where the living can care for the war dead and be guided by them.

Even in societies that ban contact with the dead, people may have some of the experiences discussed in earlier sections of this entry. They may pursue the experience, but in private, as it is not socially validated. A mourner may talk to a deceased husband, parent, or child, but privately, or at the graveside when there are few people around. Caring for the grave, by keeping it clean and the flowers fresh, may be experienced as a way of continuing to care for the person.

In Anglo American society, which largely bans the dead, subcultures have developed that feature communications with the dead. Ghost stories, haunted houses, jangling skeletons, and gothic misty churchyards have been part of English and American literary and popular culture since the late 17th century and continue today in British goth subculture and in Hollywood horror movies. All these are largely absent in Catholic Mediterranean Europe or, if present, are recognized as Anglo imports.

Modern Western societies, especially U.S. society, have, however, instituted one particular way in which the dead leave powerful messages for the living, namely philanthropy. Philanthropists leave exceptionally clear instructions for how their postmortem fortunes are to fund good causes, and would-be recipients must listen carefully to the deceased's conditions if they are to be successful in their bids for funds.

Since the 1990s, secular psychological theories of grief allow that mourners may continue various kinds of bonds with the dead. This opens up a space in which even secular materialists and devout Protestants can accept relationships, if not actual communication, with the dead. Without formal religious legitimation, however, these continuing bonds are seen as just a psychological need.

Other Communications

Other communications are highly individual and, less obviously, either socially framed or culturally banned. They are also more closely tied to dying and mourning.

Nearing death awareness is when someone on their deathbed reports an experience that includes a deceased family member, who may appear to be welcoming them. In Britain, such experiences are rarely reported to doctors, more often to nurses or family carers; in Ireland, such experiences are well known and part of folk culture.

Near-death experiences occur when someone is clinically dead, often because of a sudden cardiac arrest, and include a range of experiences, one of which is a sense of going down a tunnel at the end of which is an image of light, often interpreted as an angel or a divinity. The figure is rarely, however, interpreted as a known deceased and therefore cannot properly be counted as a communication with the dead.

The sense of presence is the perception, through sight, sound, or smell, of a deceased loved one. It comes unbidden, and is therefore different from employing a medium to contact the dead. It may occur months, years, or decades after the death. Like the near-death experience, it has been well-documented over the past 40 years. Whereas earlier researchers found that informants often said they had not previously mentioned the experience to anyone, this is now not the case; the sense of presence seems to be gaining a measure of legitimacy.

Explanations

There are two kinds of popular literature about nearing death awareness, near-death experiences and the sense of presence. On the one hand, rationalists attempt to explain them in terms of psychology or biology. Thus the sense of presence is seen as a part of the grief process, or the near-death experience is explained in terms of brain chemistry. On the other hand, supernaturalists use such experiences as evidence of God or the supernatural.

Both rationalists and supernaturalists are entitled to their views, but a social science approach is different. Because every human experience undeniably has a biological component, there is clear merit in exploring the biochemistry of unusual experiences; and throughout history, unusual experiences have shaped religious beliefs. But to *reduce* experience to biology, or to see it as *proof* of the supernatural, are both acts of faith. Alternatively, communications with the dead can be seen as, in the broadest sense, religious experiences. The social scientist may document these experiences, both from the inside (by gathering first-hand narratives and by participant observation) and from the outside (by documenting the legitimation, pathologicalization, and cultural history of such experiences).

Condolences

When someone who is cared about suffers the loss of a loved one, it is appropriate to offer condolences, or expressions of sympathy. Though condolences may be delivered by way of conversation, it is the letter of condolence that has received more popular and scholarly attention. The letter of condolence dates back at least as far as 45 B.C.E., when Servius Sulpicius Rufus wrote to console Marcus Tullius Cicero upon the death of his daughter during childbirth.

Any communication regarding a devastating event has the potential to be upsetting. Therefore, though a letter of condolence should be honest and heartfelt, some degree of planning and foresight might be appropriate to help ensure that its actual impacts are the intended positive ones. Understanding the common features and foibles found in exemplary letters of condolence may improve the odds of creating and appreciating effective ones.

Common Features of the Letter of Condolence

An offering of condolence will generally include acknowledgment of the loss and grief of its target as well as an expression of empathy, sympathy, or both. It will often also provide an effort aimed at comforting the bereaved.

It is standard form to disclose one's emotions about the loss with statements such as, "I am so sorry" or "I share in grieving." Moderation and brevity are valued in letters of a sensitive nature, especially when concerning the expression of emotion. It is likely that overwrought portrayals of hair-pulling anguish will not be comforting to the bereaved.

Statements asserting that the deceased was appreciated, lived a good and worthwhile life, and will be missed by others may be of great consolation to those in mourning. Therefore, consolers are well-advised to note admirable qualities and values of the deceased and to revisit special memories. Recognition of the void left by the loss of the person may be counterbalanced by determination to preserve the relationship with that person. The bereaved may be comforted to know that the deceased will be "kept alive" in the thoughts, values, and actions of others.

Those who offer condolences should be careful not to assume they are privy to the feelings of the grieving target. So, statements like "I'm sure you are devastated" or "You must be beside yourself"

should be avoided. Moreover, the fine line between empathy and sympathy should be respected. One should only claim to know what the experience is like if one has already been subjected to it.

Comfort may be derived from nonspecific offers to help the bereaved. It would be presumptuous to expect that every survivor of grief would find equal value in the same form of assistance. Though a consoler's specialty may be cooking, an offer to bring food may or may not be appreciated. It is better to express one's willingness to help either in general or across a range of options, such as a physical act of assistance, through conversation, or just by being available when needed.

In reviews of condolences, scholars have identified less common alternative inclusions. The first of these is to share one's own grief accounts to offer insights or exhibit sympathy by way of solidarity. Another device included in some letters of condolence is the citing of a well-chosen reading from literature or scripture. Finally, some consolers provide potentially helpful perspectives on the loss by imparting a philosophy about life, death, or both. Care should be taken not to espouse religious beliefs that are contrary to those of the reader.

Brevity is likely to be a virtue within the letter or note of condolence. Long-winded, overly detailed stories about the deceased should be parsed down. Indicators of emotions should be expressed briefly with vivid terms such as used in the statement, "I was shocked and dismayed by your loss." Updates about one's own family and circumstances should be saved for a future correspondence.

Rather than the pedestrian "Sincerely" or "Yours truly," letters of condolence often conclude with a phrase such as "We are all thinking constantly about you" or "Your family has my sincerest sympathy and regards."

Exemplary Letters of Condolence

The authors of some noteworthy letters of condolence stand out for their exquisite renderings of grief and emotion. Thomas Jefferson told John Adams, upon the death of the latter's wife, Abigail, that "I will not by useless condolences, open afresh the sluices of your grief." To console Thomas Mann, whose son committed suicide, Herman Hesse wrote, "Like all your friends, we have received the sad news with consternation and profound sympathy."

Some letters offer praise amid their touching portrayals of the lives and characters of the deceased they mourned. Sir Samuel Hoare wrote Neville Chamberlain's widow that of all the public men he had known, Chamberlain was the most humble and had "nothing artificial or insincere about him." Robert Louis Stevenson told Charles Baxter his father was "one of the best, the kindest, and the most genial men I ever knew."

Others provide a helpful perspective of death as the end of suffering, the desire of a greater being, or the beginning of a superior state of being. Ralph Waldo Emerson wrote about Jane Carlyle to Thomas Carlyle, "I must think her fortunate also in this gentle departure, as she had been in her serene and honoured career . . . and you will have the peace of knowing her safe and no longer a victim." Benjamin Franklin reminded his niece when her father died that "it is the will of God and Nature that these mortal bodies be laid aside, while the soul is to enter into real life."

Finally, writers of notable letters of condolence sometimes offer support in the form of general aid and assistance. John Donne told his mother, upon the loss of the last of his five siblings, "I do, and ever shall, esteem myself to you and provide for your relief." Emily Dickinson reminded a bereaved friend, "When not inconvenient to your heart, please remember us, and let us help you carry it, if you grow tired."

Confucian Beliefs and Traditions

Confucianism can be characterized as a nontheistic and humanistic religion, with no rigid creed system and yet with rich systems of ritual. In Confucianism, what one believes is subordinate to what one practices. This distinctive aspect of the Confucian tradition has induced a context in which disparate ideas and beliefs could have coexisted, and yet a uniform system of ritual has been established through ritual manuals. Similarly, there has been a wide spectrum of ideas about death and the afterlife, but the Confucian tradition has established standardized death rites that involve the funeral and ancestral ritual. They have been considered as the most essential rituals in Confucian life, their primary rationale being the fulfillment of "filial piety," one of the core Confucian values.

The Confucian Approach

The *Analects,* the most important and influential book among the Confucian corpus, includes a short dialogue between Confucius and one of his disciples about death and serving the spirits of the dead. When Confucius is asked about serving the spirits of the dead, he says that while we are not yet able to serve fellow human beings, how can we serve the spirits of the dead? In response to a question on death and the afterlife, Confucius remarks that while we do not yet know life, how can we know death and the afterlife? This dialogue shows not so much Confucius's agnostic attitude toward death and the spirits of the dead as his primary concern with human life in this world. Given the importance of the *Analects* within the Confucian tradition, it is not difficult to recognize the extent to which those statements have influenced later Confucian discourse on the issue of death and the afterlife. In fact, that short dialogue sums up the basic approach of the entire Confucian tradition toward the issue. One could even argue that it epitomizes the general characteristics of the whole Confucian tradition: That is, while not being indifferent to the issues of supernatural beings and life after death, Confucianism is more concerned with human society in this world. In the humanistic framework of Confucian thinking, therefore, the issue of whether there is an afterlife and whether the spirits of the dead continue to exist is secondary to more primary concerns such as the issue of self-cultivation and social participation.

This, however, is not to say that Confucianism has little discourse and practice in relation to death. On the contrary, from its earliest early period, the Confucian tradition produced a variety of ideas about death and the afterlife, ranging from belief in the continued existence of ancestral spirits, to an agnostic approach, and to disbelief in the afterlife. In general terms, the latter view became dominant in later Confucianism, which claims that human spirits disperse soon after death. Admittedly, the issue of death and the afterlife has not occupied the principal place in Confucian scholars' thinking, and the Confucian tradition has not produced unified systems of thought or belief in relation to death and the afterlife. The Confucian tradition, however, has developed a sophisticated system of death rites, perhaps the most sophisticated among major world religions, involving the funeral and ancestral rites.

Ritual lies at the heart of the Confucian tradition to the extent that Confucianism could be described as a religion of ritual. Confucians have ritualized all domains of life and have emphasized ritual practice as a crucial means of realizing Confucian ideals such as self-cultivation and social harmony. The simple fact that ritual texts (i.e., the *Book of Rites,* the *Ceremonials,* and the *Institutes of Zhou*) were included in the Five Classics exemplifies the significance that ritual has taken in the Confucian tradition—the other four titles of the Five Classics are the *Book of Changes,* the *Book of History,* the *Book of Poetry,* and the *Spring and Autumn Annals*. Confucius has always been regarded as an expert on ritual and, following his example, many subsequent Confucian scholars have immersed themselves in the study and practice of ritual. Of the various Confucian rituals,

particularly influential in the life of ordinary people and the elite alike have been death rites—the funeral and ancestral ritual. These, along with two other rituals of cappings (coming of age) and weddings, constitute the four Confucian family rituals. Death rites have been the most important among the four family rituals. The extent to which death rites are important in the Confucian tradition can be illustrated by a simple fact that Zhu Xi's *Family Rituals*, one of the most influential ritual manuals in East Asia, allocates some 87% of the main text for chapters dealing with the funeral and ancestral rites. As a ritual expression of "filial piety," they have constituted the foundational rituals of the Confucian family and society.

Funerals

The Confucian funeral uses burial as its method of body disposal. While Buddhists cremate their dead in the hope that they would reach paradise without delay, Confucians practice burial in the expectation that the body be returned intact to the ancestors: Confucians oppose cremation as it is considered degrading to the parents' bodies and thus against Confucian teachings of filial piety. For Confucians, a well-preserved grave is understood as an expression of filial piety as well as a guarantee for the well-being of both the dead and the living. An influential and yet controversial practice in relation to burial concerns what is commonly translated as "geomancy" in Western literature. Its East Asian equivalent, *fengshui* in Chinese and *pungsu* in Korean, literally means "wind and water" and is basically concerned with choosing auspicious sites for the living (i.e., when building houses, planning cities, and locating temples and shrines) and for the dead (i.e., when situating graves). In particular, the theory and practice of grave geomancy has deeply influenced the life of ordinary people and intellectuals alike in East Asia. Throughout history, Confucian scholars have shown various attitudes toward this grave geomancy ranging from the very critical to the favorable. For instance, while Zhang Zai (1020–1077) and Cheng Yi (1033–1107) considered geomancy irrational, Zhu Xi (1130–1200) upheld the practice of geomancy and observed it himself, especially in burying his family members. Zhu Xi also wrote a geomantic *Discourse on Royal Tombs* (*Shanling yizhuang*), which was presented to the Chinese emperor in 1194. During the Joseon dynasty of Korea (1392–1910), the most Confucianized state in history, many Confucian scholars were experts on geomancy and accepted the practice of geomancy to varying degrees. In imitation of the Confucian elite and also as part of popular folk practice, grave geomancy became prevalent among ordinary people during the Confucian dynasty. The Korean people were so careful in choosing burial sites that they would even delay the funeral until they could find a good burial ground. Indeed, they would go anywhere in order to find an auspicious site. The theory and practice of geomancy is still influential in contemporary East Asian society. According to a 2005 Korea Gallup survey, for example, some 37% of the respondents believed the theory of grave geomancy summarized in a sentence such as "If ancestors are buried in an auspicious site, their descendants will prosper in this world."

Another distinctive aspect of the Confucian funeral concerns a sophisticated practice of mourning garments and mourning periods, which varies depending on the kin relationship between the deceased and the mourner. According to their relationship to the deceased, bereaved family members and relatives wear different mourning garments during the funeral and have different mourning periods. This complicated system of mourning garments and periods is detailed in the manuals of Confucian family rituals, for example, Zhu Xi's *Family Rituals*. Bereaved family members should wear mourning garments from the moment when the body of the deceased is placed in a coffin. Mourning garments are prepared for all the paternal relatives who are related within eight degrees of kinship and for some maternal and other relatives such as sons-in-law. Those mourning garments are made of slightly bleached hemp and consist of four main parts in the case of men's full apparel: a cap, a coat, leggings, and straw shoes. There are commonly five levels of wearing mourning garments determined by the relationship between the deceased and mourners. For example, the sons and firstborn grandsons of the deceased wear the full apparel, while the nephews and cousins of the deceased wear the cap and the leggings but not the coat or the straw shoes. Relatives of the fifth and sixth degrees—first cousins once

removed and second cousins—wear only the cap. The groups of kinsmen belonging to the seventh- and eighth-degree relatives have to attend the funeral but are not required to wear mourning garments. Likewise, the mourning period varies depending on the relationship with the deceased and it is also divided into five kinds, namely, 3 years, 1 year, 9 months, 5 months, and 3 months. The following are some examples. The mourning period for parents' death is 3 years, the longest mourning period. It is 1 year for paternal grandparents' death while it is 5 months for maternal grandparents' death. It is also 1 year for the death of wife, brother (5 months for brother's wife), and sister (if the sister is married, it is 9 months).

Ancestral Rites

Ancestral ritual is the most important of the four Confucian family rituals. Indeed, the other three rituals are basically directed to the practice of ancestral rites, and all four family rituals are to be held in front of the domestic ancestral shrine. After all, the duties of adulthood are oriented to those of marriage, and marriage is understood as a means of producing the ritual heir (the son), the only legitimate person who can continue the tradition of ancestral rites. In general terms, there are four kinds of Confucian ancestral ritual: anniversary-of-death ritual, seasonal ritual, special ritual on holidays like New Year's Day, and gravesite ritual. Confucians commonly perform anniversary-of-death rituals for four ascending generations: parents, grandparents, great-grandparents, and great-great-grandparents. It means that they perform ancestral rites at least eight times a year for anniversary-of-death rituals alone, plus four seasonal rituals, at least two holiday rituals and a gravesite ritual. The key rationale for the practice of these various ancestral rites lies in the expression of reverence and piety toward ancestors (i.e., the root of one's existence), rather than the exercise of belief in the existence of ancestral spirits. Providing regular and frequent opportunities for all the family members to gather together, ancestral rites also have become one of the most significant educational occasions for transmitting family tradition on to the next generation. Through the regular practice of the ritual, participants embody and express their generational status and role, thereby intensifying individual identity and family solidarity as well as assuring the transmission of family tradition.

Coping With the Loss of Loved Ones

To be involved in close relationships inevitably means that one will eventually experience the loss of a loved one. Those who experience such loss are usually surrounded by people in mourning, which is a powerful and stressful emotional state that is rooted in the unconscious psychological reactions to a loss. Grief, although not considered an illness, may nevertheless be so severe as to jeopardize the individual's life. There is no time

frame for grief and, in some cases, it involves subtle factors that can result in self-destructive behavior in the grieving person. Such self-destructive behavior may involve alcohol or drug abuse, malnutrition, disorders related to the neglect of oneself, including the disregard of a prescribed medical regimen or commonsense precautions, and even a seemingly unconscious boredom with life. Successful coping with the loss of a loved one is critical to maintaining the course of social activity.

There are different reactions to the death of a loved one, depending on the age, marital status, social class, ethnicity, and the circumstances of those left behind. The death of a child is a devastating experience for parents. The death of a spouse or a partner involves the loss of a chosen relationship, companion, lover, parent of one's children, friend, and soulmate. Such loss can result in feelings of disorientation, uncertainty, and confusion as one may need to take on roles and tasks previously carried out by the deceased.

Premature Death

Premature death may be incurred in various ways—deliberately by human hands (such as in homicide, suicide, war, and death sentences meted out by the State), as a result of nonhuman creatures (e.g., bacteria and animals), or as a result of accidents. Loved ones who have lost a significant other as a result of suicide are generally called "survivors." Among people who have lost a loved one, survivors of suicide represent the largest group of mental health casualties. The loss of a loved one by suicide is often shocking, painful, and unexpected, and the grief that ensues can be intense, complex, and long term.

In the case of the sudden death of a loved one due to unexpected events, such as natural disasters including earthquakes, large-scale explosions, or disasters in general, there are unique reactions to the event. The "disaster syndrome" consists of a combination of emotional dullness, unresponsiveness to outer stimulation, and inhibition of activity. Individuals who have just experienced a disaster are apt to suffer from at least a transitory sense of worthlessness, and their usual capacity for self-love becomes impaired. In other cases, psychic shock is a common reaction followed by motor retardation, flattening of affect, somnolence, amnesia, and suggestibility. Moreover, a process of "psychic closing off" has been reported in loved ones who lost a dear person in a catastrophic event; this closing off can last from days to even months or can become a more lasting psychic numbing.

Although most people adjust to the trauma surrounding the death of a loved one, and are able to successfully move on to live full and satisfying lives, there are circumstances when adjustment to such loss is difficult. In these cases, acute grief does not resolve (thoughts and memories of the deceased remain accessible but are no longer preoccupying)—the permanence of the loss and the thoughts related to it are neither comprehended nor integrated into attachment-related long-term memory.

Adjustment to the death of a loved one can be complicated by maladaptive attitudes and behaviors. Blame of self or others, fear of the intensity of grief, the prospect of living without the deceased, and a disinclination to engage in activities that were shared with the deceased may impede the resolution of grief. Over the past decade, some investigators studying persons who have persistent symptoms and impairment following bereavement have concluded that there is a syndrome of chronic abnormal grief, also called complicated grief, and recently renamed prolonged grief disorder, a disorder occurring after a loss that causes significant impairments in functioning for at least 6 months. Characterized by either separation distress or cognitive, emotional, and behavioral symptoms such as feelings of confusion or emptiness, it is as if a part of the self has died. There is trouble accepting the loss as real, an inability to trust others, extreme bitterness or anger related to the loss, and avoidance of reminders of the loss. Other features include numbness or absence of emotion; a feeling that life is unfulfilling, empty, and meaningless; and a feeling of being stunned, dazed, or shocked by the loss.

Scholars demonstrate that the symptoms of disordered grief form a syndrome that is distinct from those of depression and anxiety. Characteristic features of such a state include persistent preoccupation with thoughts about the lost person, along with yearning, longing, and an inability to accept the death, distressing intrusive thoughts about the death, and avoidance of reminders of the loss. A major issue is the timely recognition of the transition from normal to abnormal grief as well as what risk factors lead to the emergence of

complicated grief or lead to the development of comorbid disorders such as major depression, anxiety disorders, or somatoform disorders. Recent studies confirm the hypothesis that post-traumatic stress disorder can occur following a natural death. Violent events are time-limited, threaten one's sense of safety, incite fear, and produce hypervigilance to danger.

The loss of a loved one is a permanent ongoing reality that engenders sadness and longing, and produces hypervigilance for the lost person. Images, thoughts, and memories of the deceased, even when intrusive, evoke a bittersweet mix of sadness and yearning. Failure to integrate the information about a violent event may result in post-traumatic stress disorder, while failure to integrate the permanent loss of a loved one may produce complicated grief.

How Children Cope

Children experience grief after the loss of a parent or someone close. Their grief is different from adult grief, as children do not have the same understanding of death. They need to be informed in simple language, with information appropriate for a given age. They should be involved but never obligated to take part in funerals or to observe dead parents or relatives. Children need reassurance and their usual activities and routines should be maintained. Children's knowledge of death varies with age. Under 9 years of age, death is not completely understood as the end of life, but rather it is equated with fear of abandonment or related to magical thinking.

Postvention

Postvention consists of activities that reduce the aftereffects of a traumatic event in the lives of those left behind. Its purpose is to help survivors live longer, more productively, and with less stress. Postventive efforts are not limited to the initial stage of the shock, but rather should be on a day-to-day basis spanning up to a year following the first shock.

Postvention incorporates many tools of psychotherapy, including talk, abreaction, interpretation, reassurance, directions, and even gentle confrontation. The therapist should avoid banal platitudes or the common mistakes often encountered in psychotherapy such as misapplication of the mental examination, for most people who experience grief are not clinically depressed. Common errors that occur are often based on countertransference or a failure to utilize support from within the community. Suicide assessment should always be performed when exploring grief, for there might be fantasies of reunion that fuel suicide wishes. The counselor should play the role of reality tester. Support groups so useful in the healing process can be a helpful source of guidance and understanding as well.

Coroner

The coroner is an elected city or county official and is answerable to the courts. The holder of this office is called upon to undertake medicolegal death investigation, instances involving questionable deaths—those by homicide, suicide, and accident as well as death by natural causes when the decedent had no contact with a physician for a length of time established by a particular jurisdiction. Qualifications for holding the office of coroner vary from one jurisdiction to another, as does the length of time established by local law in which a pertinent death must be reported. The title and duties of coroner have a long history; over time, specific responsibilities have evolved to cover a considerable range of activities.

The information provided by coroner's offices is crucial to both the judicial system and to the recording of public health information. The records and documentation provide vital information about mortality in the United States, information that is used for determining aspects of public health policy as well as serving the need of government, university, and private foundation researchers. In this entry, the history of the title and the duties of coroner are discussed as is the critical role that contemporary media and television crime dramas have had in increasing public interest in this important position.

Origin and History

The word *coroner* originally meant "an officer of the Crown," and the concept dates from medieval times. The edict that formally established the coroner position was Article 20 of the Articles of Eyre September 1194, which stated "In every county of King's realm shall be elected three knights and one clerk, to keep the pleas of the crown." The original Latin is *custos placitorum coronas*, from which the word *coroner* is derived. At the time Hubert Walter, the Chief Justiciar and Archbishop of Canterbury, was temporarily in charge of King Richard the Lion Heart's English kingdom during the king's absence. Archbishop Walter conceived the idea of a death duty, and he created the position of coroner, a person charged with the task of looking into deaths, to make sure that the death duties were paid to the king. When the basic framework of English law came with settlers to the New World, the office and duties of coroner made the crossing as well.

When the English settlers arrived in North America during the 1600s, they brought the coroner system with them. During the next 200 years the coroner became an integral part of death investigation. As the system evolved, change also occurred, especially where the need for enhanced medical knowledge existed. This awareness developed first in England where it was recognized there was a need for medical knowledge to be included in the death investigation. In the mid- to late 1800s, Massachusetts and Maryland passed coroner's acts, which required a physician be present at all death investigations to record any pertinent medical information related to the death.

Death investigation today requires that evidence be collected, coroners conduct an inquest, and valuables and property be collected and safeguarded for return to the rightful owner as opposed to being confiscated as taxes for the Crown.

Influence of the Media

Many people become interested in death investigation through watching television dramas centering on criminal investigations or the coroner's office. Since 2004, a reality show has been shown on the Discovery Health Channel that shows dramatic reenactments of autopsies performed by real-life medical examiner Dr. Jan Garavaglia. Some crime dramas, such as *CSI: Crime Scene Investigation* and *Crossing Jordan,* have had medical examiners as lead characters. The most popular crime drama of this sort appears to have been *Quincy, M.E.* (broadcast from 1976 to 1983), a police drama about a Los Angeles medical examiner who had integrity and a social conscience. Although coroners are not required to solve crimes, Quincy assisted the police detectives in every episode. The show had technical expertise and advisers from the Los Angeles medical examiner's office, and the show was instrumental in bringing attention to many issues and health concerns that had not been addressed in a public forum prior to the origination and airing of this television show. Many coroners and medical examiners report that their reasons for entering the field were prompted in part by watching *Quincy, M.E.* during their youth.

The position of coroner deals with questionable and sudden death, and while some people might describe the occupation as morbid, others understand that coroners are doing a great service to humanity and to their communities. Coroners and their teams put all their resources to the test to find the cause and manner of death in cases of homicide, suicide, accidents, and medically unattended natural deaths. With new crime-solving technologies being developed and implemented, and the increasing number of television dramas focusing attention on this field, many people have become interested in the role of coroner. The work is emotionally challenging and is lacking in glamour, but the work is an essential component of the human experience.

Coroner Qualifications

Jurisdictions vary widely in their qualifications and regulations for coroner. Perhaps the most noticeable difference regarding jurisdictions is that some require a medical examiner system instead of a coroner system. The medical examiner is usually appointed, not elected; may have county, district, or state jurisdiction; and is a licensed physician with training in pathology. The type of system employed, either medical examiner or coroner, may be uniform throughout the state or it may vary from county to county.

There is some debate over whether a physician/medical examiner should conduct death investigations. Given the costs involved in this work, it is not always feasible to justify paying the salary of a physician over a nonphysician in a smaller community. Even when a physician is required, there are some jurisdictions that don't require the physician to be a pathologist. However, only physicians trained in the field of pathology conduct autopsies.

In general, coroners must have a basic understanding of anatomy, physiology, investigative techniques, photography, and medical terminology. The coroner candidate must have excellent written and oral communication skills and be able to supervise pathologists performing autopsies, laboratory technicians, and other office staff. The potential coroner must also have integrity and a good reputation when working with other law enforcement agencies. The person is usually elected for a term of 4 years. In some jurisdictions a coroner may also be the local mortician, sheriff, or county attorney.

Responsibilities of the Coroner

Federal agencies such as the Centers for Disease Control and Prevention depend upon the coroner's office for valuable information and data collected during investigations. The coroner must be notified when a death occurs without any medical attendance; when there is no attending physician; when a physician is unable to state the cause of death; when suicide is suspected, following an injury or an accident; and/or when the death is suspected as a result of a criminal act. In the case of a death by natural causes, many jurisdictions require that the coroner be contacted if a physician had not seen the decedent for a period of 21 to 30 days preceding death.

Most jurisdictions require that the coroner be contacted if a child under the age of 2 years dies suddenly and unexpectedly under circumstances indicating that the death may have been caused by sudden infant death syndrome. In that case, an autopsy is required unless the parent or guardian objects. In most states, the law requires that the death be reported to the coroner, but it is up to the coroner to determine whether or not an investigation will be performed, and if so, what the extent of the investigation will be. An autopsy is required when an individual dies while in the custody of the Department of Corrections. If the results find that the death was unnatural, the coroner will so note this result in the case findings and recommend an inquest.

The Coroner in Action

Duties of the coroner may include notifying next of kin of a death, conducting an investigation, supervising or assisting with an autopsy, meeting with local law enforcement agencies, or testifying at a trial. Acting as an advocate for the deceased, a coroner examines the clues that define the death and is responsible for providing accurate, legally defensible determinations of the causes and circumstances of death, including the identity of the decedent as well as the approximate time of death. Coroners work with the police, forensic pathologists, forensic technicians, attendants, and administrative staff. When a suspicious death is reported, the coroner may personally perform the necessary duties or send investigators to document the scene: to examine the body, interview witnesses, and photograph and sift through the area for clues. Physical evidence, such as the decedent's clothing, is also collected and photographed. Once the investigators are finished at the scene, the body is moved to either a forensic office or mortuary, depending on the jurisdiction. If the cause of death is unknown, the coroner may request an autopsy depending on the circumstances of the death.

Medicolegal death investigation is required by law. Family permission is not usually considered because the law requires that facts and evidence be collected to resolve the issues that might have led to the death. Following a thorough investigation, when sufficient evidence has been gathered, the coroner assigns the cause and manner of death and lists these on the death certificate, referring specifically to the

injury, disease, or toxin that caused the death and whether it was natural or due to accident, suicide, homicide, or undetermined means or circumstances.

Occupational Consequences

Many coroners find death notification to be the most difficult part of the job. Working with the decedent can be much less stressful than having to tell the *living* that a loved one has died. The work of the coroner is far-reaching because each death that is investigated alters the lives of those who have lost a loved one.

Coroners deal with questionable and sudden death; for this reason it is understood that coroners are engaging in essential community, state, and national service. Coroners garner their resources in an attempt to determine the cause and manner of death. The work is not glamorous, but it is necessary and it is required by law.

Coroner's Jury

A coroner's jury is a group of citizens who are summoned to serve as members of an inquest to determine the cause of any accidental or suspicious death that occurs within a specific jurisdiction. The coroner's jury may also be called upon to determine the identity of the deceased person. The coroner's office is responsible for leading the inquest and for investigating the circumstances surrounding the cause of death. An inquest is a legal investigative process that varies somewhat by jurisdiction. The structure and role of a coroner's jury also differ between geopolitical boundaries.

History

Although the coroner's jury is viewed by some as a legal dinosaur left over from the medieval England from which the entity first emerged, the coroner's jury has had an important historical role in the system of justice. One recent examination of the origins of the coroner's jury is complicated. Indeed, in what was probably the first historical consideration of the jury, in 1852 it was argued that the jury did not result from any law of government or theory of justice but gradually grew out of institutional forms that were already present. Some similarities between the coroner's jury and other entities can be identified as dating back to Roman times.

The main elements of a jury are that it decides on the effect of evidence, decisions are made under the sanction of a solemn oath, and the jury is distinct from the court. The first and last elements are particularly important because it means that jurors are concerned with making a decision based on the facts rather than on the complexities of law, which is left to the court.

One of the earliest legislative requirements for a coroner's jury is found in the English De Officio Coronatoris, 4 Edw. I. st. 3 in 1276 that required coroners to request people from four, five, or six of the towns neighboring the scene of death appear before the coroner's court so that they could answer questions of fact about the death. Thus, the coroner's jury started out as people who were selected because of their personal knowledge of the case. Indeed, Sara Butler finds cases where jurors were neighbors of the deceased in cases of suicide and shows how their judgment formed the basis for resolution rather than legal presentation. The role of the jury subsequently changed so that 12 members were required to make judgment on the facts and their decision was required to be

unanimous. Note that the requirement for the agreement of 12 jurors meant that there was no specification on the maximum number, but in contemporary legal systems 12 is the most common number of jurors and, in some jurisdictions, a majority decision will suffice.

English and U.S. coroner's juries were once asked for in all inquests. Thus, the juries are associated with a number of historical characters. In the United States in 1882, for example, a coroner's jury found Wyatt Earp, Doc Holiday, Warren Earp, Texas Jack Johnson, and Sherman McMasters guilty of the murder of Frank Stillwell. In England, Lord Lucan, who disappeared the night his nanny was murdered, was charged in absentia by a coroner's jury in 1975.

The Public Interest

Coroner's juries are not merely a legal historical process; they also play a contemporary role in almost all countries that have a legal system involving juries. A coroner's jury can be used for all inquests, but it is more common for their use to be limited. Although coroners can call upon a jury for any inquest in which they are involved, in most instances a coroner's jury is convened because it is believed there is something unique in the circumstances thought to have led to the death. Thus, any investigation into the cause leading to the death would benefit from the testimony and opinions of learned people within the community.

Legislation requires that a coroner's jury be used in cases that are of public interest. This includes death that occurs when the deceased is detained by the state, such as when imprisoned or in police custody, to ensure against the arbitrary use and abuse of the tremendous power of the state. Furthermore, a coroner's jury may be mandatory in cases that have implications for public health, safety, and security, especially when aspects of strategic national importance are implicated. Examples include deaths on the railway, accidents on ships at sea, and deaths involving civil and military aircraft.

Inquest and Cause of Death

A coroner's jury usually has a number of predefined decisions that they can make, which are termed *rulings*. There are five main causes of death categories: (1) death by misadventure, (2) accidental, (3) natural, (4) suspicious death, and (5) so little evidence exists that the cause of death remains undetermined. Some jurisdictions have rulings that are more specific, including, for example, death by attempted or self-induced abortion and death as a result of another's self-defense.

An inquest with a coroner's jury is similar to a Grand Jury, which is like a pretrial that is held to determine if a court case should be initiated. Consequently, a coroner can recommend a named individual be mandated to trial. While such a recommendation may not be legally binding, it would be unusual for the rest of the legal system to ignore the rulings that emerge from an inquest.

The criminal trial—with a judge, prosecution, defense, and jury—is the archetypal legal process for making rulings in much of the West and because of this, coroners are often seen as holding too much power. Even if a coroner cannot commit someone to prison, his or her role in determining the manner of death is important for the family and friends of the deceased, and this can have implications for the payment of life insurance as well. In cases of death that are of public interest, the decision of the coroner can affect how public institutions respond to that death and their ability to prevent similar incidents in the future. A coroner's jury can provide an additional element of legitimacy to the legal process of the inquest. Nevertheless, juries are not without problems because they are often viewed as increasing the cost of the legal process. Some analysts also suggest that juries are often unable to adequately comprehend complex cases. Consequently, coroner's juries are likely to remain a viable entity, but only for those cases that are likely to receive a considerable amount of public attention.

Cosmetic Restoration

Cosmetic restoration is the treatment and preparation of the dead body prior to its disposition. Today cosmetic restoration is a series of sophisticated procedures that utilizes technology, prosthetics, and makeup. Taking place at the same time as embalming, cosmetic restoration is usually concentrated around the most visible areas of the body, such as the face, throat, and hands. It is widely considered to be a significant part of the funerary ritual process, and it is related to analyses of the denial of death.

Cosmetic restoration is the practice(s) of making the body appear lifelike and natural; some would even go so far as to say making it look alive. It is typically undertaken when a body is to be viewed by bereaved survivors. Restoration normally involves facial and bodily reconstruction, the application of cosmetics, and dressing of the body. The actual activities that surround preparing the body after death are culturally specific, including when the activities are performed and by whom.

Currently, cosmetic restoration is most popular in North America and is undertaken by a mortician once the body is in the possession of a funeral director. Overall, Christians neither overtly support nor object to it, whereas Orthodox Jewish and Muslim religions consider it a desecration of the dead body and therefore prohibit it. One of the motivating factors for cosmetic restoration to be undertaken is due to the physical, bodily changes that take place once a person has died. In places and religions where it is customary to cremate the body, such as Sikh and Hindu communities, or where it is not usual to view the body, there is little need for the body to be restored, and therefore it is not common practice. In the United Kingdom, for example, where cremation accounts for over two thirds of all dispositions, and the deceased is not typically available for public viewing before or during the funeral, it is unusual for the body to be cosmetically restored. In the United States, where public viewings of the deceased are much more popular, it is much more common to attend to the body in some way. Thus, the act of cosmetic restoration needs to be understood as intricately associated with cultural customs surrounding the handling and public display of the body after death.

The process of restoring the body is often promoted and marketed as the option to create a lasting and lifelike "memory picture" of the deceased. This lifelike impression has strong associations with postmortem photography, which was particularly popular in the late 18th and early 19th centuries, whereby the dead body was arranged to appear as if asleep.

The actual process of cosmetic restoration is unique to the deceased person and the manner of his or her death. Once a person has died and the heart has stopped pumping blood to organs, gravity causes the blood to sink to the lowest part of the body. For example, if the body is face up then blood collects in the back and buttocks. This is accompanied by a loss of muscle tone, the result of which is discoloring, and parts of the body beginning to sag, with eyes in particular prone to sinking into the skull. These early stages of putrefaction can be extremely distressing for the recently bereaved to witness, and this is one of the main reasons why funeral directors suggest cosmetic restoration prior to a viewing.

Once a body has been released for disposal and the next of kin have specified their wish for the body to be prepared for viewing, it is cleansed. After washing, the first major task involves "setting the features," an expression that refers to the arrangement of the facial expression. Morticians normally ask for a recent photograph of the deceased person, preferably in good health, to try to mimic their natural living appearance as closely as possible.

There are several components to setting the features, which depend on the age and gender of the deceased and the cause of death. In the initial stages, it may involve massaging the face and parts of the body to break down rigor mortis in the muscles. If the deceased had been involved in an accident or had had surgery, including a postmortem,

it may also be necessary to undertake some element of bodily reconstruction. Wax, plaster of paris, and adhesive can be used to reconstruct parts of the body, with prosthetics widely available to rebuild features such as the nose, lips, eyes, ears, and limbs. If limbs were severed and still obtainable, they can be sewn back on, including the head. If not, clothing can be used to disguise missing body parts.

After this, children's and babies' faces are routinely covered in massage cream to give them a "dewy" glow; for older people, rough skin is sandpapered to present a smoother, unblemished complexion. On all bodies, the throat and cheeks are packed with cotton to prevent leakage and appear fuller. In adults, lips are stitched, wired or glued together to prevent gravity from pulling the mouth open. For children, the mouth is usually positioned to be slightly ajar, a look considered to be more natural for younger people. Eye caps are inserted to keep eyeballs in the correct position and the eyelids shut. This has been interpreted as a contemporary form of keeping the eyelids shut using pennies (which, as Christine Quigley has stated, is contrary to the popular belief that pennies were primarily used for payment in the afterlife). Hair is washed, cut and styled, and false hair and wigs are used in cases where the deceased had lost their hair, for example, through treatment for cancer. Facial hair is plucked and trimmed, and men are shaved. Moisturizer or massage cream is then applied to stop skin from drying out. Orifices such as the ears and nose are packed with cotton to prevent any seepage.

After setting the face, cosmetics are applied. Different shades of makeup are used to add depth and warmth, so it is common for red and pink makeup to be used in areas where blood would normally be found close to the surface of the face (such as in the cheeks and lips). Brown hues are added around the eyes to make these areas of thinner skin appear more luminous and lifelike. Eyes are then finished with eyeliner and mascara if necessary. Often applied using an airbrush, bleach or very thick makeup, similar to the consistency of face-paint, can be applied to minimize or hide bruises, cuts, and discoloring. This is particularly important if the deceased died as the result of head injuries or had a postmortem that involved incisions to the face, throat, or skull. Fingernails are cut and painted and fingers glued together if required. The deceased is then dressed in (preferably his or her own) clothes and jewelry and transferred to the coffin. The hands and head of the deceased are positioned to create a natural appearance, reminiscent of a sleeping posture.

The purpose of cosmetic restoration is to be invisible. That is, the aim is to create such a convincing, natural appearance that bereaved visitors would not be immediately aware that the body had been attended to, or even that the person had died. Problems with cosmetic restoration can arise because the person who tends to the body did not know the deceased prior to his or her death and therefore structures the facial features or applies makeup in unfamiliar ways. Seeing the deceased looking "unnatural"—that is, not how they looked when alive—may be deeply upsetting for bereaved people and is therefore something that funeral directors are keen to avoid.

In an effort to prevent this, funeral directors must assure clients of their ability to tend to the body of the deceased and must adhere to particular standards of bodily preparation. It is becoming increasingly common for those involved in cosmetic restoration of the dead body to undertake formal training and qualifications. In the United States, for example, this can be done through the various mortuary science programs offered by the National Funeral Directors Association. As a part of the overall professionalization of the funeral industry, cosmetic restoration is also increasingly governed by professional codes of practice. In the United States one of these is the National Funeral Directors Association's Code of Professional Conduct; in the United Kingdom it is the National Association of Funeral Directors' Code of Practice. These codes, however, are voluntary rather than obligatory agreements and are made on a case-by-case basis between the member organization and the funeral directing firm.

Critics of the cosmetic restoration of the dead body have argued that these practices transform the deceased's body into an object and commodity that "solves" the process of bodily decomposition. The process of decay, they argue, symbolizes a threat to the loss of the self and is a reminder of our mortal condition. As a result, it is something that must be concealed. For critics, cosmetic restoration not only encourages unrealistic expectations of the appearance of a dead body, it also contributes

to an overall societal denial of death. By restoring the dead body, cosmetology can therefore be seen as a barrier to accepting the physical, and embodied, reality of death.

Now an enormous industry, cosmetic restoration has also been criticized for offering a very lucrative source of income for those involved in the trade, and consequently may not always be offered and undertaken in the absolute best interests of the bereaved. There is further concern that bereaved people are vulnerable, and therefore susceptible, to being encouraged to spend a lot of money after the death of a loved one, and that cosmetic restoration is subsequently another possible source of exploitation.

In contrast, supporters of cosmetic restoration of the dead body have argued that instead of seeing restoration as being about a denial of death, rather it could be seen as part of the process of confirming the death of an individual, and as a ritual starting point for the deceased in their transition to their new identity of "the dead." Proponents of cosmetic restoration have also argued that it may assist the bereaved in coming to terms with their loss, by enabling them to view the natural-looking lifelike body and have a lasting image of the deceased. These two ways of interpreting cosmetic restoration—on the one hand, going to lengths to avoid the physical outcome of death and decay, and, on the other hand, offering the bereaved a comforting lasting image of the deceased—creates something of a tension. The task of funeral directors and those who work in the aftercare industry is to recognize and accommodate these two potentially conflicting perceptions and expectations of cosmetic restoration. As the demand for cosmetic restoration in the 21st century shows no sign of abating, the challenge for the future will be to provide restoration services that bereaved people request and desire, but to do so in the way that does not cause upset or exploitation.

Cremation

Cremation is the process of burning the human corpse until only some bone fragments and ashes remain, material often described in American English by the neologism *cremains*. Cremation possesses two trajectories within human cultures, one that is long-standing and of ancient origin and the other of modern invention. The former is reflected in archaeological findings from the New Stone Age of some 8,000 years ago in China and 6,000 years ago in Britain as well as in ancient Greece where they pass into Bronze Age and Iron Age practice only to be replaced by burial by about the 5th century B.C.E. Ancient customs of cremation on the Indian subcontinent are still familiar in Hinduism, Buddhism, and Sikhism, which retain cremation as their main funerary rite of human disposal. The modern invention of cremation, by contrast, began in the later 19th century in Europe as a result of scientific modernization aimed at social welfare on the one hand and ideological opposition to traditional Christianity on the other. Although this entry focuses on the modern resurgence of cremation, it also sketches aspects of these ancient traditions to stress that cremation serves as a vehicle for a variety of political, economic, and social values as well as specifically ideological or religious beliefs.

Early in the 20th century the French anthropologist Robert Hertz made the important point that cremation itself is seldom a single rite of burning the corpse but often involves a secondary

process dealing with the ashes as part of the reorganization of a society after someone's death. The dead person is often given a new identity, perhaps as ancestor, while the living come to terms with their own bereavement. The ashes may be buried, placed in running water, or even ingested.

Ancient Continuities

Underlying the ancient roots of cremation in India is the idea of cremation both as a kind of sacrifice to the gods and as a vehicle by which the lifeforce or spirit is released from the body that it has vitalized during its lifetime. In traditional Hinduism, Buddhism, and Sikhism, that spirit is believed to have a life of its own in the ongoing round of existence or *samsara* by which it comes to inhabit a series of life forms prior to human birth and after bodily death. The notion of *karma* controls this ongoing passage of the lifeforce in terms of a scheme of cause and effect grounded in a moral code of right behavior. Life lived according to religious-social laws that are grounded in the human affinity for reciprocity conduces to an accumulation of positive moral power or merit and will lead to a better future existence, whereas a negative valuation has the opposite effect.

This ideology links birth and death and makes sense of cremation as part of a wider processing of the self in India-derived religious schemes, including the sense of cremation as a final gift made to the gods, the last act of devotion in this present existence. The traditional Indian cremation pyre could, therefore, be seen as a form of altar of fire sacrifice. The equally traditional custom of the eldest son cracking the deceased parent's skull during the process of cremation, similarly, sets free the lifeforce for its transmigration prior to future embodiment.

Banaras, often called Varanasi, is a distinctively holy city whose symbolic place in Indian thought includes the view that to die and be cremated there is to end the cycle of reincarnation. To have one's ashes placed in the River Ganges is, also, a highly desired goal and exemplifies Hertz's argument of the double nature of cremation processes. The Christian world had no such ideology of samsara and karma by means of which to interpret cremation, its own basis for understanding death rites being dependent upon burial in imitation of the death and burial of Jesus Christ and in hope of a resurrection rooted in the belief in his resurrection from the dead.

Modern Cremation

In Europe, cremation had been common in much of the western Roman Empire for several centuries before the Christian Era, but this changed during the 2nd century for a variety of reasons, including the fact that the Emperor Constantine (274–337 C.E.), Christian convert that he was, forbade cremation. This led to a millennium and a half era of burial tradition throughout expanding Christendom.

Although some interest in cremation was shown in France in the 17th century, little came of it and it was not until after the 1850s that the topic began to be widely debated. Such innovation met with a variety of responses from Christian churches that had, very largely, come to assume a dominant role in funeral provision of burial. The Eastern Orthodox tradition remained staunchly opposed into the 21st century on the basis that Christ had been buried and resurrected and was the model for all Christian believers.

Most Protestant churches came to accept cremation, but this was not the case with the Roman Catholic Church. In the 1886 Declaration *De Humana Corpora Cremandi*—pertaining to the cremation of human bodies—the Church opposed anticlerical and secular groups, especially the Freemasons. The Church specifically disapproved of societies that promoted the practice of cremation of human bodies. This position was further reinforced by a Canon Law of 1917 that removed the right of a church funeral to those who chose cremation. Given the importance of Catholicism in Italy this was one reason why, despite some Italians being innovators and leaders in cremation ideology, it did not become a widely practiced form of funeral.

It was not until the 1963–1964 statement *De Cadaverum Cremationе*—concerning the cremation of corpses—and a new church law of 1983 that the Catholic Church allowed for cremation of its faithful members. Nevertheless it took a considerable period for established burial custom and opposition to cremation to decline in traditional Catholic countries in contrast with traditional Protestant countries where relatively little sustained opposition to cremation occurred.

This difference is evident in the data presented in Table 1. These data represent the period shortly after the change of outlook of the Catholic Church. Percentages are also included for the United States

as well to reveal a distinctive yet complex profile that reflects both the Catholic inheritance and the Jewish influence that tended against cremation, and because the data hint at the extensive rural nature of many American towns where burial grounds were well established as community identity points and where land was far less a problem than in many highly populated cities.

Cremation can be taken as an index of traditional Catholic and Protestant cultural histories as well as one potential marker of secularization. Early 21st-century Europe has witnessed a relatively rapid rise in cremation rates in otherwise traditional Catholic countries at a time when strict adherence to Church rule and doctrine has declined. By 2005 the cremation rate in Spain was 19%, France 25%, and Portugal 36%. In the United States it was approximately 32%.

National Differences

The Western country that came to lead the field in modern cremation was Great Britain, especially England and Wales, fostered by The Cremation Society of Great Britain. The statistics shown in Table 2 indicate the development of cremation in Britain from the time that cremation numbers can be taken as a percentage of all deaths. The small numbers recorded during the late 19th century represented higher levels of the socioeconomic profile of Britain, whereas as the 20th century progressed, this funeral form became more widely democratized with 1968 being the year when cremation became the dominant mode across the whole of the United Kingdom. Once cremation reached approximately 70% to 72%, it leveled out, leaving approximately one quarter to one third of the population indicating a preference for burial.

Ashes

Modern cremation takes from 1 to 2 hours to reduce a human corpse to ash and bone fragments. The coffined body is usually placed in a cremation chamber preheated by gas, electricity, or oil. The coffin burns and then the body becomes dehydrated and contributes to its own combustion as its fat and other components ignite in temperatures of around 700 °C to 850 °C. Modern techniques control the rise and fall of temperatures to maintain optimum burning conditions and, in many contexts, to reduce the level of visible dark smoke coming from crematoria chimneys. Increasingly, much effort is made to include filters that may also control or reduce the output of noxious gases.

After cremation the remains are raked from the oven itself, often with considerable care to keep one person's remains distinct from the preceding cremation. These are often then placed in a machine called a *cremulator* that grinds them, especially bone fragments, into a more uniform consistency, before placing them in some appropriate container to return to the relatives. Ashes are convenient for transporting the dead as today in parts of America

and Europe when, for example, people move away in retirement but are returned to their family hometown after death and cremation.

The final location of ashes differs widely. Ancient societies often placed them in urns in graves. Traditional Indian custom prefers running water as part of its wider ideology of the cycle of human elements. Some eminent Buddhist remains are located in stupas, which become a focus of reverence. Modern Christian cultures preferred the burial of remains to retain the idiom of traditional Christian burial as symbolic of the burial of Christ in anticipation of the resurrection. Some have encouraged the use of columbaria with niche walls for ash urns or lawns and other gardens of remembrance. Sometimes this act is ritualized, but often it is a utilitarian event. Rare innovations include an ash fountain in Budapest where, in a lawned environment, an electrically driven device spins and scatters remains into upward-shooting water fountains in an aesthetically attractive fashion. From the later 20th century, British families increasingly placed ashes in sites of personal significance, often echoing aspects of the deceased's life. Groups in the 21st century have made it possible to have ashes distributed through fireworks, sent into space, or even built into a kind of coral reef.

Crematorium

Modern cremation has been contained within buildings whose design expresses symbolic aspects of life, death, and destiny. The crematorium is one of the few innovative structures of the late 19th and 20th centuries. Because churches and graveyards had long been associated with funerals, crematorium design initially took an ecclesial form; later developments sought novel schemes to express the depth of human life and grief while also affording a sense of hope and life's value. The oven itself has regularly been set within the work area of a utilitarian type quite separate from the main hall where the funeral ceremony occurs. A major design involves the actual movement of the coffin from that public ritual space into the more private zone of technical disposal. That zone is often divided between a more aesthetically symbolic "charging area," where the coffin enters the oven, and a work-like area at the other end, where the ashes are removed, ground up, and passed on into some more formal office or bureaucratic domain. This plan involves a kind of distinction into more and less "sacred" spaces.

'The one design feature that has often occasioned critical comment is the way the coffin is removed from the main ceremonies hall or chapel into the charging zone. This marks the moment when, for the great majority of modern cremation rites, the relatives and friends have their final contact with the coffined body. Some crematoria adopted a descending mechanism so that the moment of parting is highly reminiscent of burial. In these cases the cremators are often also at a lower level. Others employ curtains that are drawn between the coffin and the funeral party with the coffin removed after people leave the hall; yet others, albeit a very small proportion, have used a kind of conveyor belt or a roller system by which the coffin may be transported through a hole in the wall. Finally, some let the coffin remain visible while the people physically leave the hall. There are advantages and disadvantages to all of these methods. One common criticism has referred to the sense of being "processed" or to the impersonal nature of cremation rites. This is understandable when the established culture of a society has involved burial, which is more labor intensive and directly in touch with earthy elements. Some crematoria have been designed so that people enter and leave the main hall by different doors, thereby easily giving the sense of being processed or managed in contrast with many traditional sacred spaces that are, normatively, entered and left by the same route. In some societies the actual crematorium building is extremely functional and not used as a place for ceremony; instead the rites occur in an actual church or funeral home with the coffin being sent for cremation as a separate and pragmatic event.

The design of crematoria also raises the issue of religious or nonreligious symbolism. Some of the Freemasonic cremation "temples" in Italy, as at Turin for example, bear the architectural features of classical antiquity, including Egyptian pyramid-like elements, rather than any Christian marks. Such explicitly non- or anti-Christian features, along with the rites conducted in them, were a sure challenge to established Christian orthodoxy whose identity is often manifest through church buildings

and their associated rites. As the 20th century progressed, a divergence occurred between crematoria that were built to resemble or which were developed from cemetery chapels, with all the appropriate use of religious symbolism such as crosses and stained glass windows, and those that struck a nonreligious note that made the building usable by people from any or no religious tradition. Rarely, as at the very large crematorium at Seoul in Korea, different ceremonies rooms are provided for different religious and cultural traditions. In many late-20th-century crematoria, movable symbols enable a wide variety of groups to have a symbolic environment appropriate to themselves. Much attention is frequently given to the landscape and gardens surrounding crematoria to capitalize on the power of vegetation and running water to frame the emotional lives of those attending them.

The transient nature of cremation has led to various forms of memorialization of the dead at crematoria, whether in inscriptions, plaques, or in a formal Book of Remembrance held in a special room. All of these allow people to revisit a crematorium and engage in some memorial activity focused on some representation of the departed person. Some of these books are costly and echo established forms of book-binding and calligraphy. With the advent of the Internet, many companies and cremation authorities have also provided online forms of memorial.

Legalities

One of the most frequent objections raised against cremation in its earliest decades was the worry that it would hide murder, making it impossible to gain forensic evidence from a cremated body, unlike the situation where a buried body might be exhumed. To counter this issue, cremation associations, societies, and managers of premises sought legal safeguard through the implementation of appropriate medical certification of the death.

Cremation's Negative Image

Cremation has been used as a means of disposing of the dead in circumstances of war and pestilence. Some ancient Greek sources tell of cremating the large number of people killed in battles or when individuals have died far from home. One 20th-century example is that of epidemic deaths having many corpses treated by emergency cremation. The use of cremation in the Nazi Holocaust, as also in the burning of those denounced as heretics in several traditions, has imparted a radically negative value to fire in relation to human death. This echoed the image of fire as the punishing element of hell in some traditional Christian ideas of the afterlife.

Pets and Objects

It is not only people who are cremated. While the mass incineration of animals has been well-known in cases of disease, from the later decades of the 20th century it also became possible to have pets cremated at specially designated pet crematoria in various Western societies. The city of Tokyo, Japan, even accommodates a traveling crematorium to visit a family's home to deal with their dead pet. In this, the honorary-human status accorded to some pets becomes particularly obvious. Japanese custom also has a provision for the burning of domestic objects, not least, chopsticks, when at the end of their useful life. This reminder of how humans treat valued objects in highly symbolic ways brings them into a wider grammar of discourse of dead bodies.

Cremation Movements

The emergence of modern cremation in the 19th century, and its flourishing in the 20th, heralded a distinctive element of social change in industrial societies. This change did not occur by accident or by any gradual shift from preexisting burial traditions, but through the campaigning of special voluntary interest groups, which possessed a variety of motivations toward social reform. The shift to cremation was strongly advocated or imposed by political agencies of state. This entry differentiates between these two categories of voluntary association and ideological fraternity on the one hand, and political agencies on the other, before concluding with an account of national and global organizations and the effect of their publications on the development of cremation.

Types of Movement

Voluntary associations typify what first comes to mind as cremation movements: groups established to promote the modern practice of burning the human corpse until ash and bone fragments remain. They have, probably, been the least known, yet ultimately, the most significant influencers of cremation practice. They came into being specifically to promote cremation through debate, conferences, journals, and political lobbying for funeral law reform. Many countries have had or still possess such cremation societies and associations.

By contrast, the ideological fraternity aspect of this type refers to Freemasonry, especially in Italy in the later 19th century, when its more general ideological-philosophical policies focused on cremation as part of an anticlerical movement. Outside this context many Masons were Christian and not hostile to religion, unlike many in the dynamic political world of mid- and late 19th-century Italy. There, Masons triggered a powerful ecclesiastical response from the Roman Catholic Church, which opposed cremation for nearly a century.

The second type of cremation movement accounts for large-scale political institutions of state, typified by China, Japan, the former USSR, and the short-lived Nazi regime of the Third Reich. Each, for quite different reasons, either encouraged or enforced cremation.

Voluntary Associations

Voluntary associations have been the most influential of all cremation movements because they identified underlying needs of particular groups in society that became increasingly appreciated and widely accepted by others. Such associations have depended for their birth upon the far-sightedness of individuals who gathered around themselves like-minded people capable of creating intelligible and persuasive programs of activity. This mix of allies has often involved both charismatic and bureaucratically informed individuals possessing extensive social and cultural influence derived from their ordinary professional, commercial, and cultural lives. In the 19th century this typically involved medical and other scientific workers, allied with social and welfare reformers, as well as literary, artistic, or philosophical thinkers. The following selected individuals, and the groups they patronized, could be much expanded for many countries.

Ferdinando Coletti (1819–1881) was an influential Italian academic, professor at Padua's ancient university, medical scientist, and regional politician; he argued the case for modern cremation as a replacement for burial from as early as 1857. Indeed Italy—whose integrated Kingdom was founded in 1861—became a focus for much cremation debate and practical activity, especially in the 1870s. The first western cremation temple was built in Milan to cremate the industrialist Alberto Keller in 1876. The same year also saw the United States gaining its initial cremation facility. Many cremation societies were established across the world from the 1870s, including those of Great Britain and Holland in 1874, Milan in 1875, France 1880, Denmark 1881, Turin 1883, and Vienna 1885. Medical doctors, scientists, and

literary and philosophically minded individuals often spearheaded these societies and pressed for the legalization of cremation in their respective countries, as well as arguing for the building of crematorium facilities. In Australia, for example, Dr. James Neild, an academic doctor in Melbourne, presented a paper titled "On the Advantages of Burning the Dead" to the Royal Society of Victoria in 1873.

The desire for funeral reform was often prompted by the desire for improved social hygiene and welfare provisions in towns and cities that had grown dramatically as a result of industrialization. Sometimes cremation became a cause and focal point for workers' groups as in Austria's Labor Cremation Society Die Flamme, which was formed in 1904 and had a social-democratic outlook and opposed the Catholic Church's position.

Ideologies: Freemasons, Catholics, and Theosophists

Freemasonry, which in Catholic countries often took an anticlerical and secular standpoint, was particularly influential upon the growth of cremation in Italy and some other European countries. To have a secular ideology is one thing, but to engage in a clearly secular ritual in newly architected and deeply symbolic buildings is another, and that is just what happened in many of the later 19th-century Italian "cremation temples" such as that of Rome, built in 1883, or Turin in 1888. In 1874, a key Italian Freemasonic group undertook to promote cremation throughout the newly united country, led by the medical doctor Gaetano Pini (1846–1887), who had also fought alongside Garibaldi. Pini's perspective was one of secular reform, hygiene, and social welfare. His leadership, and the zeal of many other Italian leaders, meant that by 1886 there were some 36 active cremation associations and 14 operating crematoria in Italy. The Catholic response essentially banned cremation for Catholics from 1886 until 1964. The influence of Masonry and the Italian background is also evident in the pioneering cremation work of José Penna, who organized the first cremation in Argentina in 1884. The person involved had died of yellow fever; indeed, Penna had the issue of contagious diseases and epidemics as a long-term medical commitment. This example shows the complexity of motivation over cremation given Penna's medical-social concerns.

Other groups encouraging cremation included Theosophy, established in 1875 in New York by Madam Blavatsky and Colonel H. S. Olcott. It sought to integrate what it believed to be ancient teachings of divine wisdom with the new discoveries of evolution. With deep interests in India—it moved its headquarters to Bombay in 1907—it is not surprising that some Theosophists found the new cremation debates and the possibility of practicing cremation appealing. Theosophical groups, both in the United States and in Australia, were influential advocates of cremation. In 1876 it was Olcott who organized the funeral ceremony for the Freemason Baron de Palm with a ceremony held at a New York Masonic Hall followed by cremation at the medical doctor Julius LeMoyne's cremation facility. This first modern American cremation classically integrates medical-scientific motives with Freemasonic and Theosophist ideals.

National Societies

In Great Britain, the Cremation Society was founded in 1874 by Sir Henry Thompson, who had been influenced by a visit to Vienna's World Fair in 1873 where he saw Coletti's model cremator. Thompson, himself surgeon to Queen Victoria, gathered a group of like-minded friends together in London, and in January 1874 they made a declaration aimed at replacing burial by some appropriate means of reducing the body to its constituent elements by some means "innocuous" to the living. For the time being they considered cremation to be the most appropriate alternative.

The Cremation Society of Great Britain that followed that declaration had a colorful history, building its first crematorium at Woking, where the first cremation took place in 1885. This was before cremation had actually been given formal legislation by any act of Parliament, which did not take place in Britain until 1902. In 1884, however, a most unusual event in Wales had led to a judicial decision that cremation was not unlawful as long as its performance did not disturb the public peace. This decision by James Fitzjames Stephen, a man of wide knowledge and experience, including a period in India, was occasioned by the act of one William Price who, at the age of 84, decided to

cremate an infant son whom he had named *Iesu Grist,* the Welsh for Jesus Christ. The burning had been stopped during public protest, and Price was arrested. Judge Stephen's ruling on this case involved a long analysis of the history of cremation in antiquity, and his basic analysis hung on the idea that cremation accomplished rapidly just what burial did more slowly, namely, the dissolution of the corpse. He was not troubled by any Christian theological concern over burial and resurrection, an issue that many other contemporaries might have advanced as an objection to cremation. Among those who had influenced this judge was Sir Henry Maine, the Master of Trinity Hall in Cambridge. His particular case illustrates the way in which cremation in one particular country emerged as a result of a number of determined and influential characters who adopted ideas from other European contexts and sought to render them practical in their own society. It shows how innovation encountered opposition but also benefited from the serendipity of idiosyncratic events and persons.

In the United States the figure of Francis Julius Lemoyne of Washington, Pennsylvania (1798–1879), dominates the emergence of modern cremation. He was medically trained but also much involved in political activity and social reform, including antislavery activity. He built a cremator on his own property in 1876 and experimented with the cremation of a sheep. Many involved in the cremation movement in the United States were drawn from the medical world, social welfare, and sanitation, often including individuals with more open religious views derived from such groups as the Unitarians, Universalists, Episcopalians, or the Theosophists. This early phase of ideologically driven cremation movements, also inspired by another powerful figure, Michigan doctor Hugo Erichsen, then seemed to pass into a more business-oriented commercializing of cremation in the United States.

In Malaya the emergence of modern cremation was influenced by Wu Lien-Teh, a Cambridge-educated doctor whose interest had been galvanized in China when he had been chief medical officer of the Manchurian city of Harbin, where over 2,000 people had died from pneumonic plague in 1911. Only after special permission was received from the Emperor of China were the corpses burned in mass outdoor piles. Since that time many contemporary societies have also had to plan for mass cremation in anticipation of military warfare and catastrophic levels of death.

Political Movements

Japan possesses a complex funerary history involving ideological preferences allied with different views of Buddhist preference among elite and popular groups. From a long tradition of burial, through intense debates from the 17th to the 20th century, Japan came to near-universally adopt the practice of cremation by the late 20th century. China also experienced shifts from traditional forms of burial to cremation and back to burial all before the 17th century. It fell to the People's Republic of China in 1956 to establish a formal proposal for cremation to save land and excessive funerary expenses. The espousal of cremation by Communist Party officials has been described as among the first of the revolutionary social transformations. When the country's premier, Zhou Enlai, died in 1976, he was cremated and his remains were scattered throughout the land. Many new crematoria, laws, and qualifications for operatives ensued. In China, by 2002, just over half of those who died were cremated.

Though cremation had been discussed in Russia in the 1880s, it was not until after the 1917 Russian Revolution that the state legalized cremation in 1918, in the face of strong opposition by the Russian Orthodox Church. In 1927, a formal state Society for the Dissemination of the Idea of Cremation was established, but cremation did not gain much popular acceptance, and only then in the cities, in the 1980s after large-scale urbanization had taken place. Despite the demise of the USSR and the resurgence of Orthodoxy, cremation remained a viable economic option for poorer people even if the new rich preferred burial.

Perhaps the best-known formal "state" program of cremation was that of the Nazi Third Reich. In 1934 regional legislative variations were overridden when cremation and burial were made equal in law. Previously some German regions had relatively high cremation rates in Protestant areas. Then, during World War II, cremating ovens were developed for use in concentration camps and were used to burn vast numbers of corpses. This

"corpse incineration" has sometimes been differentiated from cremation because of its radical utilitarian and inhuman nature; it reduced the popularity of ordinary cremation in Germany after the war.

These examples highlight the symbolic role of fire, enhancing its preexisting mythological-theological role in images of hell and afterlife punishment and revealing one aspect of negative public opinion that cremation societies and the cremation movement had to overcome in their campaigns to win over legislators and public opinion.

Global Aspects: Conventions, Conferences, and Journals

Engagement with popular opinion and the established views of legislators and ecclesiastical authorities had been the major task of individuals forming and leading cremation movements in the 19th century. That century had, however, witnessed remarkable developments both in innovation and international industrial trade and commerce, often aligned with an increased sense of national identity. Gatherings, such as the International Technological (World) Exposition held in 1867 in Paris or Vienna's World Fair of 1873, as well as medical conferences often raised issues over lifestyles as well as matters of medical hygiene, social welfare, and town planning. This increasingly global ethos facilitated international gatherings of existing cremation societies and of people wishing to establish them, for example, in Brussels (1910), Dresden (1911), and Prague (1936). An American gathering in 1913 also heralded a new Cremation Society of America that, as it happened, was supported more by funeral professionals than by social reformers as such. The Prague event, however, proposed a major gathering for London in 1937, the outcome of which was the establishment of an International Cremation Federation. By the following year no fewer than 18 countries were financially supporting this federation, whose development was much hindered by World War II. It resurged, however, and at the outset of the 21st century, it provides a major global forum for encouraging national societies and for developing knowledge of technical and ethical aspects of cremation, not least through periodic conferences. Some national societies also hold their own conferences, with the Cremation Society of Great Britain's annual event being particularly popular with international delegates. It also publishes the highly informative journal *Pharos International*, which began publication in 1934. One earlier example of publication was that of the Austrian Cremation Society whose journal, appropriately titled *Phoenix*, dates from 1887. During the 19th century, in the intellectually intense years of debating cremation across the world, certain key books and articles catalyzed and informed people. Sir Henry Thompson's 1874 essay "The Treatment of the Body After Death," in the January edition of the United Kingdom's *The Contemporary Review*, was matched by Dr. Hugo Erichsen's *Cremation of the Dead* in 1887 in the United States. One early consideration of cremation was that of Sir Thomas Brown in his 1658 study of urn burial titled *Hydriotaphia*.

Cryonics

Cryonics is a technique whereby human or animal remains are preserved and stored at very low temperatures in the hope that future technological advances will allow resuscitation. Proponents of cryonics believe that if a person is preserved quickly enough following a pronouncement of legal death, the body's cells, especially those in the brain, may be revived with the help of future medical and scientific advances. Because of the belief that the cryopreserved may one day be revived, supporters do not consider people "absolutely dead" unless there is irreversible brain damage that would negate any hope for a future independent life. Rather, supporters argue that the clinically dead—traditionally defined as those without a heartbeat—are revived all the time thanks to cardiopulmonary resuscitation and thus there is reason to believe that, in time and with proper preservation techniques, all clinically dead people may indeed be cured. Based on the premise that cryonics may have the ability to save basic brain information, including memory and identity, proponents do not refer to the cryopreserved as deceased but rather as patients.

History of Cryonics

In 1962 Robert Ettiger first began thinking about cryonics as a preservation technique. As a physics professor in Michigan, Ettiger proposed that currently fatal diseases may not be as threatening in the distant future, as technology and medicine continue to improve, and that freezing a recently diseased person may allow for future resuscitation. His 1964 book *The Prospect of Immortality* is often considered the foundational text for many cryonicists although at roughly the same time, Evan Cooper founded the Life Extension Society, the first cryonics organization in the world. By 1965 Ettiger began the Cryonics Institute, located in Clinton Township, Michigan, which was the first organization to successfully cryopreserve a human, Dr. James Bedford, a 73-year-old professor. Dr. Bedford still remains suspended in liquid nitrogen, although cryonicists currently use much more sophisticated preservation techniques. At the time of printing, the Cryonics Institute holds 87 patients, more patients than any other cryonics institution. Other cryonics facilities in America include Alcor Life Extension Foundation (1972) in Scottsdale, Arizona, and Suspended Animation (2002) in Boynton Beach, Florida. A Russian organization, KrioRus, maintains a small facility with four patients, and Australia is currently planning on opening a facility in the near future. Support groups currently exist in Europe, Canada, and the United Kingdom but do not yet offer services.

The Cryonics Ideology

Cryonics has tremendous faith in the possibilities of science and technology to not only allow cryonically preserved patients to resume life but also to find cures for fatal diseases and illnesses, including cancer and AIDS, and perhaps even to find ways of reversing these conditions. Thus, in the distant future, scientific advancements may make it possible to eliminate the cryopreserveds' fatal disease and to repair those cells damaged in its destructive wake. No human or other mammal has been successfully cryopreserved and revived to date, although proponents point to successful preservation and revival of certain insects, human embryos, and small mammalian organs as evidence that human revival may one day be feasible, especially as molecular biology and nanotechnology continue to make advancements in cellular repair.

Cryopreservation

Cryopreservation requires that a body be cooled to –321°F, which is the boiling point of liquid

nitrogen. Oftentimes cryonics is equated with freezing, but this is not technically correct because freezing cells leads to mechanical and chemical damage. To prevent cellular freezing, chemicals are injected into the body that act as anti-freeze agents. These chemicals, called cryoprotectants, are necessary for vitrification, the process where a body is cooled and solidified without freezing. Vitrification was developed in the late 1990s by cryobiologists Gregory Fahy and Brian Wowk in an effort to preserve transplantable organs for those in need of new organs. Although vitrification prevents freezing to a large extent, it remains unknown how the toxicity of the cryoprotectants will affect patients' chances of revival in the future. However, cryonicists argue that the potential damage caused by the chemicals would be less severe and problematic than the damage caused by cellular freezing.

To limit the cellular damage that inevitably results upon legal death (i.e., when blood is no longer circulating to and from the heart), cynonicists suggest that ischemic injury, or the loss of oxygen to bodily tissues, can be controlled by "standing by" at a clinical death. Cryonics can only legally be performed on the clinically deceased, but this does not mean that all bodily cells have died. "Standing by" involves a cryonicist being at the bedside of a patient. Once the patient is pronounced legally dead, the technician would then perform CPR (cardiopulmonary resuscitation) in an effort to get blood circulating, albeit artificially, to maintain cellular life right up until the vitrification process begins. "Standing by" attempts to control ischemia injury, especially to the brain cells, which begins immediately after the heart ceases to beat. The logic is brain damage will be kept at a minimum, thus increasing the chances of a possible revival in the future.

Both scientists and cryonics advocates agree that revival is not achievable in the near future. For this to occur technology must be advanced enough to allow for bioengineering and nanotechnology to repair tissues and organs that did not properly vitrify and also to reverse the disease that led to the patient's death. This corrective process at the cellular level most likely would have to be completed prior to the body being warmed. Revival precludes people who suffered brain damage either before or after clinical death because cryonicists argue that the brain is not only the center for all other organ function but, more importantly, the site of identity and memory. Because brain information is so crucial to a cryopreserved person's chances of revival, the likelihood of remembering the past upon warming is the threshold for determining *legal death* (chance of revival if technology develops) and *absolute death* (no chance of revival either because the person was not cryonically preserved or brain damage is too severe to sustain independent life even in light of revival technology).

Contemporary Techniques

Currently, there are two techniques for cryonically preserving human bodies. The first method involves vitrification of the entire body and then suspending the remains in a chamber filled with liquid nitrogen for storage until revival becomes a scientific possibility, perhaps centuries into the future. The other technique is newer and remains somewhat more controversial.

Neurocryopreservation, or sometimes referred to simply as "neuro," is the vitrification and storage of only the client's head. Supporters of this method stress that only the information in the brain is important, as it will be possible to genetically engineer and re-create the body in the future with the help of nanotechnology. Not surprisingly, "neuro" is less labor intensive and requires less storage space, thus making it a more affordable preservation option compared to full body cryonics. Because both methods have yet to be successful, it remains unclear as to which may be more effective and conducive to future revival.

Proponents of full body storage argue that while the head is indeed critically important, it is not sufficient for a fully functional revival. The body is believed to be the site of memory and identity as well as the brain, especially concerning muscle memory and fine motor skills. While it may indeed be possible to regenerate a body based upon the information in the brain, this group of cryonicists worry about the extent to which the person will feel alienation or discomfort compared to those preserved with their original body. Full-body supporters are also concerned about the negative public relations that may come from severing and storing human heads as well as suspicion around possible financial motives given that it is much

more cost-effective for organizations to store only heads as opposed to entire bodies. On the other hand, neuro cryonicists believe the head is sufficient and that the lower costs make cryonics more appealing and feasible to potential patients.

Cryonics: Legal and Economic Aspects

Despite the fact that advocates do not consider their patients dead, cryonics can only be applied to the legally dead after a medical doctor has issued a death certificate. As such, it is considered a disposal technique, not unlike those of cremation and interment. However, unlike burial and cremation, cryonics is more time-sensitive inasmuch as the goal is to preserve as much brain function as possible prior to vitrification and storage. One option is to arrange to have a stand-by team alongside the dying patient. Another option is to have a local funeral director take possession of the body and prepare it to cryonicists' specifications so it can then be transferred to a cryonics facility.

Cryonics is a relatively new process and it requires advanced technology and long-term storage, possibly for centuries until revival is a scientific possibility. As such, cryopreservation is quite costly. The organizations offering the service vary greatly in price; estimates range from $28,000 (the price for the 2008) to $155,000 and depend upon whether the entire body or just the deceased's head is vitrified and stored. Additional costs also apply in order to secure bedside service where a cryonics team begins immediately cooling. Oftentimes, before reaching the cryonics facility, a local funeral director will be hired at additional costs to remove the body and prepare it, especially if the client is not geographically close. In order to be cryonically preserved, a person or his or her next-of-kin must become members of a cryonic organization with dues required prior to the client's death. Depending on the organization, some demand one-time membership dues whereas others also collect monthly dues. The major payment due at the time of vitrification and storage is typically paid for with life insurance policies. The Cryonics Institute, the largest facility in America, suggests that those interested in membership take $200,000 in life insurance as to cover any future price increases, but a minimum of $100,000 is highly recommended for those who cannot afford to pay with cash.

Cult Deaths

There is no single agreed-upon academic definition for the word *cult*, although it typically refers to a minority religious group, possibly with a charismatic leader, whose beliefs and practices are at variance from those of the majority culture. In popular parlance, the word *cult* is used to refer to any minority religious group that provokes concern, anxiety, and fear. Much of the contemporary anxiety about cults and minority religions is related to several well-publicized cases of suicide, murder, and terrorism on the part of a few religious groups in the final quarter of the 20th century. Incidences of murder and suicide involving members of minority religious movements are often described as "cult deaths."

The study of cult deaths developed in reaction to these violent deaths involving minority religions. Scholars in a variety of disciplines identified a need to examine, in an objective manner, the reasons why several minority religions had turned violent. The media reports of these incidents of apocalyptic violence tended to be biased, often depicting the groups concerned as "evil cults" with manipulative and "deranged" leaders who "brainwashed"

converts. As a result, the general public assumed that new religious movements (NRMs) were essentially dangerous and violent. Thus, in the opinion of many analysts, NRMs were groups that should be controlled or even prohibited. An anticult movement developed with the goal of protecting potential converts from, in their opinion, being coerced or even "brainwashed" into joining cults.

Approaches to the study of cult deaths have included theoretical analysis, in-depth case studies, and comparative analyses of the empirical research. Such research has focused on exploring predisposing factors that may turn NRMs toward violence. The rest of this entry addresses these issues in greater detail.

Historic Overview

In 1978, over 900 members of the Peoples Temple, including over 200 children, were killed or committed suicide in Jonestown, Guyana. In 1993, 74 members of the Branch Davidians, a Seventh-day Adventist sect, died as a result of a 51-day standoff with the U.S. government at Waco, Texas. Between 1994 and 1997, around 74 members of the secretive Order of the Solar Temple died in a series of ritualized murders or suicides in Quebec, Switzerland, and France. Between 1990 and 1995 the Japanese NRM Aum Shinrikyo carried out a series of attacks on the public, culminating in a Sarin gas attack in the Tokyo underground on March 20, 1995: Around 5,500 commuters were injured, and 12 were killed. In 1997, 38 members of Heaven's Gate committed suicide after their leader convinced them that a spaceship (supposedly hidden behind the passing comet Hale-Bopp) would rescue their souls from the pending destruction of planet Earth. In early 2000, around 780 members of The Movement for the Restoration of the Ten Commandments of God, a Catholic splinter group based in Uganda, also died in a series of murder-suicides. Put in perspective, this means that around 3.5% of NRMs known to the British information center have turned violent.

Problems With the Term *Cult*

In academic circles the term *cult* is used in a technical sense with no evaluative connotations. It is sometimes defined as an organized system of worship focused on a person or an object of reverence. Today, however, it is most commonly used in derogatory ways. In popular parlance it can refer to religious groups that are seen as deviating from the mainstream and as dangerous movements whose leaders manipulate innocent converts into committing illegal and unusual acts that they would otherwise never consider committing. The media and the anticult movement frequently describe this process as *brainwashing*, a term which, like the term *cult*, is generally avoided by scholars. Various studies have shown that converts join and leave NRMs of their own volition, albeit within an environment of sometimes considerable influence. From an academic perspective the concept of brainwashing is little more than a way of giving a name to a process for which families or friends of converts fail to find other explanations. Converts often dramatically change their lifestyles and beliefs (by, e.g., adopting a new name, changing their diet, living communally, giving up material belongings), and families and friends cannot accept that the convert could have changed to such an extent without having been manipulated against his or her will. A common explanation has been that leaders of NRMs exert irresistible and irreversible mind control techniques over potential converts. Several studies have shown that the majority of NRMs have high turnover rates, thus indicating that their techniques are neither irresistible nor irreversible.

Millennialism

One commonly shared characteristic of NRMs that have turned toward violence is having apocalyptic ideas at the core of their beliefs. One strand of millennial literature (frequently based on biblical sources such as the book of Revelation) predicts that earthly perfection will come to an end after a cycle of 1,000 years, culminating in the destruction of evil. Today, academics often use the term *millennialism*, removed from its original Judeo-Christian context and referring instead to a belief in the imminent end of the world, in terrestrial salvation, and in the development of a millennial kingdom (this-worldly or other-worldly). Some scholars have made a distinction between catastrophic and progressive millennialism.

Catastrophic millennialism is characterized by a pessimistic view of humanity and society. Humanity is regarded as so sinful that the world needs to be destroyed and created anew. In contrast, progressive millennialism is characterized by an optimistic view of human nature; this view was prevalent in the 19th century. The positive attributes of humans are seen as gradually improving the world.

Followers of catastrophic millennial groups believe that humanity suffers from a dearth of positive attributes and the millennial kingdom on earth can be established only by the use of violence and destruction. Both types of millennial groups often involve messianism, the belief in a person who has been empowered by God to create the millennial kingdom. A dualistic worldview dominates: The world is divided into good and evil, and/or us and them, and often leads to predicting, and in some cases even producing, conflict.

The two categories of millennial groups are not mutually exclusive. If a particular movement perceives itself as successful in helping to facilitate the millennial kingdom, the catastrophic aspects of millennialism may well recede and progressive aspects may become more dominant. If there is any conflict with external forces, the catastrophic expectancies and the dualistic worldview might become exaggerated. If catastrophic millennial groups feel persecuted by external forces and additionally sense that they are failing in achieving their millennial goal, it is possible that members would be willing to achieve this through the use of violence.

Another factor that may influence whether a millennial group turns to violence is whether the group has abandoned hope for the salvation of nonmembers. If this is not regarded as a possibility, efforts will be concentrated on the salvation of group members and violence will be more likely. The result can be violence directed at nonmembers who are perceived as the enemy, inwardly directed violence to control dissidents, or committing mass suicide in order to remove the group from an evil world and take it to a better place, or a combination of all three. However, most NRMs do not turn violent but adopt a more passive approach, believing that it is God's role, not the role of the believers, to conduct millenarian violence.

Predisposing Factors Leading to Violence

Millenarian groups share certain characteristics that may predispose them to become violent. These factors are not sufficient causes in themselves. John Walliss has identified three interlinked groups of predisposing factors:

1. Inherent Violence and Antinomianism of Millenarian Ideologies

Millenarian ideologies can have a predisposition to turn toward violence, as they often draw on violence described in apocalyptic texts such as the book of Revelation. Millenarian ideologies are often antinomian; a specific group might see itself as being under no obligation to follow the legal and moral laws prescribed by religious authorities. If one believes that one is living in the end-time and that the prevailing social order will be overthrown by God, it is quite likely that the individual will want to reject or change the current social order; this situation can make millenarian groups quite confrontational. Their ideologies have been described as "exemplary dualism," referring to the fact that millenarian NRMs often do not only see opposing groups merely as groups with different views but as being inherently evil.

2. Charismatic Leadership

Charismatic leaders require from followers an unchallenged belief that they have exceptional powers enabling them to accomplish a specific mission. In certain cases followers believe that their leader is, or has been, in direct contact with God. Charismatic leadership can be precarious in nature because such leaders constantly have to undertake "legitimation work" to demonstrate their charisma in order to retain their authority. If, for some reason, opportunities for legitimation are no longer available, the leader experiences a crisis of charismatic authority, which increases the risk of volatility and violence.

Cult critics frequently claim that it is the "insane" charismatic leaders that make these groups volatile, but it has been shown that it can be the breakdown of charismatic leadership rather than charismatic leadership itself that increases volatility. It is undeniable, however, that leaders of some groups do exert a remarkable amount of control and pressure on the group and the individual members.

3. Totalistic Nature of NRMs

The totalistic or authoritarian nature of some NRMs predisposes them toward violence. World-rejecting NRMs are characterized by a strong "us-them" dichotomy, accompanied by a physical and/or ideological distancing of themselves from the rest of society. During this process the convert is resocialized according to the group's philosophy. The greater the extent of the resocialization is, the more likely the individual is to arrive at a state that Edgar W. Mills termed *supercommitment*, where the individual is no longer an autonomous entity but displays unquestioning obedience. Tendencies toward such a state rapidly increase if a group has isolated itself so much that members are no longer exposed to values and norms differing from those of the group.

Factors That Can Turn Predisposed Groups Violent

Proponents of the interpretive approach state that millenarian violence is largely reactionary in nature and that NRMs tend to become violent only when members feel that their very existence is at stake or when they feel threatened by external opponents, such as governments, the media, and anticult activists. During a process termed *deviance amplification*, small initial deviation may spiral through processes of labeling and overreacting. Actions of opposing groups are interpreted as hostile when they are not necessarily so.

This process is connected to the fact that these groups, like any religious group, possess an "ultimate concern" that overrides any other concerns a convert might have. Most individuals would give up or change their millennial goal under difficult circumstances, but members of NRMs involved in violence are willing to kill or die for their ultimate concern. External opposition is unlikely to be a sufficient cause in itself, but it can play an important role as a catalyst to the internal crisis.

Types of Catastrophic Violent Millennial Movements

Catherine Wessinger categorized catastrophic millennial groups involved in violence into fragile, assaulted, and revolutionary movements. Millennial groups can have features of each type simultaneously and can move from one category to the other as they develop.

Fragile Millennial Groups

Fragile catastrophic millennial groups initiate violence in an attempt to preserve their millennial goal. Both the Peoples Temple and Aum Shinrikyo are examples of such groups. Both Jim Jones and Shoko Asahara, the groups' respective leaders, fostered internal weaknesses and tensions by setting millennial goals for the group that were impossible to achieve. This meant that they gradually failed to reassert their charismatic authority and the groups' millennial goals were perceived to be under threat. The Jonestown commune was suffering financially and from Jones's increasingly erratic behavior. Shoko Asahara, a self-proclaimed Buddha, prophesized that a nuclear disaster would end the world in 1999 unless the movement grew to 30,000 members. The group only grew to 10,000 members, which was not enough to establish the Buddhist millennial kingdom, and the group's criminal activities (members killed Tsutsumi Sakamoto, a lawyer who threatened to sue and potentially bankrupt the group) made group members feel persecuted when they were faced with external opponents such as law enforcement agents. They performed a series of murders before the attack on the underground in order to minimize any disruption to the group caused by defectors and opponents. The reaction of both groups was to turn inward and depict the outside world as essentially evil and sinful, increasing the totalistic nature of the groups. The Peoples Temple reacted by attacking and killing Congressman Leo Ryan (D-CA) and members of his party. Nearly all the members first killed their children and then committed suicide. The aim of the gas attack was to stop Japanese police from carrying out raids on the movement's communes.

The Order of The Solar Temple and Heaven's Gate also are examples of fragile millennial groups. The Solar Temple was a secret society in the neo-templar tradition drawing on Western esotericism. An increasing number of defectors, the revolt of their Quebec commune against the group's Eurocentric hierarchy, the failing health of their leader, and the public criticism of their leader by his daughter created internal stresses. The group

was under investigation by international police and had received negative publicity in Quebec. This was interpreted as a sign that humanity was not evolving to the higher state of consciousness that was considered a prerequisite for entry to the Age of Aquarius. This shifted their "progressive" expectations to "catastrophic" ones. In the 1990s the leadership decided that the end-time was imminent and that salvation was possible through ritualized suicides that would enable followers to transfer to another planet. Core members committed suicide, whereas those regarded as traitors were killed, as were those who were thought to be too weak and needing help to make the transition.

Members of Heaven's Gate believed that the earth was about to be destroyed, that humankind was beyond hope of being saved, and that their members were part of an elect group to be saved by benevolent extraterrestrials who were waiting in a spaceship hidden behind the Hale-Bopp comet. The spaceships failed to appear, and one of the leaders had already died. The decision was taken that the best option to attain salvation was ritualized suicide.

Assaulted Millennial Groups

Assaulted millennial groups are characterized by having been attacked by law enforcement agents who regarded them as dangerous. An example of such a group is the Branch Davidians, who were involved in a standoff with the Bureau of Alcohol, Tobacco and Firearms (ATF) and the Federal Bureau of Investigation (FBI) at Waco, Texas. What distinguished this group from fragile groups such as the Peoples Temple is that they never saw their millennial goal under threat. Being attacked only confirmed leader David Koresh's prophesies about the violence during the end-time and legitimized his charismatic authority. Throughout the siege there were ongoing negotiations with the FBI. They felt persecuted and eventually were willing to sacrifice their lives. The conduct of the FBI was heavily criticized. The Waco incident is a clear example of deviance amplification. Suggestions for a nonviolent outcome in a siege situation have been to offer the group the ability to hold on to their millennial goal even after surrendering. During the assault on April 19, 1993, the group must have believed that the prophecy was being fulfilled with their martyrdom. Seventy-four members died as a result of the attack; only nine members present in the house survived, some of whom have been sentenced to prison for being involved in the killing of ATF agents.

Revolutionary Millennial Movements

By definition, groups falling into the category of revolutionary millennial movements have an inherent predisposition for violence because they want to overthrow what they consider to be the illicit and evil government. Followers of such movements see the need to destroy the government violently in order to establish the millennial kingdom prescribed by God. An example of such movements is the Montana Freemen, an armed group who were involved in a siege by the FBI in 1996. They believed in individual sovereignty, wanted to establish their own government, and intended to overthrow the U.S. federal government. During this incident the FBI were advised to offer the group the option of surrendering without giving up their ultimate cause. The siege ended without injuries on either side.

Fortunately there have not been any cult deaths in the conventional sense in the past few years. The increase of terrorism and the number of suicide bombers who are willing to die for achieving their millennial goals has opened up a new area for research into the topic of cult deaths.

Curses and Hexes

The English word *hex* is derived from the German word *Hexe*, used to describe a witch or a curse. *Curse* is derived from the Old English term *curs* and is used to describe magically induced misfortune, although in modern usage it also refers to poor luck and bad language.

In the context of the human experience, curses and hexes are essentially the same and can be seen across human society; evidence for magical curses can be found in modern, medieval, antique, and primitive societies. These types of magical devices can be used for two purposes: to invoke the dead, spirits, or demons against the living or to protect the dead from the living or the living from the dead. The worldwide use of curses and hexes has led some psychologists to describe it as a subconscious rejection of humanity's inheriting mortality. This entry demonstrates this universality by describing cases from ancient Egypt, Rome, and Scandinavia, as well as medieval Britain. Cases for modern curses also are described, both in anthropological studies and in Western society, showing that they are not part of a religious experience but answer a much more basic need for control in the human psyche.

Curses and Hexes Used for Protecting the Living From the Dead

Hervör, daughter,
Why call you so?
Why such fell curses?
You do yourself ill.
Mad must you be,
All too witless,
And lost to wisdom
To rouse dead men. (Ellis, 1968, p. 160)

In antiquity there was a strong relationship between magic, curses, and the dead. This quotation was taken from the *Hervarar Saga* (IV), written originally in the Old Norse language. Like the rest of the Viking sagas, it provides a valuable historical insight into Old Norse beliefs. This particular saga deals with the story of Hervör, who travels to a haunted island where her dead brothers and father were buried. She seeks the magic sword Tyrfing. Despite her father revealing the future to her, particularly the evils the sword will bring to her household, Hervör collects the weapon. Curses in Viking sagas have a series of similarities: They are usually conducted in a liminal landscape—those that divide the living and the dead, such as cemeteries or howes (barrows or barrow cemeteries, which are mounds of earth raised over a single grave or ship burial)—and they are usually curses against the dead or against the living using the dead, elves, giants, or spirits as proxies.

Curses and Hexes Used for Protecting the Dead From the Living

Protection of the dead was a very real problem in antiquity, especially if the deceased was interred with objects still valuable to the living. Indeed, most grave robbing took place in antiquity and when archaeological sites like the Egyptian Valley of the Kings were looted. Ancient Egyptian tombs were protected by a series of traps, such as pits and false doors, and also by curses. Beneath its wrappings, the mummified body was protected by amulets. Collections of funerary spells such as *The Book of the Dead* were painted on the walls of elite tombs; they threatened to send dangerous animals or curses to hunt down tomb robbers. Despite this protection, archaeologists have never been put off excavating ancient tombs, even after the curse of Tutankhamun became widely reported after the death of Lord Carnarvon, just 1 year after the tomb was open. Howard Carter, the archaeologist in charge for most of the excavation, lived

another 17 years. However, the curse of the mummy entered popular culture and has since given rise to cult films like *The Mummy* (1932), *The Mummy's Curse* (1944), and *The Mummy* (1999) and its sequels. Curses used for protection of the living from the dead are also called *necromancy*.

Curses and Hexes Using the Dead Against the Living

The second form of curses and hexes are those cast against a living victim. Curses were cast against the ancient Egyptians' enemies, and the names of foreign foes or traitors were inscribed on clay pots, tablets, or figurines, which were then broken (ritually killed) or buried in cemeteries to weaken or destroy the enemy. Ancient Roman curses were heavily influenced by Egyptian magical practices, and a collection of some 1,500 curse tablets survive. Over 100 tablets were discovered from the Roman baths in Bath, England, and 60 more from a well in Caesarea Maritima, Israel. Those examples were made of lead but, as they seem to have been relatively common, many more may have been written on less-durable materials like hide or wood. Although most curse tablets were found down wells, nailed to the floor, or in tombs, there does not seem to be a direct association between death and Roman curses. Indeed, many seem to have focused on theft, legal proceedings, and court cases and to have mostly evoked gods, although the dead feature occasionally.

Curses are common among African rural communities, particularly in isolated groups. The Arivonimamo people of Madagascar practice a cross-generational form of cursing, by which the dead can come to the living and demand offerings and special treatments on the threat of cursing their descendants. Although this is an extreme example of the relationship between the living and the dead, it highlights the importance of this relationship to empower curses and cursing. Evidence of curses in medieval Europe has been found, and the mummified remains of a cat, probably linked to some form of magic, were discovered within a medieval roof in Lavenham, Suffolk, England. Modern witchcraft does not place such an importance on the dead, and candle magic and other forms of passive magic are practiced. However, the discovery of an 1831 book by Walter Scott, *Letters on Demonology and Witchcraft*, within the surrounding ditch of a Bronze Age round barrow on Uffington Hill, England, is probably related to the recent interest in new age religions. Placing this book on an ancient burial site demonstrates the association of neopaganism and archaeology, particularly the ancient dead, as a source of mystery and empowerment.

In summary, curses and hexes are a form of magic that can be used either to protect the living or the dead or as an attack on the living, but in either case they almost always use the dead as a method of empowerment. Curses and hexes need not be part of a pagan religion; they are manifested in one form or another in most human societies. Indeed, they are not necessarily associated with religious belief at all but fulfill a much more basic need within the experience of being human.

Cyberfunerals

The cyberfuneral, also known as funeralcasting or memorial webcasting, is the broadcasting via the

World Wide Web of an event to commemorate one's life and death. A funeralcast can be viewed live or delayed ("on demand") on single monitors or projected onto a screen for a large audience. Some providers attach the funeral webcast to personalized web pages that include photos, video clips, or a PowerPoint presentation. This entry discusses the availability of and requirements for cyberfunerals, notes the benefits and potential drawbacks, and identifies the emerging policy, ethical, and legal issues.

Availability of and Requirements for Cyberfunerals

Holding a cyberfuneral is dependent upon the availability of a webcast funeral service provider having access to a specialized computer server capable of distributing the webcast onto the Internet. More than 24 hours' notice is generally required to organize the funeralcast technology. Moreover, the number of computers used to simultaneously host the cyberfuneral depends on the capacity of the server, as the fees for the service are influenced by this quantity.

A computer with a high-speed Internet connection is needed to view a cyberfuneral. According to the Metropolitan Cemeteries Board of Western Australia, most late-model personal computers have the equipment needed to view a webcast: a high-speed processor, a sound card, and a video program such as Windows Media Player or RealPlayer. Audience technical support may also be available to troubleshoot challenges that occur while viewing the cyberfuneral. A password is required and is obtained from the funeral service provider.

Benefits and Drawbacks of Cyberfunerals

It is generally important for an individual to observe a funeral ritual, but it is not necessary to be physically present at the service. For example, participation in funeral rituals may influence adjustment following a death; therefore, it is important to consider the effects of cyberfunerals. Barriers overcome by funeralcasting include time limitations created by geographic distance, work obligations, or the requirements of a religious or spiritual ritual such as burial within 24 hours (according to Jewish law), limitations relating to physical or health factors, travel costs, or the need to care for young children. Deployment overseas may prevent a member of the military from returning home for a loved one's funeral, and comrades of a fallen soldier may benefit from observing a cyberfuneral.

Other benefits include the ability to archive online a videotape of the ceremony, thereby making the funeral available for viewing after the actual service. Time differences, as well as the desire to watch the funeral more than one time, can be accommodated.

To some individuals, cyberfunerals may be considered too impersonal, as they are devoid of social interactions that define many traditional funeral rituals. The potential for a cyberfuneral to become an "isolation ritual" exists because of this lack of active participation. Webcasts preclude the provision of social support in-person. A potential disadvantage of cyberfunerals is that these events may decrease the amount of support available to the bereaved. Although the use of similar technology in a second site would allow for interaction, the addition of such technology could be considered by some as intrusive. The potential also exists for disruptive behavior or inappropriate comments that cannot be predicted or prevented.

Policy, Ethical, and Legal Issues

It is common practice to require a password to access a funeralcast; this provides a sense of "privacy" and control over access to the cyberfuneral to the family of the deceased. As of late 2007, however, no formal policies existed to govern functions relating to cyberfunerals conducted by funeral service providers. However, one common rule of etiquette has evolved—the disclosure of the webcast through a posting at the funeral home and an announcement prior to the service. At issue is the privacy of attendees who may not desire to appear in the webcast.

The legal issues of permissions, copyrights, and licensing fees also are relevant. Releases must be signed by the clergy and others who speak at the funeral granting permission for webcasting. Music licensing fees paid by the funeral home account for the period of time that the webcast is available for viewing. If the webcast will display professional

photographs or copyrighted images, copyright issues must be addressed.

Cyberfunerals will undoubtedly become more prevalent as younger generations of funeral directors begin to offer this service, as the public becomes educated about funeralcasting, and as members of Generation X and subsequent generations assume responsibility for making funeral arrangements. Future documentation of the impact of this unique and innovative addition to the repertoire of services to commemorate one's life and death presents an interesting and important task for thanatologists.

Dance of Death (*Danse Macabre*)

The dance of death, or *danse macabre*, seems to have first appeared as a practice in the late 13th and early 14th centuries. It was expressed as a dance in allegorical form in which a group of the dead led a group of the living in a dance procession down to their graves to show the living that all are equal in death and that no one will escape death. It did not matter how high a station in life a person achieved, how much wealth was accumulated, or how much respect was gained. All would eventually come to the same status as a decaying corpse or a skeletal figure. This was the great lesson taught to the living by the *danse macabre*.

Ironically the procession of the living persons in the dance was arranged according to their societal status in life. In various art forms the pope, kings, bishops, noblemen, and, last of all, the peasants and the poor, were in the line of procession from beginning to end. A part of the lesson of the equality of death was the metaphoric living people all arranged in their various statuses in life going down into the grave where all of them without exception became the rotting corpses and skeletons found in the graves. Implicit also was the fact that God would judge each of them equally, with his justice based on their faith and good works in life.

The practice of the dancing seems to combine several historical traditions related to death that developed over hundreds of years. These include dancing on the occasion of death in churches and cemeteries; the use of a skeleton to represent death with a later, more formalized picture of death represented as a skeletal figure dressed in a long black cloak and hood and carrying a long scythe (the "Grim Reaper"); and the expression of death in many and varied art forms (in which it would be expressed as the dance of death in the late Middle Ages and early Renaissance). The art forms included music, paintings, woodcuts, staged drama, poetry, and other forms of literature. The appearance of the dance of death is still seen in 21st-century music, art, and literature.

The practice of dancing as a funeral ritual is reported to have even preceded the Christian era of history. People danced at interment and cremation rites before the birth of Jesus. It was often frenzied and fast paced with the dancers often stripping off their clothing and dancing nude among and on top of the graves and tombs. This was unlike the dance of death in the Christian era, which was much slower, more formalized, ritualistic, and organized. In the earlier times, the dancing was seen as a celebration of the lives of those who were still alive to enjoy the many pleasures and fruits of the material life, whereas those who dwelled where they danced had lost all of this by their death and passing on to whatever afterlife or spiritual dimension that existed among the various societies of those times.

In the early Christian era from the 4th century onward, the Roman Catholic Church actively opposed and sought to suppress the inherited pagan practice of fast dancing, of life celebration, in the cemeteries during funeral rites, during

funeral masses or rituals, as well as in funeral processions and cemeteries. In spite of hundreds of papal and ecclesiastical orders and banning the practice, it continued through the centuries in varying degrees. Ivan Illich called the churches and cemeteries veritable dance floors as this practice continued at death rituals, such as funeral services and burial ceremonies, through hundreds of years of post-Christian history.

It was during the later Middle Ages that the *danse macabre* began to be emphasized in all its varied forms of artistic expression. The first appearances in poetry, plays, and some visual arts were recorded in the 12th century. It was not, however, until the late 1300s and 1400s that the fullest expression of the *danse* would be reached. It has been suggested by a number of sources that this is probably the result of large numbers of death that decimated the European population during this period, including the first great wave of the plague, or black death. Contributing factors to this high death rate included many dying of starvation from numerous famines during the 1300s as well as other diseases related to fevers and other infectious diseases coupled with famine and other related deaths.

Examples of the dance of death in the arts include the following:

- The first fresco painting in the cemetery of the Church of the Holy Innocents in Paris in 1424. Various individuals from different social strata of European life are portrayed dancing individually with a decaying corpse. To represent the universality and equality of death, each individual is dressed identically and possesses the same features. Similar paintings appeared in Basel, Switzerland, in 1440 and Lubeck, Germany, in 1463.
- Woodcuts were done in Paris in 1486.
- The first recorded dance of death carried out in a print shop was done in Lyon, France, in 1499.
- Plays and drama incorporated the *danse* theme during this same period. Early French themed plays were basic short dialogues between the victims of death and Death himself. Later in the same century costumed skeleton dancers were incorporated into the plays.
- A textbook was printed during the 1460s that included a talk to the emperor by the person Death. Poems came out of the 15th century as well.
- In later centuries musical compositions began to incorporate the theme of *danse macabre*. This has lasted to the present. In summary, the historical customs and traditions incorporated into the dance of death concept appeared in the later Middle Ages as dance and then as poetic expressions of the equality and inevitability of death to all people of all social stations. Death, most often personified as a skeleton dressed in a long, black cape and carrying a long harvesting scythe, either dialogued or danced with individuals of different social levels and then led them from the land of the living down into the grave where they either appeared themselves or saw others as rotting and decaying corpses or skeletal remains. The great moral lesson to be taught was that all should prepare for death and be prepared to be judged by God for their faith and good works in life.

Daoist Beliefs and Traditions

To appreciate and understand the Daoist (also, Taoist) perspectives on death and dying, it is first important to grasp what may be called the cosmological vision presented in Daoism. Life and death are seen as elements in a greater, cosmological whole, a whole patterned by "the Dao," the overarching sacred term for ultimate reality. This is an

ever-changing and interrelated whole with neither beginning nor end, within which we find ourselves, as does every other creature, great and small, in the middle: the heights above never end, no matter where or who we are, and the depths likewise have no limit. The Daoist learns to move within this whole as an integral and intimate part, living without care to alter what is seen to be a truly marvelous and beautiful cosmos, and so lives well and long. Death is as beautiful and welcome as any other part of this integral whole, this cosmos patterned by "Dao," and so to appreciate that fact, it is to Dao that we first turn.

Although it is now considered merely a legend that the most famous of all Daoists, Laozi (also known as Lao-tzu), on approaching a border gatekeeper, was asked about the meaning of the great and mysterious Dao, the first line of his equally famous text, the *Daodejing* (also, *Tao Te Ching*), makes a most appropriate response to such a query. For the opening line of the *Daodejing* sounds much like a disclaimer for all that follows, as well as a profound statement of Daoist philosophy. He said, quite simply: *Dao ke dao, fei chang dao*. This opening line to a text that ironically goes on for another 5,000 words is usually translated along these lines: "The Way that can be spoken of is not the constant Way." However, given the many meanings of the word "Dao" and with considerations to the structure of the Chinese language, it might be better to read this disclaimer as: "The Dao that can be Dao-ed is not the constant Dao." What does this mean? As a disclaimer, it means that when asked to define Dao, Laozi simply responded that there is no adequate response to that question. Dao, as the "way" of all things, is beyond any description conceivable. Likewise, it is beyond any pointing, practicing, instruction, teaching, learning, or activity, even beyond the mere lack of such attempts. And any such attempt to comprehend Dao, to manifest it in whatever shape or form imaginable, will not and cannot come close to the Dao that is "constant," or the Dao as what *endures*. The Dao, in its essence and its truest form, cannot itself be "Dao-ed," that is, set before us as defined.

Yet Dao is also called by Laozi the "mother" of all things, meaning that all that exists arises out of Dao and will eventually also return back into Dao. Thus, no matter how "beyond" Dao is in its deepest essence, it is also most intimate to all that lives as well as all that dies. Dao is not a transcendent power or deity that lords over creation. Rather, Dao is the fertile ground out of which all arises, as well as that ground into which all must pass once again, without ever having left its embrace. The word itself, an ideogram, is composed of the word for a human head together with a word meaning "to proceed, to go forward," this second component looking much like a human foot. So the word embodies both a verbal and a nominal sense, and one can see both movement and direction within the word, especially evident insofar as an "eye" is part of the word meaning "human head." Dao is thus not only "the" Way, as a designated path or roadway, but also "going" on a way, making for some direction. In the ultimate sense, Dao cannot thus be itself "Dao-ed," for it is the Way *of* all things, the intelligent movement that infuses and guides all existence so inherently, so intimately that it cannot be brought before our eyes. But at the same time, Dao shows traces in this world of phenomenal existence because all of nature is itself, one could say, Dao-ed. This raises an interesting possibility, one that is at the heart of understanding the Daoist approaches to both life and death. Laozi made it quite clear that the Dao that can be Dao-ed is not the constant Dao, but what of the Dao that *can* be Dao-ed?

In Chapter 42 of the *Daodejing,* Laozi says: "Dao births one, one births two, two births three and three births the myriad things of existence." As great mother and sustainer of all existence, Dao first opens as "one," the Great One (*taiyi*), as what cannot be made more simple, for it is all uniting and all united. This Great One is also called the Supremely Empty (*wuji*), for it is the emptiness from which all existence flows and which yet contains all as the infinite. This was later diagrammed as the empty circle, and might designate the Dao beyond all comprehension, yet holding all of existence. The two that arise from this empty one are the pair yin and yang, whose diagram was also later called the Supreme Ultimate (*taiji*), for it represents the most fundamental features of all the manifested world of forms: change and relationship. Indeed, for Daoism all change *is* relationship and every relationship is inherently *changing*. The wisdom of this symbol (usually referred to as the yin and yang symbol) is that it succinctly captures the basic features of all change and relationship. Namely, all relational change

implies the following: (a) a polarity of correlative pairs, ultimately referred to as yin and yang, although these are merely symbolic of the infinite varieties of polarities found in nature, such as light and dark, cold and hot, masculine and feminine; (b) a cyclic or ever-returning movement, as the forms of change all recur; (c) the mutual birthing of these polarities (*xiang sheng*), as when taken to an extreme, yin will revert to yang, and also the fact that one inherently gives rise to the other, as is said even of being and nonbeing, life and death; and (d) the intimate interrelationship of all that exists, a fact of existence so profound that every part of creation is the direct effect of and efficacious cause for the whole of existence. The interplay of the two form the intricate, contextual web of all existence, manifested by Dao. Taken together, these—the Great One and the Supreme Ultimate pair of yin and yang—form the "three" that give rise to all creation. One might think of it as the empty circle of the One being "filled in" by the yin and the yang, such that the Two could not manifest without that emptiness and yet, quite paradoxically, the emptiness could not be recognized if not for the forms of existence changing in their multifarious relationships.

The cosmological view afforded by this understanding of Dao, both as unmanifested (the Dao that cannot be Dao-ed) as well as manifested (the myriad things seen through the lens of the yin and yang), is one of continual transformation (*wuhua,* the "transformation of things"). There is no force outside of the changing and infinite context that steers the play of existence, and there is, at least for the classical Daoists Laozi and Zhuangzi (also, Chuang-tzu), no moral value to what happens, nor a judge or process that decides one's fate based on the morality of one's actions. In fact, Laozi states quite clearly (in Chapter 18) that when the great Dao was lost, or abandoned, the virtues of humaneness and righteousness appeared. Although this was to change later in more ritualistically based religious forms of Daoism, the philosophical backdrop is a view of the cosmos as inherently ordered or patterned, while also spontaneously free. At the appropriate time, we are born, meaning the transformations of things leads to the gathering of energy that *is* oneself, and when the time is ripe, we die. Nothing is truly one's own. As Zhuangzi has it (Chapter 22 of the *Zhuangzi*), we are the very breath (*qi*) of the cosmos, of "heaven and earth," so who are we to either revel in life or decry death? Such evaluative thoughts only obscure and darken Dao, and such desires—to dictate the particulars of one's life or its course, or to fear and seek to avoid death—do not allow us to observe the mysteries of Dao, particularly its tenuous nature as the One. Zhuangzi uses the image of a blacksmith hammering a piece of metal into shape to depict how strange it would be for one to revolt against this process of change, for if the metal were to stand up and beg to be cast in a particular form, the smith would surely think it a most cursed piece of metal! For us heaven and earth are the furnace, and so it is best if wherever the "creator" might send us is also where we most wish to go.

This thoroughly integrated, contextual process of transformation is also completely without boundaries or borders, and it must not be forgotten that the two of yin and yang are not a duality, nor is there anything that is truly separate from this processive whole. Besides the fact that the Great One, Dao as unmanifested emptiness pervading all existence, "unites" all the myriad things, there is also the fact that the "breath" of which we and all creatures are made, qi, is likewise the vital energy that informs all creatures and *all phenomenal aspects* of creation. This means that what we call mind is not separate from body, nor is awareness separate from its object. As part of the interplay of taiji, qi can be characterized as essentially differentiated by yin and yang, the more diffuse, subtle, or ethereal qi being yang in nature, while the more dense, gross, and substantial qi is yin in nature. In terms of qi, Dao birthed the primordial qi (*yuanqi*), which then separated, according to the two of yin and yang, into heaven (*yangqi*) and earth (*yinqi*). As with all other elements of the cosmos, heaven and earth (*tiandi*) are not separate or separable and do not primarily designate specific places as unrealizable or asymptotic limits to yinqi and yangqi. As humans, we find ourselves between these limits, and as such we complete the "three" in yet another sense. As between, we are inherently contextualized (as opposed to "composed") by heaven and earth, yangqi and yinqi, and experience life as the ever-changing flow between heaven and earth. Our very bodies/minds are contexts of yinqi elements, such as blood, and yangqi elements such as qi itself, an ethereal soul that survives

death (the *hun*), as well as a corporeal soul that dies with the body (the *po*). Shaped as we are by Dao and infused with inherently relational elements (yinqi and yangqi), "life" and "death" are simply arbitrary markers, unreal borders, to what is in fact ever processing, ever changing, and intricately interrelated to the whole of existence by the One. This process of living in the middle of all contraries, between heaven and earth, is naturally "so-of-itself" (*ziran*) and is the space that Laozi likens to a bellows that inexhaustively, spontaneously pours forth all creation and which, invariably, swallows them back into itself again.

The priority for classical Daoism is thus in seeing things as they are, which means *responding* with things as they continually, relationally transform, and not becoming trapped by our judgments of right and wrong, good and bad, for they ultimately lead us into conflict, not only with each other but especially with what is, as it is. For when we desire things to go a certain way, we must at some point resist the flow when it does not align with our judgments, when it runs counter to our evaluative thinking. And the greater our resistance, the greater will be the force of our effort to change what already is, or the greater we must try to coerce change through willful action. But according to Laozi, Dao does nothing, yet nothing is left undone. That is, Dao by its very nature is effortless, spontaneous, and free flowing, characterized most essentially by *being,* not by doing. This is what Laozi calls *wuwei,* noncoercive action, or action that resonates with the inherent emptiness of Dao as the One, as opposed to the purposeful action that arises from evaluative thought. What is human is to resist the spontaneous process of Dao and impose an artificial order onto the natural world, an order of how we *think* things should be. This not only wears out our vital presence (*de*), but obscures the profound depths of Dao, the depths that open to the limitless, the infinite, the boundless, and the unliving and undead. That is, it obscures the Dao beyond comprehension and so blocks our realizing the inherent intimacy with this sacred Dao. Or as Zhuangzi has it (Chapter 23), we cannot become enlightened to "heaven's gate" (*tianmen*), through which all passes into existence and back out again, and through which gate flows the "treasury of heaven," a treasury that the sage knows well.

The Daoist sage, having the form of a human but lacking the "feelings" of humans (evaluative judgments and their inherent desires), is also described by Zhuangzi as being selfless, spiritual, and without name or renown. As the "genuine person" (*zhenren*), the sage understands the spontaneous workings of heaven as well as of his or her fellow human beings but, bound by neither, is free to consort with all things. He or she neither loves life nor fears death, seeing them together as a single body, and is able to roam the world unperturbed, having found a home in the boundless. Living beyond the bounds of the two (or the human realm of distinctions), yet still one with the transformations of things, such a sage was said to be able to enter fire without being burned and enter water without becoming wet, even to soar the heavens, sustained only by the vapors and dew. Laozi similarly describes the sage as having the softness and suppleness of an infant, while appearing "blockish" and dull to his or her fellows, for the sage remained as the uncarved block: utterly simple. Certainly such a genuine or true person realizes, in the most profound and ecstatic sense, his or her oneness with the supreme emptiness of Dao, the Dao that cannot be Dao-ed, and so also realizes the source of all life, the origin of all that exists, as that which itself neither lives nor dies, and so is, in a way, immortal.

Surely this is the freedom that Zhuangzi so rapturously describes, and this is the enlightenment (*ming*) that "evens things out," that loosens the grip of the mind from its conceptual dualities and perspectives and allows one to "live out the years assigned by heaven." For Daoists such as Zhuangzi, this was the epitome: to flow with the coursing Way of all things without the slightest resistance, so as to never dull our blade of vital presence (de), much like the fabled Cook Ding was able to carve oxen so expertly that his knife never needed honing. To cleave to the One without disturbing the transformations of things is to know, beyond comprehension, the emptiness of the enduring Dao, the being beyond all dualities, including life and death. As for techniques to attain such a state, Zhuangzi gives us the ways of "forgetting all things" and the "fasting of the heart-mind" (*xin*), both on par with "becoming tenuous" or empty to the utmost, as advised by Laozi (Chapter 16). That is, the mind by its very nature divides, sorts, classifies, and

defines all that arises, even to the extent that it gives boundaries to, and so constitutes, what is even called a "thing," and when we take these mentally constituted boundaries as real, we miss the One, the empty Dao, and so it is as if heaven's gate remains closed to our vision. This blindness is a common kind of "forgetfulness," but one that forgets what must not be forgotten; instead, Zhuangzi advises that we fast the mind of its life-blood and set outside of ourselves all distinctions, even those of body and self, invested in a kind of loss, such that, as Laozi says, we lose day by day until "nothing is done" (wuwei). Living beyond the world, what harm could befall one? Where is one to go? With the realization of the One, the entire universe can be known without leaving one's house, for all has been gathered together in the emptiness of Dao.

Of course, later Daoists were to devise many other techniques and methods for attaining immortality—sometimes in literal terms of physical immortality—to achieve the ecstatic wanderings described most vividly in the *Zhuangzi*. Typically these methods involve cleansing and harmonizing the energies of the body and mind, particularly the qi and the "essence" (*jing*), so as to either reduce or stop the aging process as well as to form a kind of spiritual fetus that may be entered upon death as a kind of immortal vehicle for the soul and spirit. These exercises require an intricate knowledge of the energies of the body/mind and involve active forms of meditation that employ rich images and symbols to both move and purify the qi and jing. Thus, knowledge of the natural transformations of the body/mind is supplemented with a kind of alchemical transformation, whereby the coarse energies are purified into higher forms of spirit in the hope of attaining immortality. This is clearly not implicitly a resistance to the transformations of things, as it inherently makes use of the patterns of change and the relationship of yin and yang, as well as for the fact that such practice brings one more in alignment with the contextual, coursing Way of all things. Thereby, it may be recognized as being in fact a close neighbor to the "let it go, let it be" attitude of the classical Daoists, for such practices are parallel to the examples of craftspeople used by Zhuangzi to show how ultimate mastery goes "beyond skill" and exhibits effortless action (wuwei). When one does nothing yet nothing is left undone, the immortal has been realized.

Databases

The reporting of death and its circumstances has been an important public health function throughout history, as societies try to account for when and how their members die. Increasingly powerful mainframe and personal computers, database software, and the Internet have revolutionized the reporting of death and have led to the development of databases in which large amounts of information about death can be stored electronically. These databases are maintained by various organizations, including public local, state, and federal agencies as well as private organizations. In the United States today, information about death is reported in many databases that have different data stewards and varying policies regarding access. This entry describes the various types of death databases, their uses, completeness, and accuracy.

Types of Death Databases

In the United States the standard death certificate reports the characteristics of the decedent as well

as the date, time, circumstances, and underlying cause of death. This document is completed by the decedent's physician, funeral director, or medical examiner, depending on the circumstances of death. Death certificates are usually collected by city or county governmental organizations and then transmitted to state vital statistics offices that are responsible for organizing and maintaining databases of electronic death records that contain information recorded on the death certificate. Both state and county offices respond to requests from relatives and other interested parties for individual death certificates. States may also make their databases available to researchers, although special permission is required for access to personal identifiers such as name and social security number. The individual states vary considerably with respect to how they treat the confidentiality of death records and how readily they make death records available. For example, the State of New Jersey provides free of charge annual files of public death records on its website, although special procedures must be followed to obtain personal identifiers. Other states are much more restrictive in making even public versions of their death records available. There is also variation concerning the amount states charge for individual death certificates as well as aggregate records.

Ultimately states provide their death records to the Centers for Disease Control and Prevention (CDC), which compiles reports about death in the United States. There is no readily available national database of death records or certificates in the United States, although the National Center for Health Statistics of the CDC supports the National Death Index (NDI), which is a death ascertainment index or matching service for investigators conducting medical and health research. The NDI does not include deaths that occurred prior to 1979 and is not available for administrative or genealogical uses. The NDI Plus, which is part of the NDI, includes selected items from the standard death certificate and can be obtained by researchers, who must make special application and pay the required search charges.

The Social Security Administration (SSA) Death Master File (DMF) is a national-level file that is extracted quarterly from the NUMIDENT, which contains information about each individual who has been assigned a social security number. The file itself contains decedent name, social security number, date of birth, date of death, state or county of residence, zip code of last residence, and zip code where last payment was received. The SSA-DMF contains over 80 million death records, which are culled from a variety of sources, including relatives, funeral directors, banks, post offices, and state vital statistics offices. Deaths occurring prior to 1960 are included, although most deaths are from 1960 and later. This file can be purchased by individuals and is also used by many different organizations whose missions are as diverse as credit reporting, mass mail marketing, or genealogy. Several genealogy sites offer free death record searches with the SSA-DMF. The SSA also offers a "presumed living" search service to health researchers. This service searches files in addition to the NUMIDENT to determine if an individual is alive. Researchers must apply to use this service and are required to pay fees.

There are other death databases that contain vital status information on select groups of individuals, such as veterans. Typically, access to these information systems is highly restricted. Examples of such databases include those maintained by the Department of Veterans Affairs and the Department of Defense. Both of these organizations, which provide a vast array of benefits to active duty and retired military personnel, need to have accurate vital status information on their beneficiaries. Another type of database is an obituary archive, which contains death notices from selected newspapers across the country. Again, the Internet provides easy access to these resources.

While obituary archives usually report deaths occurring within the past 10 years, there are many archival sources that report deaths from many years ago. These include county and state historical societies, state governments, and the U.S. Census Bureau, which makes its Decennial Census of Population and Housing publicly available 72 years later. Thus census records from 1790 through 1930 are available on microfiche located at the U.S. National Archives and Records Center in Washington, D.C., at archives regional centers, and at select federal records centers throughout the country. The Church of Jesus Christ of Latter-day Saints also has extensive genealogical resources and offers free death searches with the SSA-DMF

and other historical national and international databases it has developed.

Uses of Death Databases

As seen from this inventory, there are several uses of death databases. First, there are administrative uses in which the government tracks the vital status of individuals, as well as groups. Tracking individual vital status is critical, as both local and federal agencies (e.g. SSA, Department of Defense, state and county human service agencies) administer a variety of programs that provide income and other support to individuals. Second, both state and federal governments produce extensive reports about death in the aggregate; these reports include descriptions of the facts of death as recorded on the death certificate. At the national level, the CDC issues extensive reports about death, including date and time of death; decedent characteristics such as age, gender, race, veteran status, tobacco use, and occupation; underlying cause of death, including injuries; and place of death.

Death databases are also used extensively by private entities, including individuals and businesses. Individuals are often interested in learning more about their ancestors or may need to determine what has happened to a lost relative. With respect to business, the growing interest in genealogy, as well as the burgeoning use of the Internet, has led to the creation of numerous genealogy websites that offer both search services and software for developing genealogies. Corporations also need accurate and complete death databases for ensuring that deceased individuals do not receive benefits that cease at death. Mass mailing firms are also concerned with maintaining accurate lists, and a whole industry has developed around searching for hard-to-find individuals, including those who have died.

Researchers in medicine and epidemiology also need accurate and complete death databases, as vital status is a key outcome in most studies they conduct. Those researchers whose studies enroll thousands of subjects often do not have the resources to contact each participant to determine vital status. Moreover, searching the SSA-DMF one record at a time for a large number of individuals is not practical. Sufficiently funded studies will have the resources to purchase the SSA-DMF to permit searching for a large number of individuals. Such studies will also make use of the NDI and SSA "presumed living" search, although for studies with more than 100,000 subjects, searches can be costly.

Completeness and Accuracy

All parties who use death databases must be concerned about the completeness and accuracy of these information systems. The NDI is often viewed as the "gold standard," as it contains elements of the death certificate that is the basis for the reporting of death in the United States. However, access to the NDI is restricted to researchers, so for most, there will only be general concerns about completeness and accuracy. Many of these matters have to do with the validity of the underlying cause of death, which may be particularly difficult to determine in deaths due to external causes, such as accidents, assault, or intentional self-harm. In certain situations, the medical examiner or coroner must determine intent—that is, whether death was accidental or self-inflicted.

Although in some studies, performance of the SSA-DMF with respect to the NDI was favorable, there remain some concerns about completeness of the SSA-DMF. First, deaths of beneficiaries may be more likely to be reported than deaths of individuals who did not receive benefits. Consequently, reporting is more complete in the later ages of life than at the younger ones, as older individuals are more likely to be beneficiaries. Second, not all states report deaths to the SSA for purposes of identifying fraud and abuse. Despite these limitations, there are advantages to the SSA-DMF as compared to the NDI. First, the SSA-DMF includes deaths prior to 1979; second, it is widely accessible and inexpensive to use; third, it includes individuals who have a social security number and die outside the United States, whereas the NDI reports deaths occurring only in the United States and its territories; and fourth, misreporting of the social security number may be less frequent than other information on the death certificate. For researchers using a combination of the NDI, SSA-DMF, and the SSA, a "presumed living" search may be the optimal strategy for complete ascertainment of vital status.

Summary and Future Directions

In the United States there are numerous death databases, but only one with relatively complete current vital status information is available to the general public, including those interested in genealogy. The SSA-DMF has many advantages, although there remains the lingering question about its completeness. Access to death databases such as state death records or the NDI is restricted by purpose of use as well as privacy concerns. This may limit ascertainment of vital status for those who die at younger ages. It must be asked how much more information about death the general public needs to know. Aside from completeness, should the circumstances of death be made public? Although newspapers may report the circumstances of high-profile deaths, including those caused by assault or self-inflicted injuries, it is most likely that the circumstances of death will not be made available for all individuals who have died in recent years. However, details about the circumstances of death for individuals who died many years in the past are of interest, as evidenced by the growing number of websites with archives of death records from at least 50 years ago. Again, the potential of the Internet is virtually unlimited for the development of electronic historical death records, although sufficient resources are needed to digitize records, purchase servers, and develop websites. Development of these death databases will be of value to a variety of individuals and organizations who want to better understand the when and how of death in the past as well as today.

Day of the Dead

From early times to the present, Mexican culture has embodied themes of death, sacrifice, and destiny. Once a year, starting at the end of October, Mexicans celebrate death in a national fiesta known as *Día de los Muertos* (Day of the Dead). During the festival, the living invite their dead to join with the family and to share a meal and time together before they return to the land of the dead. This Mexican holiday originated with Aztec festivities held in late July and early August.

In the Aztec world, death was extremely important. The destiny of a soul after death was determined by the manner of death, rather than by conduct during life. The journey to the land of the dead differed depending on whether a person died suddenly or in a particular manner, such as by drowning or by lightning. Deaths in combat or in childbirth, as well as deaths in connection with ceremonial sacrifices, were especially significant. Warriors who died in battle went to a region in the sky where they accompanied the sun god on his daily journey from dawn to noon. The sun's warrior companions took the form of hummingbirds or butterflies, symbols associated with rebirth. Individuals who became sacrifices were awarded a glorious destiny in the third heaven, and women who died in childbirth (with a "prisoner" in the womb) were considered to have died just as honorably as warriors and had a place in

the heavens, accompanying the sun from midday until sunset.

Among the Aztecs, the creation of the world was made possible by sacrificial rites enacted by the gods, and human beings were obliged to return the favor. Sacrificial victims in Aztec rites were termed *teomicqueh,* the "divine dead." Within the divine–human covenant, they were participants in a destiny determined at the origin of the world. Through sacrifice, human beings participated in sustaining life on earth as well as in the heavens and the underworld.

When Spanish priests arrived in Mexico, they attempted, in vain, to suppress Aztec rituals for the dead. As a result, Día de los Muertos is now celebrated during the Catholic feasts of All Saints' and All Souls' Days. The Spanish contributed elements from the medieval tradition of the Feast of Fools (associated with *Carnaval; carne vale,* "farewell to the flesh"), where everything is open to criticism, ridicule, and mockery. This humorous tradition is part of Día de los Muertos. Thus, the fiesta combines ancient rituals and customs with features of introduced Catholic traditions. In many parts of Mexico and the southwestern United States, it is a popular holiday with observances of cultural and social importance.

Features of the Modern Fiesta

Día de los Muertos is a special occasion for communion between the living and the dead. The rituals, food, and objects, as well as particular practices of remembering the dead, vary throughout Mexico. During late October, the markets of the villages and towns are filled with special handmade items for the fiesta. In fact, some of the most interesting *cosas de muertos* (things of the dead) are designed to be eaten by the living. Bread in the shape of human bones, sugar-candy skulls, and cardboard coffins poke fun at death. Pulling on a string at the end of a cardboard coffin will open the top and pull up a skull-shaped *muerto* (dead one) to a sitting position. People from all walks of life are portrayed as *calaveras* (bones or skeletons.) The professor and the pilot are constructed of papier-mâché in the form of skeletons. In the marketplace, there are 3-foot-tall candles for lighting the gravesite and *cempaszuchitl* (marigold-like flowers) whose petals traditionally are strewn to guide the dead on the path to the family home.

Pan de muerto (bread of the dead) is an essential food for the fiesta. It is generally made from a light, sweet yeast batter and baked into a characteristic shape depending upon the region of the country. For example, the *pan de muerto* typical of Mexico City is a round loaf topped by a stylized skull and crossbones. In some places the round loaf is topped with dough in the shape of bones.

The tradition of the calavera as a central icon for the celebration of Día de los Muertos is thought to echo the Aztec skulls elaborately decorated for use as masks or offerings. The sugar skull is a form of calavera that is widely available in the marketplace. Made of sugar and water and decorated with reflective eyes and facial markings made of icing, the sugar skull has a place on the top for your name. In eating your own skull, the thought is that you become a *compadre* (companion) of death rather than its adversary. Sugar is also used to construct various animals who will accompany the dead on their journey to and from *Mictlan,* the place of the dead.

The calaveras sculpted in sugar, clay, or papier-mâché or created from elaborate paper cuttings are used as a reminder that all of us will, one day, become dead ones. Under each person's skin are those bones, and the calaveras send a message that we need to recognize that fact and become accustomed to the idea that we will die.

The tall candles used in the festival are placed on both the *ofrenda* (altar) and the grave. It is believed that the spirits of the dead need light to find their way back to the living on their journey to join us. In some communities, the quantity of candles signifies the number of dead ones who are being welcomed home.

As a part of the festival, the families go to the cemetery to prepare for the return of their dead. There are generally few, if any, caretakers in the graveyards of Mexico. The rituals of cleaning graves, repainting crosses, pulling weeds, redecorating stones, and decorating with flowers is both a rejuvenation of the gravesite and a display of welcome for the dead. Even in the "perpetual care" cemeteries of the United States where Día de los Muertos is celebrated, families will gather at graves to clean and decorate them in anticipation of their dead one's return. A party-like atmosphere

occurs in the graveyards with families, including children, visiting with each other and their dead loved ones. At night during the fiesta, in Xoxo, Oaxaca, the small cemetery is ablaze with lights from tall candles placed around the graves. A *mariachi* band circulates, playing tunes for the living and the dead while vendors sell food and drink.

During the festival, families build an ofrenda in the home. The placement, size, and materials used to construct the altar for the dead vary throughout Mexico. In general, an altar is covered with a cloth, although other coverings might be used depending on the region. Pictures of the deceased, and sacred images such as pictures of Mary, Jesus, or other saints (e.g., the Virgin de Guadalupe) are placed on the altar. Food for the ofrenda might include a labor-intensive dish of chicken *mole*—a spicy sauce of some 50 ingredients including chili peppers, peanuts, and chocolate—or other dishes that were favorites of the deceased. Items familiar to deceased loved ones, such as a package of a particular brand of cigarettes or a bottle of *mescal,* are set out to entice their spirits to return to the family during the fiesta.

When the ofrenda is complete, on the appropriate day determined by tradition, the dead are called home to be with the living. In some places, families set off rockets or large firecrackers to announce to the dead that it is time to come. In some communities, the dead will join the living in a meal, although only the dead may eat from the ofrenda. Children are warned that the sweets, bread, and delicious offerings are first given to the dead. The living will eventually eat them but only after much of their essence and flavor has been consumed by the dead.

Traditionally Día de los Muertos begins at midday on October 31, as bells toll to mark the return of dead children—*angelitos* (little angels)—whose purity of heart is said to make them effective in mediating between the world of the living and the realm of the supernatural. Such purity of heart is thought to be especially true of children under the age of 4. The next day, families gather at the church. Bells are again rung at noon to signify the departure of the "small defunct ones" (children) and the return of the "big defunct ones" (adults). Among the most traditional observances of the fiesta are those held in the Zapotec villages in the Valley of Oaxaca (such as Xoxo) and on the Island of Janitzio in Michoacán.

The celebration reaches its peak on the evening of November 1 and into the next morning, when thousands file into the small candle-illuminated graveyards carrying tamales, pumpkin marmalade, chicken mole, and pan de muerto. People sit on the graves and eat in the company of the dead ones. They bring guitars and violins and sing songs. There are concession stands where food for visitors is sold. The celebration goes on all night long. It is a happy occasion—a fiesta, not a time of mourning.

Significance of the Fiesta

In his study of Mexican identity, *The Labyrinth of Solitude,* poet and essayist Octavio Paz observes that Día de los Muertos is a time for revolting against ordinary modes of thought and action; the celebration reunites contradictory elements and principles, bringing about a renewal of life. The rituals honoring and remembering the dead not only connect members of the community, they also reinforce the belief that death is a transitional phase in which individuals continue to exist in a different plane while maintaining an important relationship with the living. Celebrants challenge the boundaries that ordinarily separate the dead from the living. The souls of the dead reassure the living of their continued protection, and the living reassure the dead that they will remember and nurture them in their daily lives. It is important that families pay their respects to the dead, but mourners are cautioned against shedding too many tears; excessive grief may make the pathway traveled by the dead slippery, burdening them with a tortuous journey as they return to the world of the living for this special celebration.

In Mexican culture, people often confront death with humorous sarcasm. Death is cast as an equalizer that not even the wealthiest or most privileged can escape. The emotional response to death is characterized by impatience, disdain, or irony. The skeleton has been called "Mexico's national totem." The popular engravings of Mexican artist José Guadalupe Posada resemble the medieval *danse macabre,* in which people from all walks of life dance with their own skeletons.

The somber mood of Hans Holbein's depiction of Die Totentanz, *or Dance of Death, contrasts with the treatment of the same theme by Mexican artist José Guadalupe Posada. In Holbein's medieval woodblock print,* The Child, *we see the anxiety of family members as the skeletal figure of death ominously takes a child; in Posada's print, there is a sense of gaiety and festivity. Although expressed differently, the two works convey a common message: Death comes to people in all walks of life; no one is exempt.*

A striking awareness of death is displayed in graffiti and ornaments that decorate cars and buses. Newspapers revel in accounts of violent deaths, and obituaries are framed with conspicuous black borders. The suffering Savior is portrayed with bloody vividness. Mexican poetry is filled with similes comparing life's fragility to a dream, a flower, a river, or a passing breeze. Death is described as awakening from a dream-like existence.

Commenting on how these themes are displayed in modern-day Mexico, Paz says that death defines life. Death, like life, is not transferable. Folk sayings confirm this connection between death and identity: Tell me how you die and I will tell you who you are. Although a heightened awareness of death is part of everyday life in Mexican culture, it is given special emphasis during Día de los Muertos, as people gather to commemorate enduring ties between the living and the dead.

Death, Anthropological Perspectives

Death is not a new interest for anthropologists, but how it is depicted has changed. Typically, earlier ethnographers inserted death, a biological given, into their descriptions of rituals, religious beliefs, and memorial practices. Few theorized death itself. Since the latter part of the 20th century, however, physical death as a topic in its own right has become prominent, due in part to critical theory and concepts of biopower and biopolitics taken from the work of Michel Foucault. Other factors are the aging of the American population, new technologies for sustaining life, and the rise of palliative and hospice care. More recent anthropology explores death and clinical medicine, end-of-life decision making, the consequences for patients and families of life-extending technologies, changing styles of grief and bereavement, and ways the dying body is subjected to manipulation and variable interpretation. Controversies surrounding physician-assisted suicide, organ donation, and the highly publicized deaths of individuals trapped in long-term persistent vegetative states fuel this newer interest as well. This entry reviews first the ethnographic coverage of death in selected cultures. The work of anthropologists who study dying and its complications in the postmodern world of sophisticated technology and institutional medical management also is covered.

Theorizing Death

One of the earliest and still influential attempts to theorize death was that of Robert Hertz, a French anthropologist who in 1907 puzzled over secondary burial, reported among various groups in Sarawak. In this practice, bodies of the deceased are stored in large jars buried in the ground. After a time they are disinterred, the bones cleaned, and skulls displayed in the houses of their former owners. Versions of secondary burial are widespread in human societies (the medieval European traffic in sacred relics is an example), and Hertz argued they are more than mere curiosities. He saw the death beliefs and practices of any culture as elements in a coherent system built around three relationships: that between the living and a corpse; the inert body's release of vital spirit and its transition to a place of repose; and ongoing connections between these transported spirits or souls and remembering survivors. While the details and emphasis of course vary from place to place, the underlying system creates an orderliness that structures the sense of loss that any death inspires.

While not all subsequent ethnographers adopted the Hertz model, the abundance of ethnographic material they gathered can be conveniently presented in terms of its three-part relationships. The first, the preparation and disposal of a corpse, is foundational; body handling is an indicator of the significance of the deceased in life and an occasion for status display by the surviving family. That point is obvious enough if we compare the funeral practices associated with the death of a president with those for a pauper. It is equally evident in any funeral company's showroom, where caskets range from simple wood boxes to the expensively elaborate, and survivors are advised to choose something appropriate for the deceased. That pattern fits the expectations of a market-driven economy in which choice is one measure of consumer satisfaction. But even in an industrial society, it is not everyone's preference. Very much a

contrast is the intensive, ritually driven body washing and wrapping that is the task of a *chevra kaddisha,* a traditional Jewish burial society. Here the goal is to efface social markers, thereby purifying the corpse according to the principles of an ancient tradition. Simplicity is what matters; in preparation to meet its divine source, the self must be freed of the clutter of the mundane. That is true also for Hindus, who bring their dying to Banaras on the river Ganges. For them, the purifying agent is not water but fire. As death nears, the dying shun food and water, an austerity that will speed the departure of the *pran* (vital breath) from the corpse when it is burned on a pyre at the river's edge.

Strikingly different from these examples are the body disposal practices of the precontact Wari peoples of the Amazon, who once expressed their compassion for the dead in an unusual but, to them, sensible way. Out of respect, they cooked and ate portions of the corpse. Ground burial (probably suggested by missionaries and the current practice) was unacceptable because a buried body in a known location was a reminder of sadness whereas a consumed one was not. Eating was to eradicate memory, not preserve it. As Hertz theorized, this method of body disposal was congruent with Wari notions of personhood, cosmology, expression of grief, and memorialization. Personhood for them was a matter of relationships and lifelong reciprocities, less the internalized, nurtured self of American practice. Thus eating the deceased is a final act of sharing, the Wari way of making sense of the existential meaningless that every death implies.

Souls

At some point following death, a corpse gives up its animating principle, which then travels to some distant, perhaps sacred, place. This body/soul contrast is the second polarity in Hertz's three-part model. In the Hindu system, for example, the afterlife is variously depicted as reunion with ancestors, rebirth in another condition, or escape from the cycle of rebirth and dying altogether but, wherever it goes, the pran makes that transition more or less automatically. In other places, transcendent movement must be nudged along, sometimes strenuously. In rural areas of modern Greece, final entry into paradise is gained, in part, because the living labor on behalf of the deceased through prayers, church masses, and regular, even daily, grave visitations over a number of years.

A challenge also exists for the dead in areas of Sarawak, where souls arrive at a realm of ancestors only after a difficult and hazardous journey, sometimes characterized as travel up a river with many side streams that are confusing and dangerous. The current residents of Brittany in northwest France, however, dispense with all such effort despite a long history of death ceremonial. Consistent with modern doubts about older characterizations of heaven, purgatory, and hell, the Bretons' concern, quite literally, is nearness to relatives. A *caveau* (house-like structure) holding up to a dozen family caskets is built in the cemetery. Eternal rest with kin is more important than residence in a doubtful place of eternal light and angels. But North Americans who claim to have had a near-death experience would strongly disagree. They say they have been to the other side, traveling to it through a frightening tunnel of darkness and toward a Being of Light. On arrival they were reunited with family and friends. Whatever the truth of these claims, as narratives they have specific cultural and historical antecedents in the writings of the 18th-century intellectual Emanuel Swedenborg. He broke with the old medieval pattern of purgatory and hell and his mystical, almost domestic vision was subsequently popularized in the paintings of William Blake. It persists today in popular imagery in bereavement cards, sermons, cartoons, and a plethora of self-help spiritual guidebooks.

These accounts assume the singularity of a soul. In parts of Melanesia, however, individuals can have more than one soul, and that has its uses. Multiple souls have diagnostic significance, their gradual departure one after the other an explanation for late-life illnesses and slow decline into death. Souls commonly leave the body, as in dreaming, but when they travel so far that they cannot reconnect with it, death results. Whether multiple or singular, however, the action of soul or spirit entities reveals the intricate interlocking of beliefs about the moral meaning of the body, the nature of personhood, its survivability, and the eschatologies that give shape to this world and to invisible realities beyond it.

The Living and the Dead

The third relationship in Hertz's model is that between the living and their dead—grief, bereavement, and memory. Like body disposal and soul beliefs, styles of grief are highly variable and one of the more dramatic examples in the anthropological record is that of the Sora, a tribal people in eastern India who have lived there longer than the surrounding Hindu majority. They regularly engage the newly dead in animated postmortem conversations facilitated by female shamans who voice the wishes and especially the complaints of the deceased. There are grievances to settle, and these are aired in lengthy, public dialogues that are painful, sometimes humiliating, and occasionally humorous. The dead can be dangerous if they choose; they can threaten to visit the cause of their demise onto those still living. Eventually, however, over a series of difficult and even raucous encounters, reconciliation is achieved and the dead agree to drop their demands and, to the relief of the living, abandon the conversation.

Although less dramatic, exchanges between the living and dead are common in Western cultures. The long European history of ghosts and frightening hauntings is, as among the Sora, about aggrieved individuals who in death do not go away as they should but remain to pester the living. That threat has been tamed in the contemporary world, but their presence is still evident. Sightings of deceased husbands and other signs of their ghostly nearness are common according to studies of urban widows in the United Kingdom. So too are graveside conversations, even if one sided. The well-known *Día de los Muertos* in Mexico is also an occasion for the dead to return to family and familiar places. As their part in a communal cult of the dead, the living construct home altars decorated with objects (*ofrendas*), mementos once important to the dead, and these can range from food to liquor to books, photographs, and religious icons. Souls are expected each November 2 (All Souls' Day) and are attracted to and appreciate what has been prepared for them. Much more cursory is the North American holiday, Memorial Day, with its brief visits to family graves to tidy them up and leave flowers.

All such practices of remembering in private memory and communal event, or of intentional forgetting as an expression of honorable regard, are instances of a newer way some researchers are conceptualizing grief and mourning. This model emphasizes continuing bonds, the living learning to live with their dead in a new, revised relationship. The Sora illustrate this clearly in that the newly dead have unfinished business; despite the discomfort of their verbal jousts with survivors, when misunderstandings are aired and forgiveness is extended, the ghosts go in peace. This contrasts markedly with the English-speaking world's preference for private, heroic endurance, "grief work," the strategy for promoting "resolution" and "closure" so the living can "move on." The ethnographic record suggests this is not the norm. So too does recent counseling with the parents of deceased children in support groups. In the continuing bonds model, parents are encouraged to cultivate a new, open-ended relationship with their dead child, one that is continuously revised and evolves over the years. Further, this experience of grief is communal, as is true of many cultures where mourning is shared in extended families, gatherings of friends, and in conversations in the village square as among the Sora. The distinctive American preference for privatized grief and gradual exile of the dead from communal awareness is likely associated with the rise of modern individualism, social and economic mobility, and decline in the authority of traditional religious teachings on the afterlife.

Dilemmas of Hospital Dying

The ethnographic examples cited so far suggest the diversity of cultural solutions to a common human problem. More recently, however, anthropologists have shifted their attention to death itself, not simply its aftermath. This has happened because modern medical technology has transformed both dying and death, making them problems to be managed. Newer studies examine the consequences of this shift, using the same ethnographic methods developed in the tradition of field research in exotic locales.

Managed dying is, to a large degree, a matter of timing. Medieval Europeans were familiar with that: Theological tracts called *ars moriendi* used to guide the dying toward a ritually tamed good death. Modern medicine ties dying with life extension technologies. Two critical technologies are mechanical ventilators, derived from the iron lungs

of the 1940s and intensive care units (ICUs), first established in hospitals in the 1950s. Shortly after the introduction of ventilators and ICUs, sociologists and anthropologists began to notice what they called social death, a prolonged liminal state where the dying are neither fully alive nor explicitly dead. They hover in a twilight zone made possible by aggressive medial intervention. When medical staff and visitors speak about the patient in the latter's presence as though he or she is not there, social death is the reality of that moment. It is a peculiarly modern condition defined by the moral ambiguities surrounding aggressive intervention. What, for example, is specifically diagnostic of life, or of death? When is a full technological press to maintain life appropriate? When is it too much? Once started, when should it be stopped and, if so, on whose authority? These are not only questions of law, medical ethics, and hospital policy but also bedside realities for anxious family members having to make difficult choices.

How laypersons react to these challenges is one area of anthropological interest. A hospital, like any corporate community, has a distinctive culture in which visiting laypersons are outsiders to whom much that happens is invisible or incomprehensible. Visitors may not know that treatment for dying patients is more to stabilize than to cure, that prognostication is something doctors avoid or smother with generalizations, and that some physicians are more willing to use all available technology than are others. Nor are ideals such as patient autonomy and informed consent easy to apply. Life is sometimes prolonged even when there are medical doubts about the helpfulness of doing so or when families are in conflict (not uncommon) over what to do next. One anthropologist has described hospital end-of-life care as a zone of indistinction abounding in ambiguities that undermine hopes of a good death or a death with dignity. None of this is intentional; it simply flows from the logic of great medical capability and complex institutional arrangements for managing the barely manageable.

Resolving these untidy matters is normally done in quiet consultations in hallways or doctors' offices. Occasionally they break into public view, where they arouse controversy and passions. That is because medical technology and timing have made possible a new life form: individuals in a persistent vegetative state, maintained by machines and pharmaceuticals. Theirs is the ultimate social death. The numbers are growing, and individuals in such a state challenge conventional beliefs about moral personhood and the role of divine authority at the end of life.

One such individual was Theresa (Terri) Schiavo, whose headstone reads "Departed This Earth February 25, 1990, At Peace March 31, 2005." For 15 years Schiavo's body was a site of political, legal, and religious theater on which the ambiguities of timed dying were played out: her uncertain intent and lack of autonomy in deciding on care; legal challenges as to who could properly make clinical decisions for her; questions as to whether a recognizable self or personality still resided in a socially dead body; acceptable language for her condition, the term *vegetative* thought demeaning by some; and fears that in withdrawing life support, the judgment of flawed mortals is substituted for divine intent. These are not only medical and legal matters but cultural and theological ones too. Because hospitals are where most Americans die, they are the prime venues for competing, contentious views about what is to be done at the end of life and how it is best timed.

A related decision and one usually easier to make is organ donation, the "gift of life." Gift giving is an old interest in anthropology, associated with earlier research on social and economic organization in traditional, kinship-based societies. Organ donation is comparable to exchange in prestate systems in that it is nonmonetary, gifts are anthropomorphized by their association with the giver, and their circulation is part of a moral economy rather than one based on cash. In such systems, no gift is ever unencumbered and purely altruistic. Receivers are under obligation to reciprocate in some way, preferably in the future rather than immediately, making them debtors beholden for the long term to givers.

These themes are evident in modern organ donation as well. The gift of an organ is sometimes fetishized, recipients believing they have inherited behavioral features of their donor (of whom they know little or nothing). These have included newly acquired food preferences and aesthetic tastes in music or art. Some wonder if the donor was morally upright, even criminal, putting them at risk of acting out antisocial proclivities. Others express a desperate need to know all they can about the

donor and the circumstances of death. They want to reciprocate, to "give something back" by doing good works in the name of the deceased. But others are less troubled, adopting the larger culture's view of the body as a kind of machine and their new kidney an "off the shelf" replacement. Organs are utilities, spare parts; this idea fits well with the consumer orientation of American life. In this regard, anthropologists have studied the busy international traffic in organs, and some have voiced ethical objections to the exploitation of donors in poorer countries on behalf of well-to-do recipients in the developed world.

An additional area of current anthropological interest is memory and memorialization. Conventionally, memory is psychological recall, a private experience in the mind. In anthropology, however, it is useful to think of it as something social as well, "memory as moral practice," an insight originating in ethnographic work on suffering in Madagascar. Memory in this model is a narrative recreation that draws its imagery (and hence its veracity) from selected and edited details of past experience. It is put forward, as one anthropologist has said, as a point of view of "back then" from the vantage point of now and of subsequent, intervening lived experience. Memory so understood is a species of storytelling that, as a moral practice, is both artful and strategic. Obituaries, eulogies, and the storylines of Internet memorials or "virtual cemeteries" are examples.

A popular if minor literary genre, obituaries are teaching devices presenting the life of the deceased in reference to contemporary standards of value and worth. (Obituaries for the notorious do this also, representing their subjects as negative exemplars.) For example, newspaper obituaries in the 1800s were most often written for white, propertied men, their endeavors the more valued, and for women if they were associated with important men. Women were typically described in terms of their domesticity, charity, and Christian virtue, whereas men were described in terms of their military, political, or business prominence. The text was florid, with appreciative editorial asides; verbal artistry by the writer was expected and necessary. An obituary was a well-told morality tale. Obituaries now, however, create a memory line according to a very different aesthetic. They read like a job résumé: place of birth, educational and military experience, marriage and offspring, business and professional accomplishments, and, for women whose careers were in the home, their domestic and voluntary interests. Hobbies and late-life travel come near the end of a matter-of-factly rendered life history, followed by brief, conventional references to the sadness of survivors. Private ruminations, of course, are more nuanced but, like an obituary, they replay a storyline that is highly selective and built around an aesthetic appropriate to a time and place. Memory as moral practice gives shape to the past (aside from what actually happened); helps justify action and judgments in the present; and affirms that, in recall, the dead are still with us and can never be completely gone.

The various topics reviewed here do not exhaust the ways anthropologists study death, but they suggest the range of interests. A topic for future research, oddly overlooked so far, is ethnic and cultural diversity in end-of-life care. Some important beginnings have been made, but they tend to be abbreviated case studies with little in the way of cultural context. More than that will be needed. Anthropologists will undoubtedly respond with full-scale, nuanced studies comparable to those of earlier ethnographers.

Death, Clinical Perspectives

The clinical perspective of death involves the person, as a whole, dying. From the perspective of physiology there are many ways to die, and there are many physiological ways to describe the death of a body. But any discussion of the clinical perspective of death should never be limited to these physiological aspects of death because the clinician is concerned with persons, not merely with bodies.

Many variables affect the manifestation and progression of death in different people. From the clinical perspective there are many ways in which, even without the pursuit of "cure" physicians and other caregivers attend to a person as dying progresses—maintaining their integrity as a person, their intimate relationships, the viability of attainable goals, and the maximum joy with minimal suffering each day, and toward the end, each hour. To adequately respond in this way, it is useful to know particulars about the person who is dying. The fears that often attend the process of dying can lead to great suffering. These fears can be of many different types. The clinician, who must understand the physiological aspects of the dying process and who must be able to manage the physical symptoms that can afflict a person who is dying, must also pay attention to the particularities of an individual person's experience of dying, including their fears and their hopes for whatever time remains. This is not the same as discussing issues of pain medicine dosing, survival data, and other quantitative information. And yet, awareness of a patient's fears can drastically change the way the clinician weighs the many options available for intervention and the way he or she presents the options.

In addition to this, often people die in the context of families who will affect the person's experience of death and who will be left standing by the bedside after the patient has died. Long-term medical care typically involves a small set of people—often only the patient and a spouse, friend, or parent. But at the time of death, many who are important to the patient will arrive at the bedside. The work a patient and a close friend have done over time to get ready for death may not have been done by extended family and friends. In such crucial hours questions may arise from new arrivals that seem not to mesh well with the clinician's experience of the patient and the most intimate associates. And yet, the clinician must remember that the extended family and friends, whatever their views, play a role in the patient's experience of life and death that simply cannot be fathomed in a short period of time. These aspects of the end of life are important in fully understanding the clinical perspectives of death. But again, for many clinicians, they are the hardest to fully understand, especially as they are not always emphasized in the education of clinicians.

A Three-Step Process Perspective on Dying

There are three steps that a clinician can take to gain a fuller, more adequate perspective when caring for a dying patient. The three steps are relationship, negotiation, and the establishment of a plan.

Relationship

The first step, relationship, involves three important aspects. The initial aspect is understanding the illness experience. Until we understand the details of a particular person's experience of dying and of being ill, it is impossible to respond to the full reality of the unique experience that particular person is having. Even the physiological aspects of death cannot be responded to adequately until we understand the special experience of that person. Central to understanding the illness experience is listening, which can be difficult when a patient is suffering or dying. The most useful listening often involves things as simple as allowing the patient to suggest what they perceive to be of most benefit to them in the context of their illness experience. In the current atmosphere of medicine, this subjective element in decision making does not always fit more common criteria for decision making—your appendix is inflamed, so it ought to come out; you have pneumonia, so you ought to have an antibiotic; you have a curable cancer, so you ought to have chemotherapy; and sometimes, you have an incurable cancer, but you ought to have chemotherapy because we give chemotherapy to people who have cancer. However, at the end of life, the most important elements do not fit into the same category as appendicitis, pneumonia, and cancer. What the suffering person says about his or her

suffering is itself the instrument for determining the best course of action—every bit as much as a blood culture is the proper instrument for determining the cause of bacteremia and the proper antibiotic for the disease.

The second aspect of the relationship step is sharing relevant information. To make good decisions about particular lives—whether it is the decision of an ill person, that of a spouse, or that of a parent for a child—adequate information is necessary. This information may include such things as the nature of the disease from which a patient is dying, the likely course and timing of a death, and the processes in place in the clinic or hospital for managing patients who are dying. However, many people who are dying do not want to know the details of their disease, the timing of their disease, the likely manner of death, or even the inevitability of their death. Indeed, for some people, ignoring the inevitable seems to be part of their quality of life during their final days. This can be culturally based (in cultures as diverse as that of Brazil and that of Japan, the reality of fatal illness is often not revealed to the ill). But within any culture, irrespective of "cultural norms," there are people who do not wish to know the details of their fatal illness. There is no moral imperative for ensuring that everyone who dies does so knowing the cause of their impending death, nor even that they are dying. There is, however, a likely moral imperative for the clinician to make sure he or she knows to whom he or she is talking as far as possible, because this knowledge can make available windows of opportunity for the dying that might otherwise be missed. Unfortunately, sometimes clinicians stay silent about death because of their own discomfort. Responding to dying patients is indeed among the hardest aspects of being a clinician.

A third aspect of the relationship stage is a global needs assessment from which it is recognized that the needs of people who face of death vary widely. Some will tolerate much more pain than others in exchange for mental lucidity. Others will have fear of pain as their primary source of anxiety. Some will be profoundly affected by fatigue, others by depression, others by concern over their appearance as they become cachectic or edematous. Global needs assessment is a process of asking questions and of listening without presumption of what a particular person's needs may be. Stating needs can be difficult, especially for patients who have long been self-sufficient. Finding the language to characterize the needs is difficult—suffering at the end of life often has the character of vagueness, despite being deeply important to the experience of well-being.

Negotiation

The second step in comprehensive care of a dying patient is the step of negotiation, which also involves three aspects. First is a discussion of the prognosis. Again, the amount of information shared regarding prognosis may depend upon the person's own expressed desire to know, as well as factors such as culture and family wishes. But culture and family wishes should never determine, a priori or presumptively, how much the patient wants to know about prognosis. Only the individual can reveal explicitly or through hints and suggestions how much he or she wishes to know about prognosis. Another important point is that patients are often interested not only in the prognosis regarding the likelihood they can be cured, but also in the likelihood that in the face of incurable disease their suffering will be controlled, or that the disease can be slowed sufficiently to enable them to experience additional good days, weeks, or months. This latter aspect of "prognosis" for a dying patient can have implications that are more immediately pressing than any other, for this aspect provides the dying person a measure by which they can determine what they might hope for and what they might concretely achieve. The window of opportunity for such hope and achievement is often so limited at the end of life that the clinician should feel an urgency about determining what the patient wishes to know in terms of prognosis.

The second aspect of the negotiation stage concerns goals. At each juncture in the process of dying, whether long or short, when an intervention or decision is being considered, it is vital that it be considered in light of some goal—whether the goal concerns some aspect of suffering, a physical act to be accomplished, or reconciliation or forgiveness. Discussion about goals disciplines and focuses decision making in any clinical arena, but especially in the clinical arena of the dying person. Without discussion of goals, unnecessarily burdensome interventions can be made that truncate

possibilities for achieving goals. Here, as in every other domain of the decision-making process, one cannot presume what goals may look like for people who are dying. It is easy enough in the clinical arena to presume that goals would be related to things achievable by medicine. However, the obligation of clinical medicine is to remain open to surprise by an individual patient's perspective and wishes.

The third aspect of negotiation, after discussing prognosis and goals, is the consideration of options. The good clinician will be as prepared as possible to offer options in the face of goals and prognosis. This is a matter of training and conscientious attention to advances made that might benefit the patient. At the same time, the good clinician will acknowledge when he or she is not certain of the options. In such a case, the clinician can offer enormous benefit to the patient and the family by being an honest guide in the search for options that fit the patient's goals set in light of the patient's prognosis. Humility in the face of uncertainty is one hallmark of the great clinician in the arena of death, and it can lead to deep and abiding benefit for a patient and family.

Establishing a Plan

The third step in developing a comprehensive approach to the dying patient is establishment of a plan. Having become acquainted with a particular person's understanding of the illness experience and of his or her needs and having discussed relevant information (including information about prognosis and information about the patient's goals and options for moving forward), both the medical plan and the life plan will come together in a comprehensive plan. This comprehensive plan is always susceptible to change as either goals or prognosis or options change. Indeed, the fact that a plan can change if a patient's status changes can be a source of deep and meaningful hope for a person in the middle of suffering. Many experienced clinicians have seen enough unexpected improvements at what was thought to be the end of life that this openness to surprise is neither unreasonable nor deceptive. But the value of a comprehensive plan in the clinical setting is that windows of opportunity for achieving goals are not lost on the presumption that medical interventions are most beneficial to a person.

The Patient–Clinician Relationship

One important reason for the flexibility of the comprehensive plan is the fact that there is often uncertainty in the period surrounding death. This uncertainty about death is something shared by both the patient and the physician, and this fact is often not explicit in the relationship between clinician and patient. Nonetheless, it is an important aspect of the reality of the patient–clinician relationship at the end of a patient's life, whether or not it is acknowledged.

Though decisions are often made in the face of uncertainty, those made at the end of life are sometimes more uncertain than others. But certain types of healing are uniquely possible in this setting. Here, relationships are crucial.

The healing aspects of a physician who is willing to stay with the patient, to listen, and to make available options that help the patient to achieve goals in the final stage of life cannot be underestimated. This relationship between the doctor and the person is one of the most important aspects of the clinical perspective on death. A part of it is simply being with someone who is experienced with people who are dying. For the clinician, the temptation is to run away and distance oneself, or else to move so close that the experience becomes an authentic experience of "the death of a person" but thereby becomes so intense (especially if repeated) that the situation is not sustainable in a way that allows the clinician to maintain a healthy perspective. This leads to suffering on the part of the clinician that can evolve into burnout, eventual emotional coldness for the sake of protection, or unhealthy behaviors that offer escape through addiction, broken relationships, or suicide.

Responding to Questions

Another important aspect of the relationship between clinician and patient is simply being with someone who is willing to live with uncertainty and to ask questions such as, "When are you actually dying?" in a society that tends to hide the realities of death. When does the dying process start? This is not merely a question of physiology. Dying is a process that precedes death. But only death fully accomplished has a clear demarcation. The process of dying is a gray area, one that

evolves, one that can simply dawn upon one over time. And here is another aspect of the clinician's role in helping the person toward death: There is much that can be done to ease the burden of symptoms and to restore function so that the active process of dying is still in the future. This is not an effort to avoid death but rather an effort to treat persons who are experiencing the illness of dying. Though death cannot be stopped, the illness of dying can often be treated in such a way as to alleviate many of the aspects of suffering associated with death.

The Caregiver Team

Another important aspect of the clinical perspective on death is it involves more than the patient who is dying. A person's death is profoundly affected by the presence or absence of family members, both for better and for worse, depending upon the particular circumstances. But in these cases, the role of the medical caregiver is special because the medical caregiver attends the death, attends the person who is dying. One important aspect of this attending is restoring relationships as far as possible. The centerpiece of the clinical management and response to a person who is dying is relationship. The clinician's relationship to the patient and the relationship of the patient to other members of the care team are all centered upon treating the illness of dying, reducing the burden of symptoms, and facilitating the renewal and the ongoing integrity of a person's relationship with those around him or her. This aspect of relationship is central to the clinical perspective on dying, and even medical interventions such as the relief of the burden of symptoms and the restoration of function are performed with the goal of maintaining the integrity of relationships.

Effect on the Clinician

One last but no less important aspect of the clinical perspective on death is the effect of death on the clinician as a person. If the relationship of the clinician to the patient is central in this clinical perspective, the fact that the clinician is a person is central as well. Because the clinician attends hundreds or thousands of deaths in a career, he or she will change over time. Over time, he or she will gain facility, nerve, calmness, knowledge, capacity, and the ability to function with confidence while the dying person will have a singular experience, namely, their own death. The clinician's relationship with dying patients will be affected profoundly by how they negotiate their own experience of mortality. This aspect of clinical perspectives on death and dying is one that is insufficiently discussed in contemporary medical education.

Summation

In summary, the clinical perspective on death has no single descriptor but is as fluid and responsive as the range of people who die. Pathophysiology will be affected by the social, cultural, spiritual, and family aspects of the dying process. The dying process itself will be influenced by many of these factors, and the start of the dying process may be different from one person to another despite the apparently identical physiological processes. The clinician who is privileged to attend persons at the time of their dying must pay attention not only to the physiological realities at hand but also to other potential sources of suffering, and he or she must help to make explicit the goals, options, and opportunities at hand. Central to the clinical perspective on death is relationship; this includes the relationship of the clinician to the patient and also the ways in which the mature clinician can facilitate and enable the patient's relationships with those around him or her. In addition, the clinician armed with knowledge of such things as interventions to reduce the burden of symptoms can, in many cases, effect healing even when cure is not possible. Healing can occur even in the middle of the dying process. There are many things that can be done to maintain the integrity of relationships and the wholeness of the dying person, and when death is more clearly certain and imminent, the clinician does well to provide this opportunity to a dying person. The goal of the full clinical perspective on death is to put at the service of persons the wealth of possibilities in medical science with the aim of wholeness, integrity, and fullness of relationship. When a person dies, it is crucial for the clinician to remember that there are people left at the bedside, including family members and friends, as well as staff, some of whom may be

profoundly affected by seeing death for the first time, others of whom need to be reminded that no death is just a death but that every death is a singular event. The grief and bereavement of all people involved are among the most important aspects of the clinical perspective on death.

Death, Humanistic Perspectives

Death is a biological phenomenon: All living organisms die. Biology, medicine, and other disciplines examine death scientifically. However, death is also a human phenomenon investigated by the human sciences, such as cultural anthropology, history, religious studies, and literary theory, as well as social sciences, such as sociology or sociopsychology. Philosophical perspectives on death constitute an important class of these humanistic perspectives.

This entry discusses the humanistic perspectives on death by drawing attention to the difference between *naturalistic* and *humanistic* approaches to human nature in general, and to death as a key aspect of human existence. First, this contrast is described in broad terms. The humanistic perspectives on death are then divided into three: *essentialist*, *existentialist*, and *culturalist*. The distinctions between these are based on general philosophical anthropology (the philosophical study of human nature), providing helpful categorizations across the humanistic disciplines. Another subdivision is the one between *empirical* and *conceptual* approaches to death. It is the task of philosophers to contribute to conceptual investigations of death and mortality, while others in the human sciences explore these issues on empirical grounds.

Humanistic and Naturalistic Perspectives

Naturalist accounts of human existence, including death, emphasize that human beings are natural creatures among other animals. They are not essentially different from other organisms, although their skills and capacities exceed those of animals. Naturalism arises from the advancement of the sciences in the modern age. From a scientific perspective, human beings occupy their distinctive place in the world simply as natural beings. They do not have any special "task" or purpose (*telos*) beyond itself. Scientists observe human life and death from an objective, third-person point of view, describing and explaining facts about how people live and die. Death, then, is not essentially different from, or more mysterious than, any other natural phenomenon. It is part of nature. If it is natural to live, it is natural to die. Science can describe and explain all the facts about death and dying that are explainable.

According to naturalism, there is no immortal soul (or its equivalents, as conceptualized in different religious traditions). There is nothing to seriously qualify as the subject that could survive death; the very idea of survival, immortality, must be rejected as unscientific. Death is the final, irreversible cessation of the processes of life. This kind of naturalism, or materialism, is the paradigm not only of science but of recent analytic philosophy of death, defining the context within which it is examined, for instance, whether or not death is bad for the one who dies—a question originally discussed by the ancient atomist Epicurus and his followers, especially Lucretius. (Yet, there are also analytic philosophers, such as Richard Swinburne, who defend dualistic and Christian ideas of immortality.)

From a more humanistic perspective, however, a reductive naturalist picture of humanity, including death and the experience of death, remains unsatisfying. For most people, death is something "more"—more mysterious and terrifying—than ordinary natural phenomena. Even those who deny the existence of supernatural beings (such as deities) or survival after death may find the naturalist perspective on death too restrictive. One need not adopt pseudoscientific beliefs about any "afterlife" in order to maintain that a natural-scientific treatment of human mortality is insufficient.

Humanistic perspectives on death receive part of their motivation from the inadequacy of the purely scientific perspective, which, despite its enormous significance for understanding death as a biological event, fails to appreciate its human significance.

Whereas biologists and other natural scientists investigate death as the natural termination of life processes, researchers in disciplines like cultural anthropology or history may examine how death has been conceptualized in different cultures. Literary theorists and critics, as well as art historians and others in the human sciences studying art, may discuss the depictions of death in literature, the fine arts, and the cinema. Such perspectives on death focus on what death or mortality—or beliefs about immortality—mean or have meant for people, instead of describing and explaining mere natural facts.

Three Humanistic Perspectives

Humanistic perspectives on death may be classified in terms of the underlying conceptions of humanity they assume. When applied to death and mortality, this philosophical anthropology turns into philosophical thanatology, which, as a philosophical subdiscipline, amounts to a largely nonempirical inquiry into mortality and its significance for life. Such an approach to death is distinguished from empirical inquiries seeking answers to factual, explanatory questions, whether natural-scientific or historical and social-scientific. Philosophical thanatologists may also study death in a general conceptual way not restricted to humans. The meaning of the concept of death may be distinguished from the observable criteria of death. It is one thing to determine whether an organism is dead; it is another thing to say what its being dead amounts to. Such conceptual problems may have an influence on how philosophers and social theorists think about such concrete cases as the ethics of abortion or euthanasia.

One should also distinguish between death as a state (being dead) and death as the event of an entity's entering that state. Moreover, death and dying must be distinguished: One may not fear death (being dead), because if death is the end of experiencing, there is nothing to fear, as nothing harmful can be experienced if there are no experiences; yet, one may fear the possibly painful process of dying, the process irreversibly leading to the state of death. This process itself calls for conceptual clarification. It would be misleading to identify it with life, although all living beings, with natural necessity, die, and their entire lives could be seen as processes inevitably leading to their deaths.

In addition to these conceptual distinctions, three major humanistic perspectives on death may be distinguished: (1) essentialism, (2) existentialism, and (3) culturalism. These will first be described in general terms and then applied to death.

Essentialism

Essentialists attempt to reveal an immutable essence of humanity, the necessary and sufficient ("essential") properties that make human beings humans, separating them from the rest of the world. Plato, Aristotle, and classical Christian thinkers were essentialists. The human essence, "human nature" in the essentialist sense, is *normative:* It not only describes what kind of beings humans are but also prescribes them to be as fully human as they can, to fulfill their essence. The essence of humanity is not simply a matter of facts but also a matter of what humans ought to be, as elements of a cosmic, normatively structured "world order." Naturalists argue that there is no such "order" at all but only the natural, factual world order. From a scientific perspective, human beings' place in the world among other natural entities is not normatively distinguished. The kind of objective normativity defining human nature in an Aristotelian or Christian essentialist fashion lacks scientific justification. Thus, naturalism, as described here, abandons essentialism.

Existentialism

Existentialism is another way of "negating" essentialism's search for a universal human nature. Instead of "factualizing" (with naturalism) the normative order that essentialists regard as objective, existentialists deny that human beings are bound by *any* such order, natural or normative. Existentialists do not claim that people are free to breach the laws of nature, but they argue that the subject is radically free to (re)interpret his or her own situation. According to Jean-Paul Sartre, in particular, the subject finds itself "thrown into the

world" amid natural and political contingencies, especially the absurdity of death, but in this situation it is precisely up to himself or herself to create meaning in life. No prior order, either normative or factual, constrains the subject's constructions. There is no essence—no timeless image—of what human beings inherently are. The world itself, just like the subjective life thrown into it, is objectively absurd; the individual is responsible for creating any significance life might have. Celebrating the autonomy and responsibility of the subject, existentialism opposes the naturalistic tendency to see people as ultimately mere bits of matter. Sartre also opposes the essentialists' urge for an essence prior to individual existence. There are major divergences between Sartrean atheist existentialism and Christian forms of existentialism (e.g., that of Paul Tillich or Gabriel Marcel), but the emphasis on the significance of individual existential situations unites these different views.

Culturalism

Culturalism can be seen as a synthesis of all the other types of philosophical anthropology. According to culturalists, human existence is irreducibly cultural and sociohistorical. People live within a normative cultural framework constitutive of their humanity. Culturalists sympathize with the essentialist search for normative characteristics of human nature, but they have learned from naturalism and existentialism that this search cannot be satisfied in its traditional form. It is, however, difficult to follow naturalism to the reduction of human beings to mere material objects, or existentialism to the affirmation that humans are free without limits and that no basic characteristics of humanity—no prior normative order—is needed. Avoiding these extremes, culturalists affirm that people live within a normative order constructed (and reconstructed) by human beings themselves—not as individuals but as sociocultural beings within their practices. No ready-made, cosmic, normative structure sets a model to how human life should be led in order to qualify as human; nor can humans live without any such normative order. Rather, the human world is a cultural world.

Applying these three general perspectives to death and mortality, the following humanistic perspectives emerge:

Essentialist accounts of death, especially Christianity and other religious views on humanity, traditionally postulate an immortal soul or spirit, though not all religious defenses of immortality are essentialist, and not all forms of essentialism postulate an immortal soul. Even though the body is destroyed in death, the person's essence, the immortal soul, will live on. The conceptual basis of such a view is something like Cartesian mind–body dualism. Alternatively, if the inseparability of body and soul is emphasized, as in traditional Christianity, one may claim that the entire person will be resurrected on the "last day." For Plato, in contrast, the essence of humanity was the supersensible reason. In any case, it is the immaterial, immortal soul—however it is conceived in detail—the highest "level" of a person, that is taken to be in touch with the normative world order central to essentialist theories. Whether a person deserves salvation depends on the moral quality of his or her life.

Existentialist views, more strongly than others, emphasize the significance of mortality for understanding human existence in general. This is famously captured in Martin Heidegger's notion of "being-toward-death" (*Sein-zum-Tode*) and the related pursuit of authenticity (with its roots in earlier protoexistentialists, including Søren Kierkegaard). Existentialists focus on the individual, personal nature of death: One can only live one's own life and face one's own death. The full acknowledgment of this is the only route to authenticity. If one refuses to acknowledge the deeply individual nature of one's mortality, one is leading the life of what Heidegger called *das Man*, the anonymous, inauthentic subject. Existentialism, in its Heideggerian form, also maintains that only human beings *can* die. Only humans are mortals, whereas other living beings just perish, cease to exist; their mode of being is not "being-toward-death." Death, existentialistically viewed, is closely related to the absurdity of life and the world as a whole. Death itself is the ultimate absurdity, to the extent that an individual may, like the person described in Tolstoy's *The Death of Ivan Ilyich*, be unable to accept the fact of his or her own death.

Culturalists understand death and mortality (and the possible search for immortality, often in religious contexts) as sociocultural phenomena, describable, explainable, and understandable from

the standpoint of empirical anthropological and/or cultural-historical studies on the significance of death and related rituals in various cultures and historical epochs. Philosophically, culturalism thematizes mortality as part of the "order" people create and (re)structure, as part of their symbolically articulated self-understanding of their lives as mortal—a self-understanding that is, in most cultures to some extent, religiously manifested and transmitted. Living in the "human world," human beings live a mortal life. This is part of the cultural normative framework they set for themselves; natural-scientific investigations of death, though abstracted from specific cultural contexts, are parts of this same cultural framework. Culturalists need not claim that the fact that humans die is "culturally relative" (in an implausible factual, empirical sense), as if there were exotic cultures whose members were immortal. Rather, culturalists view mortality as a biologically based phenomenon that needs to be received and interpreted in all cultures recognizable as human. In this sense, it resembles other deep features of life, such as birth, parenthood, or sexuality.

These applications of different conceptions of human nature to mortality are hardly ever represented in pure forms. There is enormous variation in the ways in which philosophers and other scholars view death and mortality; the ideal types distinguished in this entry reflect only some of the basic differences among humanistic perspectives on death.

Open Issues and Challenges

To further enrich those perspectives, the following *challenges* to the humanistic understanding of death and mortality can be raised.

First, the subjective, individual, personal nature of death—the primacy, for any "I," of *my* death in comparison to anyone else's—cannot be overlooked. Humanistic reflections on death and dying ought to take seriously this inevitability of a first-person standpoint. The contrast between existentialism and culturalism—and the aspects of mortality they emphasize—is crucial here. It is a key existentialist point that only one's own death can be authentically faced. The question arises whether the existentialist, viewing death and mortality as "one's own business," irreducibly first-personal, can adequately acknowledge the mortal "Other." Because of its *solipsistic* tendencies, existentialist philosophical thanatology tends to be narrow, recognizing only one aspect of human mortality. If death is simply "one's own business," it is unclear how to decide, objectively, whether an individual succeeds or fails in authentically facing his or her mortality.

Secondly, immortality seems to be passé, given the overwhelming evidence there is for a (broadly) naturalistic picture of life and death. One of the few philosophical legitimations for this idea still taken seriously is Immanuel Kant's defense of the immortality of the soul as a "postulate of practical reason." Furthermore, one may ask whether immortality should be approached from a subjective (existentialist) or culturalist perspective, given that essentialist accounts of survival are nonstarters. If the hope for and the possibility of immortality are reduced to facts about how these problems are viewed in different cultures, philosophical thanatology will, however, be reduced to its empirical counterpart. Normative, especially ethical questions emerge, however, as soon as it is realized that immortality is not only a metaphysical problem about there being an immortal soul but also the moral problem of whether a certain kind of life, or (metaphorically) a certain kind of "soul," could be seen as "entitled to," say, the immortality some religions promise.

Thirdly, one may ask whether culturalism, either generally or in its thanatological applications, entails cultural relativism: Is there any objective truth, scientific or otherwise, about cultural phenomena or culturally interpreted natural phenomena (such as death)? Cultural relativism, as an apparently natural outcome of culturalist reflections on human existence as tied to culturally established normative frameworks, threatens to "refactualize" the normative order that culturalism sought to re-erect on the ruins of essentialism that the naturalist "factualization" of essentialism's original normative (cosmic) world order left. If the cultural framework structuring the "human world" people live in is just contingently established and maintained within a particular culture, it is hardly truly normatively binding. Culturalism threatens to collapse into naturalism, if naturalism is understood broadly as the replacement of a normative world order by a contingent, factual one. In

the case of mortality, the result is a replacement of the ethical issues about how to lead a mortal life by the factual question of how those issues have been articulated in various cultures or societies. Mortality as a personally serious problem will then be lost, philosophical thanatology abolished, and the humanistic perspectives on death impoverished.

Fourthly, death requires not only metaphysical, epistemological, or conceptual but also ethical attention. One might even suggest that human mortality is a topic whose metaphysical and ethical aspects are intimately, inseparably entangled with each other. It is impossible, for mortals, to inquire into the significance of the concept of mortality without taking an ethical stance to the question of what it is to lead a decent life as a mortal being with other mortals. There is no prior metaphysical question of what death "is" and no prior semantic question of what the relevant expressions mean. Rather, the ethical issue of how to face mortality is ipso facto a metaphysical one, expressing the full human meaning of mortality, "existentially" viewed. This suggestion is opposed to the orthodoxy of analytic philosophical thanatology, according to which the metaphysics of death must be settled first, before turning to ethical questions.

Finally, one might wonder how different philosophical and humanistic background ideas affect one's views on such special cases of death as abortion, euthanasia, murder, suicide, capital punishment, and war death. One general remark is in order. The point is not that one can, or should, first develop a general humanistic perspective on death and only then apply it to such cases. On the contrary, one's preunderstanding of these cases, as profoundly ethical situations of human death, inevitably contributes to one's ability to pose and respond to the metaphysical challenges that, conversely, contribute to one's understanding of the "cases" themselves. One might, for example, be convinced that murder is always wrong. With this moral conviction in place, one might go on to examine what one takes to be central philosophical or general humanistic questions about mortality. In such an examination, one's ethical convictions would not need to be bracketed; instead, one might bring all relevant factors into the holistic discussion of both factual and normative statements and hypotheses relevant to the phenomena examined.

A pluralistic account of the different humanistic perspectives yielding diverse philosophical issues about human death may offer more promising tools for investigating death and mortality than will standard conceptualizations, many of which are too narrow to deal with these issues in a manner adequate to their human complexity. Death has several aspects, manifested in the different perspectives from which it can be viewed. This is *not* to say that narrower conceptualizations, such as analytic arguments regarding the definition of death, are unimportant in their own contexts. Nor should the importance of empirical work within cultural anthropology, history, or medicine be underemphasized. However, human mortality is a holistic phenomenon, accommodating features from various humanistic fields, as emphasized in the different ideal types of philosophical anthropology. The relevant context for a humanistic reflection on death is not an imagined "context without context," a transcendent "God's-eye view," from which one should determine what death really is. To reflect on death from within human life, as partly defined by its mortality, is to reflect on the conditions that must be in place for such a reflection to be itself possible. Whatever one's particular humanistic (or naturalistic) perspective on death is, it is only in and through mortal life itself that one can examine this life with full seriousness.

Death, Line of Duty

By definition a line of duty death (LODD) occurs whenever a public safety officer dies while performing work-related functions, whether on or off duty. The term *public safety officer* includes sworn law enforcement, firefighters, and officially recognized public employees of a rescue or ambulance crew. Each death is a tragedy for the victim's family, friends, and coworkers, and each death is a public loss mourned by the community. The significance of their respective roles in the community was perhaps best demonstrated on September 11, 2001, when 72 police officers and 345 firefighters summoned to the New York City World Trade Center died while attempting rescue. This entry overviews LODD, describes its impact on survivors, and discusses the healing process.

LODD Overview

The first known law enforcement death occurred in New York City in 1792. Since that time more than 18,000 police officers have died while in the performance of public service. On average, a law enforcement officer is killed every 53 hours. In memory their names are engraved on the National Law Enforcement Officers Memorial in Washington, D.C. These public servants are honored each May during National Police Week with flags flown at half staff and a national memorial service on the lawn of the Capitol Building. Surviving family members and coworkers attend workshops during the week sponsored by Concerns of Police Survivors, a nonprofit survivor support organization founded in 1984.

An average of 105 U.S. firefighters die each year in the line of duty. They also are honored at an annual conference held in Emmitsburg, Maryland, home of the National Firefighters Monument. Plaques encircling the monument contain the names of over 3,000 men and women who have died while on duty since 1981. The National Fallen Firefighters Foundation created by Congress in 1992 offers a Survivors Network that provides resources and support to the families of these firefighters.

Impact on Survivors

Family, friends, and coworkers are traumatized by the unexpected violence that accompanies a line of duty death, and most often there is no chance to say good-bye. How survivors are notified of the death has a long-term impact on their grief. Thus, each death notification should be conducted in person (not on the phone), with more than one notifier present, and the information should be delivered in plain language and offered with compassion. It is critical that agencies create specific notification procedures and maintain accurate, up-to-date records of the next of kin. Unfortunately many agencies do not have these in place when tragedy strikes, and this can lead to inappropriate notification being made and confusion about how to assist survivors.

The grief and trauma that a line of duty death brings requires survivors to adapt to a new life as they learn what helps and what hinders their healing. Survivors of felonious death can suffer secondary injury when attending lengthy court proceedings, and in the end they may feel justice is not done. The word *closure* is sometimes used inappropriately to indicate an end of grieving; in reality, when a court case is completed, families do not experience an end to their grief. They now must redirect their energy toward developing a new life without their loved one.

Among surviving children, the grief process is especially long and protracted. These children often "numb out," sometimes to protect other family members. For most children, the real processing work of grief may be delayed as long as 5 to 10 years. In this area, C.O.P.S. (Concerns of Police Survivors) activities, sponsored on behalf of children, teens, and adult offspring of fallen officers, provide a safe place to allow feelings to surface and to interact with others who share the same type of loss.

It is common for survivors to feel overwhelmed and to experience fear related to diminished mental acuity and physical exhaustion. The severity of grief experienced is normal given the type of loss involved. Some survivors may contemplate suicide when they believe they are unable to cope with the many changes in their life and as they yearn to join their loved one in death. One study reported the most prevalent and acute symptoms of 126 law enforcement survivors who had been bereaved 10 to 15 years (see Table 1). Fifty-nine percent met the criteria for post-traumatic stress disorder (PTSD). A second study of 298 survivors conducted a decade later reported that 32% of the survivors met the same PTSD diagnostic criteria.

Survivor needs for support are wide-ranging, and survivors often look to their loved one's agency for help. Table 2 contrasts the progress agencies are making in providing support to survivors of loved ones killed in the line of duty. Both studies noted a significant connection between appropriate death notification with adequate ongoing support and how well survivors adapt to their loss.

Research also has identified myths that can have a negative impact on survivors. Survivors are often told that they will always be part of the law enforcement family. In reality, most agencies provide support only for a limited time. Survivors' needs for emotional support also may go unrecognized because of the unfounded institutional belief that knowing the risks involved in providing

Table 1 Most Prevalent and Acute Symptoms Identified by Survivors

Symptom	*Percentage Reporting*
Feeling lonely	75.2
Feeling unhappy or sad	70.4
Feeling low in energy or slowed down	68.3
Feeling easily annoyed or irritated	67.5
Feeling tense or keyed up	66.7
Easily hurt feelings	64.3
Trouble concentrating	56.3
Repeated images that won't leave your mind	53.9
Thinking about the same thing repeatedly	52.8
Trouble remembering things	52.4
Feeling emotionally numb or empty	52.4
Feeling angry	51.6
Wishing others would care for you	51.2
Difficulty falling asleep	50.8
Feeling uncomfortable in social situations	50.8
Feeling people will take advantage of you	50.8
Difficulty making decisions	47.6
Having to think carefully to make the correct decisions	46.8
Being angry at yourself for not accomplishing more	49.6

* Not questioned in 1987 study.

public safety somehow prepares families for the death of their loved one. In reality, no one is really prepared to lose a loved one. And while many survivors take comfort in a continuing relationship with their loved one's coworkers, some are prone to hold resentments against the former employer agency if their expectations for support are not met or if such support is suddenly withdrawn.

LODD Healing Process

Peer support is especially important in the healing process. Each year the C.O.P.S. survivor conference provides specific workshops and networking opportunities for survivors. C.O.P.S. also offers week-long retreats that allow survivors to discuss their grief and learn from others who experienced a similar loss. There are separate retreats for surviving widows, bereaved parents, siblings, teens, children, in-laws, significant others, and law enforcement coworkers. Surviving firefighter family members are provided similar services through the National Fallen Firefighters Foundation. LODD survivors also receive financial death benefits through the Public Safety Officers' Benefits Program, administered by the Department of Justice. Financial benefits are crucial for surviving families, but such benefits can also be the source of conflict among various family members.

Surviving coworkers experience grief and trauma at the same time they attempt to assist the surviving family members. Some coworkers eventually sever their contact with the family in order to continue their work-related functions. Coworkers may experience ongoing trauma symptoms and may not have access to or take advantage of psychological support. One study found that 70% of officers involved in a critical incident leave police work within 5 years of the episode. Thus, debriefing and appropriate counseling are essential for LODD coworkers, many of whom can be plagued by survivor guilt and self-blame. There is a need to validate and ventilate such feelings and confront one's own vulnerability in a safe, confidential environment.

Coworkers can develop symptoms of PTSD or be traumatized in ways that eventually affect their job performance and their home life. In general, public safety officers are action-oriented problem

solvers who resist admitting their symptoms, sometimes because they fear doing so will negatively affect their career. Others may feel that talking about their trauma is too painful or too passive. In reality, talking about the tragedy is taking appropriate action to work through the pain and integrate what happened with other aspects of their reality.

If given appropriate support for as long as it takes to absorb and adapt to the death, many LODD survivors eventually find they are not just healing, they also see ways in which they are growing. This does not mean they will ever forget their loved one or what happened; it means they have built up enough "scar tissue" that their symptoms are less intense and more manageable. One study of more than 1,000 law enforcement survivors, bereaved for an average of 9.7 years, explored posttraumatic growth. It reported a strong positive correlation between survivors who participated in C.O.P.S.-sponsored activities and levels of posttraumatic growth. Those survivors who learn from their experiences, such as being a successful single parent, developing public speaking skills, or volunteering to help others, were reported to find more meaning in life and experience lower levels of stress. As survivors work through their grief and trauma in positive ways, they know they are honoring and reflecting the values and courage of their loved one who was so dedicated to public service.

Death, Philosophical Perspectives

The history of Western philosophy is framed by bold assertions on the relationship between philosophy and death. In his dialogue *Phaedo,* for example, ancient Greek philosopher Plato famously defined philosophy itself as *meletē thanatou*, the practice or preparation for death, and the 20th-century philosopher and writer Albert Camus insists, equally famously in his *Myth of Sisyphus,* that the only serious philosophical question is the question of suicide. However, it was not until recently that professional philosophers began to address questions about death at any length. This entry treats only a few of the conceptual, metaphysical, and ethical issues concerning the philosophy of death and dying. These issues include philosophical problems regarding the definition of death, immortality, existential perspectives, and moral and ethical questions concerning death and the dead.

The Definition of Death

The most fundamental philosophical problem regarding death is how to define it. A common starting place is to warn against the ambiguity of the term: Death may refer either to the *process* of dying, the *event* of death, or the *state* of being dead. Rigorous philosophical work distinguishes in just what sense or senses the term is used. When philosophers speak of death, they are primarily denoting the event, the state, or both.

The next task is to provide the definition. Here philosophers distinguish a *definition* proper from a *criterion*. A definition tells us what death essentially is, what its necessary and sufficient conditions are; a criterion specifies a procedure for determining whether (and sometimes when) death, as defined, has occurred. A common biological definition of death for mammals identifies it with irreversible cessation of vital organismic functions. Philosophers wrestle with precisely which functions are meant. Traditionally, the permanent loss of respiratory and circulatory function was thought to equal death; today most philosophers prefer to define death as the permanent cessation of brain functioning, though they debate whether this means the whole brain, including the brain stem, or rather just the "higher brain," the parts that govern consciousness and thinking, particularly the cerebrum and cerebellum.

Conceptual problems related to biological death mainly concern whether the specified physiological functions are both necessary and sufficient for death. The irreversible cessation of the breathing and respiratory functions is arguably not *sufficient* for death, as some brain function may persist even after breathing and respiration have ceased, nor may it be *necessary* for death, as someone who lacks any and all brain activity but whose circulation and breathing are artificially sustained may plausibly be regarded as nevertheless dead. Similar problems relate to brain accounts. If cessation of higher brain activity is *sufficient* for death, this implies that someone in a coma or persistent vegetative state is dead, even when all other vital signs are normal, a conclusion most are unwilling to accept. Similarly, whole-brain death is apparently not *necessary* for death because trace amounts of brain activity does not qualify one as alive when all other vital processes come to an end. A related question concerns whether death is a threshold concept, that is, whether one may be *more* or *less* dead to the extent that the essential vital processes have deteriorated irreversibly or permanently ceased.

Further conceptual problems arise when the issue shifts from the nature of death in general to that of *human* death in particular. There is a general consensus about how human death can be biologically defined: A human is dead if and only if *either* all breathing and circulation have permanently ceased *or* all brain activity has permanently ceased. But can human death be defined in a purely biological way? Many philosophers follow our common intuitions that because human beings differ from most animals in their possession of rational agency, human death must be defined as involving a permanent loss of *self* or *personhood*. The philosophy of death thus connects with philosophy of personal identity.

Existential Perspectives

Much of the current philosophical interest in death can be traced back to the French and German existentialist philosophers of the pre– and post–World War years. The existentialists eschewed the abstract theorizing of the tradition and insisted on the analysis of human existence. One of their major concerns was with people's awareness of their own mortality and its role in their deciding how to live their lives. The foundational work is the German philosopher Martin Heidegger's *Being and Time* (1927). The work begins with what its author calls an "existential analysis" of *Dasein*—Heidegger's term for human worldly existence. One of the essential characteristics of *Dasein*, according to Heidegger, is "being-toward-death." Every person is aware of himself or herself as mortal, of his or her life as temporally limited. Heidegger was interested in the potential of this often tacit awareness to spur an individually authentic existence. For him, human existence is largely inauthentic, defined in large part by an immersion in the crowd, which Heidegger famously refers to as *das Man* ("the They," "the One"). We normally make our life choices in accordance with the expectations of others. If we think of death at all in this condition, we think of it as something far away, as an accident of sorts that befalls people in general, rather than as something specific and fraught with implications for the choices we make about how and what to be. But the anxious realization that our death is *always* a possibility and not just a remote one, that death as the "impossibility of all possibilities" is always final, and that our death is always "our own" and no one else's can keep us out of step with the crowd. With the lively awareness of death as our "own most possibility," one that "cannot be outstripped," our realization of the need to live and define ourselves on our own terms takes on greater urgency.

Heidegger's analysis of mortality was immediately influential on a generation of existentialist thinkers, both religious and secular. The existentialists by and large accepted Heidegger's view of death as the ultimate limit of existence—Jean-Paul Sartre, in his well-known *Being and Nothingness*, is a lucid example—and they agreed on how our awareness of our own being-toward-death may jolt us into a more authentic way of life, but they criticized Heidegger's account as overly individualistic.

More sympathetic with ethics than was Heidegger, later existentialists insisted on the importance of our relations with others in our decisions concerning how best to make use of our limited lifetimes. Simone de Beauvoir, in her account of her time with her dying mother in *A Very Easy Death,* as well as in her essay "Old Age," argues convincingly that one cannot even fully understand the reality and significance of mortality entirely from a first-person perspective. To appreciate fully your own finitude, you must see yourself from others' perspectives, including those who are close to you; you recognize *their* realization that *you* will not live indefinitely.

Immanuel Levinas, whose early work is also associated with existentialism, also brings mortality and relations with others together. According to Levinas, the primary significance of one's being conscious of one's finitude is ethical: A person experiences death as a limit on his or her mastery over existence, as constraining his or her freedom. The experience is preparatory for morality, because such self-limitation is precisely what is required for genuinely ethical relations with others.

Questions About Immortality

Matters concerning the definition of death have obvious implications for the question of whether people can somehow survive their deaths. If human death is defined as entailing the permanent loss of self or personhood, then personal immorality is seemingly precluded. In debating this issue, philosophers usually begin by distinguishing the mere survival of death from immorality proper. It is conceivable that something about us may survive the destruction of our bodies, but if what survives is merely, say, a shadow of our former selves or a ghostly image of our premortem bodies, this would not amount to personal immorality, strictly speaking. The latter involves forever retaining our full identities after death, and for that most philosophers agree that something like a soul is required.

The founding document of the pro-immortal soul position remains Plato's *Phaedo*. The dialogue documents the last conversation of Socrates with his disciples only hours before his execution. Not surprisingly, the topic turns to death. Socrates breaks with then-prevalent Greek accounts of the soul as a shadowy, quasi-material substance that resembles the living person in favor of the dualistic view of the soul as a simple immaterial substance that is not susceptible to dissolution. He argues that if one takes proper care of the soul during one's lifetime, by pursuing a philosophical life, thus pulling the soul away from the body and its attachments to physical satisfactions, then the soul will be freed from its bodily imprisonment at death—this is why philosophy is the "preparation" for death. For Plato, death is a blessing for those who live contemplative lives; nonphilosophers can only expect continual reincarnation, one bodily imprisonment after another.

Some contemporary philosophers also argue for human immortality. The majority who take up this issue believe that science has successfully demonstrated the dependence of the person on the brain, and they argue that the destruction of the latter entails the annihilation of the former. Consequently, most philosophers ask not about the reality of immorality but rather about the necessity of our hopes for immortality, the coherence of these hopes, and even the desirability of everlasting life. Even if humans necessarily long for immortality, could they find meaningful and fulfilling a life in which any desirable project can be put off indefinitely? Would not an endless existence be tedious? Might not death be a condition of the possibility of a meaningful life? These are major points of contention in the field.

The Harm of Death

It is widely thought that death, at least premature death, harms or is a misfortune for the one who dies. This position was challenged by the Hellenistic philosopher Epicurus. His enduring argument has two parts. First, Epicurus was a hedonist in the sense that he thought all good consists in pleasurable

sensations, all bad in painful sensations. Second, in opposition to Plato, who in the *Phaedo* advanced several arguments for the personal survival of death and the immortality of the soul, Epicurus insisted that the event of death effects the total annihilation of the self. Since at death one no longer exists, there is no subject to experience pleasure or pain, and hence death is neither a good nor an evil for the deceased. In stark contrast to Plato, Epicurus contended that death is nothing to us, no more to be feared than hoped for. The ancient Roman philosopher Lucretius, a follower of Epicurus, supplemented the latter's argument with his own so-called symmetry argument. Because we rationally do not regard our lack of existence before our births as bad, Lucretius reasons, it is irrational to look upon the state of death as bad, since the two nonexistences are indistinguishable. The merits of these and related arguments are hotly debated by philosophers today.

Critical responses to Epicurean arguments are manifold. Lurtetius is said to reason from a false premise that one's preexistence and postexistence are qualitatively the same. What differentiates these states most importantly is that the former is followed by existence and the latter follows existence, and this difference can justify different attitudes toward each. While it may make no sense to regret one's preexistence—because no one could really be born much earlier than he or she is without ceasing to be the same person and because preexistence doesn't indicate the end of all one's meaningful projects or living relations—it is natural to regret having to die precisely because we know that it brings these projects and relations to an end. Criticism of Epicurus's argument generally focuses on the hedonistic thesis that identifies good with pleasure and bad with pain. Most philosophers today reject not just hedonism but all doctrines that identify good or bad solely with subjective states. Instead, they endorse the view that certain things can benefit or harm someone even if he or she is unaware of them. That there is no self at or after death to experience anything, they argue, does not preclude our saying that the person has incurred a misfortune or harm.

On the assumption that a deceased person can be harmed by death or by posthumous events, philosophers are obliged to clarify just how this is possible. Some make use of "possible worlds" theory. Imagine two worlds: one, which happens to be the actual world, in which a particular person dies a premature death, and another nonactual but logically possible world, in which the same person lives well past life expectancy. With all other things being equal, are we not justified in judging the person worse off in the first world than in the second, and, if so, is it not true that that person is harmed by early death? Whereas some philosophers find such thought experiments fruitful, others reject the idea that such counterfactual reasoning can establish anything definitive about the harmfulness of death.

Another major issue is *when* a deceased person may incur harm. Putting aside the question of whether the event of death may harm a person, questions persist about posthumous events. To take a common example: Suppose that someone who strongly values a good reputation dies; afterward, that person's reputation is widely besmirched by malicious slander. It is tempting for many to say that the dead person is certainly harmed by the slander; the question is how this can be true given that the person no longer exists. One line of thought says that the harm is *concurrent* with the person's death: Even though the slander has yet to take place, the harm it inflicts *must* be concurrent with death if it is assumed that a nonexistent subject can be directly harmed. Another school of thought argues that the harm of posthumous events is *antemortem,* that it happens *before* the person dies. The idea is that because the person valued a good reputation while alive, it is the person's *living* self that actually incurs the harm of the posthumous slander. Still other possibilities abound: Perhaps the harm does occur but at no definite time. Such questions comprise what some call "the timing puzzle."

Moral and Ethical Matters

Philosophers are taking a growing interest in how questions about death relate to moral theory and applied ethics. A major controversy is what kind of moral consideration the deceased should be accorded. The question riddles diverse stances in moral theory. Utilitarianism, for instance, defines a morally right action as one that maximizes some good, say happiness or the satisfaction of interests. But whose happiness, or whose satisfaction,

is to be accounted for in making calculations? According to some, only currently living beings (humans certainly, perhaps other animals too) should be considered. Other philosophers wonder about people of future generations. The question carries over to the dead. Theorists contest whether the interests of the deceased—the question being whether the dead may have interests—get consideration in moral decision making. Similar questions apply to Kantian or respect-for-persons ethics, the major alternative to utilitarianism in moral theory. Central to this view is that any actions that fail to treat people as "ends-in-themselves" is wrong. To treat people as ends in themselves is to regard their moral agency as valuable and to refrain from treating them as mere instruments to be used for the purposes of others. A problem Kantians must address is whether the dead as well as living should be regarded as ends in themselves. The reality of death thus intersects with the fundamental issue of who qualifies as a member of the moral community.

Questions about the moral status of the dead pervade applied ethics as well. Ethicists debate, for instance, what constitutes respectful treatment of the dead. As with many areas of applied ethics, common practices in the sciences are called into question. Controversy surrounds the treatment of cadavers for medical research, the upsetting of burial remains for archaeological investigation, how to use or treat scientific or artistic work left by the deceased, and so forth. Such straightforwardly moral issues, together with the aforementioned work regarding the harmfulness of death, probably comprise most of the current philosophical literature on the topic.

Death, Psychological Perspectives

A variety of aspects of death impact daily life, influencing attitudes and feelings about death. Death deals with the meanings humans attach to it, their responses and reactions to loss, and the developmental aspects of death, that is, how death's salience varies across the life span. Indeed, humans are unique in that we anticipate death (our own as well as deaths of others), reflect upon how to live life, and consider how and when death will descend upon us. Embedded in a culture that is sometimes described as death denying, it is important to acknowledge feelings about death and dying, as these are influenced by both personal experiences and cultural aspects. Such experiences also impact those aspects of death to which humans are exposed.

The Meaning of Death

Both age-related and individual differences in awareness of death contribute to the meaning assigned to it. Variations in such meanings either enhance or suppress attention to death-related experiences, which may vary with age or with historical events that shape the nature of death itself and one's response to it.

For most individuals, death is the ultimate loss in our lives, whereas for others, death may mean punishment for one's sins. Death may also be seen as a transition between one form of existence and another. Indeed, there are as many idiosyncratic

meanings persons assign to death as there are people, though the tendency to personalize death is commonplace among children and older adults.

Responses to Death

Feelings about death, influenced by the meaning attributed to it, often determine the quality of life one has to live. In this context, one response to death or dying is termed *overcoming*. Overcomers see death as the enemy, as external in nature, or as a personal failure. Others show a participatory response to death, wherein death is internal, an opportunity to be reunited with a loved one, and is a natural consequence of having lived. Indeed, as people age and/or approach death, they become more participatory.

What life and death mean likely influences how persons respond to death. Although fear and anxiety are not the only responses to death, these have received considerable attention over the past decades. Whereas some might fear the losses accompanying death, others may fear the loss of control over their everyday lives. Recognizing such fears can enhance the quality of one's life, while ignoring them may lead to self-deception. In this respect, there are many manifestations of the need to deny, manipulate, distort, or camouflage death so that it is a less difficult threat with which to cope.

Many attempts to cope with death reflect the perception of death as something to be avoided, and recent historical shifts in our response to another's death and dying, the removal of death from our presence via a brief funeral, and the medicalization of death are both individual and cultural manifestations of this death denial. Indeed, assertions that an awareness of one's mortality initiates a midlife crisis, that persons first respond to the news of their own imminent death by denying its reality, as well as debates about the validity of near-death experiences have all normalized the construct of death denial among social scientists.

When considering fear and anxiety as responses to death, it is instructive to recognize that these constructs exist along a continuum. For this reason, it may be difficult to distinguish between normal and neurotic components of death anxiety, as they may be intermingled in most people. This continuum suggests that denying death is normal and consistent with the personal-cultural style described earlier as overcoming. Indeed, denial should be considered as adaptive to the extent that it is not overused, though there are certainly persons for whom its overuse is indeed pathological.

Grief and Bereavement: Individual Differences in Responses to Loss

The experience of bereavement is the reaction to the loss of a close relationship and is co-defined by grief (that is, the individual's feelings regarding the loss and mourning) and the culturally patterned expressions and rituals that accompany loss and allow others to recognize that a person is bereaved (e.g., wearing black). Normal grief reactions are somatic (disturbed sleep, loss of energy, diminished appetite, headaches, difficulty in breathing), behavioral (crying, withdrawal, overdependence, inability to perform daily tasks, disinterest in work, restlessness, expression of anger), and intrapsychic or emotional (shock, emotional numbness, sadness, fear, guilt, anger, loneliness, worry, anxiety, hopelessness).

Grief is best understood to include two components: an emotional reaction to losing a close attachment relationship and a need to cope with secondary stressors resulting from the death (disrupted finances, threats to family security, having to assume new family responsibilities). Although there are universal aspects of grief, the process of grief is an individual journey. For most persons, the work of grieving is a struggle between realization of loss and retention of the lost person, and it is clear that the supportive presence of others with whom the individual can share his or her grief is a key element in healthy grieving. Ultimately, the bereaved person is able to forge new relationships and take on a new postbereavement identity, wherein a new relationship to the deceased individual is formed.

Taking a goal-oriented approach, there are four basic tasks of grief: (1) acceptance of the reality of the loss, (2) working through the pain of grief, (3) adaptation to life without the deceased, and (4) engagement in new relationships. Recently however, this view of grieving has been challenged by one emphasizing the dual process model of coping with loss defined by responses to the loss of the relationship to the deceased individual (a loss orientation), where active grief work (e.g., a preoccupation with the death, heightened emotional

responses to the individual's absence) is emphasized, and responses to changes in one's lifestyle and relationships with others (a restoration orientation), which often coexist with a loss orientation. Over time, individuals shift from one orientation to another, depending on life circumstances, needs for social support, health, or requirements to learn new life or work skills. This dual process model asserts that there are indeed times when denial or avoidance of active grief work would be advantageous, and thus stresses the adaptability and flexibility of individuals' response to loss over time.

The symptomatology of grief can be complex and can involve a mix of potentially disruptive emotions (e.g., depression, anxiety, loneliness, and guilt), physiologic-somatic symptoms, disrupted everyday functions (e.g., disturbances in sleep and cognition, changes in self-regulation, immune functioning), diminished capacity to cope, and increased vulnerability to illness. In this respect, the distinction between normal and pathological grieving hinges upon the extent to which the loss of a valued relationship interferes with the older person's everyday functioning, work performance, relationships, emotional and cognitive status, and health. While these contradictory emotions complicate the distinction between normal and pathological grief, accepting such emotions seems to positively predict bereavement outcome. While social isolation undermines this distinction as well, and for most bereaved individuals, feelings of isolation and separateness from others are major obstacles to asking for and receiving help.

Maladaptive or pathological grief frequently involves a long-term change in the individual's typical behaviors, for example, in the form of chronic depression, extended denial of the death, self-abusive or self-destructive behavior, or isolation from others. In contrast, normal adaptive grief may or may not last for an extended time period (e.g., 2–3 years), depending upon a number of factors (personality, health, relationship with the deceased person, support from others). Although for many persons, grief follows a predictable course, adjustment to the loss of a loved one is nevertheless a complex process that changes (a) one's health and relationships with friends, family, and coworkers; (b) views about oneself; and (c) one's roles as community member and coworker.

Grief and Bereavement: Contextual Influences

As grieving is best conceived in terms of an individual in the context of relationships with others' experience, persons' responses to loss are influenced by a number of factors that affect the intensity and course of grief and mourning. These include relationship to the deceased, the nature of this relationship, the bereaved individual's history of loss, the availability of social support, the nature of death, one's cultural background, and personality of the bereaved person. These influences dictate the nature of grief (whether it is complicated or pathological), its intensity, and its duration.

These contextual parameters influence the experience of bereavement and interact with developmental differences in responses to death. For example, in later life, losing a spouse of many years can be especially disorganizing for older widow(er)s and may signal increasing dependency on others. For older adults, it is the loss of an adult child or a grandchild that is the most unforeseen, and indeed, older persons' own needs are often sacrificed in the service of meeting others' needs when such deaths occur, where older persons' grief is disenfranchised; the needs of younger persons may be put ahead of one's own needs to talk about the loss, leading to emotional isolation from others, who do not recognize the importance of being able to talk about one's feelings in the face of loss. For younger adults, the death of a spouse or child is likewise a nonnormative occurrence, that is, it is "off time," as is the death of a parent for a child. In such cases, the grief attached to death would be considered acute in nature and therefore more psychologically disruptive. Consequently, greater attention should be paid to providing social support as well as reinforcing a sense of personal safety and well-being in the face of loss for such persons. Similarly, if a son or a daughter had grandchildren, grandparents may have to raise these children and yet be faced with caring for themselves, wherein the grandparent's fears for the grandchild's welfare may emerge in view of the former's perceived imminent death.

Sudden or unexpected death via accidents, murder, suicide, or heart attack/stroke elicits more intense acute grief than a death for which the

family has had time to prepare emotionally; in the latter case, persons are said to experience anticipatory grief. When the trajectory of the illness is more predictable and elongated, grievers, although saddened at the death, at least have the opportunity to emotionally process the loss, as might be true for death by cancer, Alzheimer's disease, or AIDS.

Regardless of the cause of death, the process of dying, popularized by Kübler-Ross as a series of stages dying patients go through, disrupts relationships with parents, children, and spouses; interferes with one's future goals and plans; and often undermines one's sense of attractiveness and sexuality. Understandably, a terminal illness or a sudden death leaves family and friends feeling frustrated, angry, and lonely. Because death in childhood or young adulthood is nonnormative, individuals feel angry and cheated that the personal or career goals they have set for themselves are never going to be reached. If middle-aged or elderly persons have experienced the death of adult children or grandchildren, they must experience the sadness of not seeing them grow up, marry, and raise their own children.

Developmental Aspects of Death: Children and Adolescents

Children tend to grieve episodically, relying on repression and denial as coping mechanisms to keep their grief under cover, perhaps creating the illusion that the child is over the death of the parent. Indeed, it is not unusual for a very young child to have grief work to do for some time. Many surviving children who are considered "bad" may be in dire need of professional intervention. As grief is in part influenced by understanding of death, it is likely that children's awareness of death is largely a function of the interaction between developmental changes in the ability to think abstractly and the accumulation of death-related experiences. Indeed, there do appear to be at least semiregular developmental changes in the understanding of death, wherein children progress through three phases: (1) believing that death is not real, that the dead have lifelike properties (e.g., death is like sleep); (2) personalizing and/or externalizing death; and (3) understanding death as being internalized, universal, unavoidable, and irreversible. Despite these shifts, it is important to note that there are individual differences among children of a given age in their understanding and awareness of death. Death-related experiences help to account for such differences, as do individual differences in personality and the extent to which the family communicates openly about death. The deaths of grandparents, friends, heroes (sports figures, rock stars), and parents are powerful influences on children's awareness of death, as are culturally relevant experiences, for example, the Columbine High School shootings in 1999.

While it is clear that the death of a parent has a profound impact on children and adolescents, children often reexperience grief related to parental death as they mature. For example, for young children, a parent's death may signal the loss of safety, whereas for these same individuals as adolescents, struggles with one's identity may be influenced by the parent's death. To this extent, attempts by the child, in concert with those of the surviving parent, to "reconstruct" the deceased parent seem to be helpful. When a parent dies, adolescents often experience impaired school performance and disrupted, conflictual relationships with peers, and for some children and adolescents, the impact of such deaths can be far-reaching. Complicating matters is the fact that death has specific connotations for children depending on who dies (e.g., a pet, a parent, a friend, a grandparent). Likewise, some children may be unable or unwilling to let anyone know how they may be thinking about their own death or the deaths of others.

Adolescents' awareness of death is tied to the deaths of friends (e.g. suicides, accidents), parents, or grandparents and is intimately bound to their efforts to define themselves as unique individuals and to establish intimate relationships with others. Communication with other family members is disrupted. This is also the case when a sibling dies, though its impact varies by age. In each case, providing support and sameness in the face of loss is critical.

Developmental Aspects of Death: Adulthood and Later Life

In adulthood, responses to death are quite variable and yet have a quality of sameness about them. Indeed, in comparing younger and older

adults, older adults often experience a mix of physical, emotional, cognitive, and social consequences similar to those found among younger bereaved persons. Acknowledging individual variations, the pattern reflects an elevation of symptoms in the first months postloss and then gradually diminishing symptoms as the individual finds some success in adaptation.

For young adults, death comes, for the most part, unexpectedly. Rather than dying because of disease, when young adults die, it is often by accident or through violence. In most cases, however, death is due to homicides, auto or motorcycle accidents, or, in some cases, because of war. Understandably, though rare in young adulthood, a terminal illness or a sudden death leaves family and friends feeling frustrated, angry, and lonely. Because death in young adulthood is nonnormative, individuals feel angry and cheated that the personal or career goals they have set for themselves or others are never going to be reached. If they or their children die, there is the sadness of not seeing their children grow up, marry, and raise their own children.

Young adults who lose children through death, particularly if those children die at a relatively young age, grieve for long periods of time and experience great personal distress for as long as 5 years after the loss. Funerals may be avoided. Parents may assume that they are responsible, that they should have done something to prevent their child's death, and often they feel alone, angry, and resentful toward others and may be disappointed in one another. Some families seek professional help to assist them in working through their grief. For others, community support is very important. One such self-help group is The Compassionate Friends. In this context, parents whose children die grieve along two dynamic dimensions: personal functioning and relationship to the dead child. While both age of the child and a parent's age interact to dictate the impact of child loss, the death of a child requires a "lifelong accommodation" to the loss of a child.

For adults who are in their 40s and 50s, the possibility of their own death becomes real. Cancer, heart disease, stroke, and heart attacks are the major killers of middle-aged adults. For men, lung, colorectal, and prostate cancer become major concerns, whereas for women, lung, breast, and colorectal cancer are the most common. In this context, for individuals facing a terminal illness, reevaluating life and its meaning are likely consequences. The quality of one's relationships, as well as one's achievements and goals are assessed with a finality that was never present before. Plans for the future must be made. If the cancer is incurable, then the rights and obligations of the person as a dying individual come into play.

Death also affects middle-aged individuals through the loss of one or both parents. Because such deaths are often anticipated, adult children's grief may be disenfranchised. The circumstances (e.g., quality of life, living arrangement) often mediate the impact of a parent's death in adulthood. The fact that a parent is still alive serves as a psychological buffer against death. Stripped of this "protection," one must acknowledge that he or she is now the senior member of the family and that death is a certainty. Although children certainly mourn and grieve over the loss of their fathers, mothers may represent the last evidence of one's family of origin, as women typically outlive men. A parent's death symbolizes many things: one's own mortality, independence from authority, attachment, and love. A parent's death may coincide with personal, marital, or work crises; the loss of a parent may intensify a couple's marital difficulties.

Late adulthood is often equated with many losses, such as good health, relationships with others, and status in the community as independent and productive persons. Perhaps the most important losses thought to accompany getting older are those of one's spouse and, ultimately, the loss of one's own life. Older people are likely to have had more death experiences (parents, siblings, friends) than are younger people. This has several consequences: (a) The future seems more finite rather than being infinite, (b) older people may see themselves as less worthy because their future is more limited, (c) desirable roles are closed off to them, and (d) not knowing what to do with one's "bonus time" on earth, one may think that he or she has already "used up" what years were available. Lastly, as more friends and relatives die, older persons become more attuned to sadness and loneliness and to signals from their bodies that say that death is near. Death is further normalized in later life via its association with the age of integrity.

The principle of compensation may preserve a sense of continuity and fairness about life and death for some older persons, suggesting that older or terminally ill persons are compensated for the losses of health and ultimately life itself by the promise of eternity. This reinforces the practice of regressive intervention that there is nothing more that could have been done for the old person who is near death. Thus, we may expect the death of someone who is older, whereas we are caught off guard when someone young dies. Similarly, we may believe that younger persons have a more difficult time adjusting to the loss of a spouse than do older individuals.

It is indeed prudent to remind ourselves of the idiosyncratic nature of what death means to children and adults, as well as the variability across similar and different developmental transitions in response to such meanings. Each death is at once an individual, a familial, a community, and a cultural experience. Thus, death understanding is best thought of as something individuals construct and reconstruct, based on developmental life experiences and cultural shifts in the causes of and beliefs about death.

Death, Sociological Perspectives

Most sciences of the human condition—including history, social psychology, philosophy, anthropology, religion, political science, and sociology—address the problem of mortality. Many find it difficult to demarcate a sociology of death because the discipline's subject matter often overlaps that of others, as when studying the economic underpinnings of religious violence or the philosophical justifications of political pogroms. Further, often the practitioners do not perceive or frame their work explicitly in terms of a death and dying specialty. For instance, sociologists studying the epidemiology of cancer death rates of those living in proximity to military bases, sewage treatment centers, or coal energy plants may not identify their research in terms of a sociology of death and dying but rather classify their work as case studies in eco-racism. Finally, given the general absence of theoretically driven substantive research, some argue that there really isn't a sociology of death—or, if there is, it remains in some nascent state—and the field is defined more in terms of its subject matter rather than any overarching theoretical enterprise. Nevertheless, sociology provides distinctive perspectives to both broad- and small-scale death-related phenomena.

The Macroscopic Perspectives of Sociology

Among other things, the "sociological imagination" entails taking broad social perspectives in addition to those of individuals. From this vantage point, for instance, death can be seen as being socially functional as well as dysfunctional. In the *Structures of Scientific Revolutions,* Thomas Kuhn argues that major paradigm shifts in the natural sciences occur not because proponents of new ones convince or persuade the supporters of old ones, but rather because supporters of the old paradigms die off. Analogously, consider white Americans' responses to the question "Do you think there should be laws against marriages between blacks and whites?" In 1972, 39% of whites favored such laws; 30 years later, only 10% did. Of those born before 1900, 65% thought there should be laws prohibiting miscegenation

compared to only 7% of those born 1970 onward. Much of this change in attitude owes not to civil rights or affirmative action legislation but rather to the deaths of those holding antiquated racist views. Here detailed are several broad sociological perspectives of death's power to destroy, enhance, or otherwise alter the broad social fabric.

Death as a Measure of Life

Perhaps one of the discipline's earliest traditions has been to take death as a barometer by which to understand and measure the adequacy of social life. In *Suicide*, Émile Durkheim, one of the field's founding fathers, conceptualized acts of self-destruction resulting from either excessive or inadequate levels of social integration and regulation, initiating the enterprise of determining what social factors correlate with who dies, how, when, where, and why. For instance, sociologists studying inequality systems compare such measures as rates of infant mortality, life expectancies, and homicide between different social groups and how they change longitudinally. Progress can be inferred from actuarial change: Whereas in 1900, for instance, white males had a 43% greater life expectancy at birth than black males, by 2004 this advantage had declined to 8%. Societal regressions are also made evident: Russian life expectancies at birth in 2004 were less than they were 40 years earlier during the Khrushchev era. Cases of ethnic cleansings, suicide bombings, and assassinations are indicators of social disintegration.

The stratifications of life are symbolically dramatized by the stratifications of the dead, such as the racial, ethnic, religious, and class segregations between and within a community's cemeteries. In the Texas Hill Country can be found a "Republicans Only" cemetery. Obituaries, particularly those in the national media, are reaffirmations of the social registry of the élite.

Social Impacts of Changing Death Demographics

In 1900 an estimated 39% of newborn males and 43% of females could expect to survive until 65, compared to 78% of males and 86% of females born in 2002. A white American female at birth now has a greater chance of surviving to 65 than did her counterpart in 1870 have of seeing her first birthday. Such changes in the demography of death have had a profound impact on how lives are lived and deaths experienced. Also impacted are broad social dynamics. For instance, the two changes underlying the longevity revolution—specifically, the dramatic decline in infant and childhood mortality and life expectancy increases—dramatically alter societies' age compositions and therefore the various institutions (i.e., schools and the military) addressing the needs of (or reliance upon) different age groups. Modern societies now face such questions as how the aging of their populations affects the rate of social change, social expenditures for education as opposed to late-life medical care, military adventurism, or the pace of technological innovation. With old age replacing childhood as the most death-prone stage of the life cycle, cultural gerontophobia (fear of aging) has become interwoven with cultural thanatophobia (fear of dying).

Types of Societies and Differences in Their Views of Death and Death Fears

Sociologists overlap with their anthropology colleagues in conceptualizing how the entirety of a culture's death beliefs, symbolizations, and mortuary practices fit together. This sum of parts, called a culture's death system or death ethos, determines such widely ranging phenomena as a society's militancy, homicide rate, and use of capital punishment; its people's willingness to take risks or undergo abortions; their fears of or hopes for reincarnation and resurrection; their willingness to receive organ transplants or to purchase life insurance; and their preference for burial or cremation. So great is the power of this death system—this construction of meaning erected against the terror of death—that various social agencies seek to harness its energy as a method of social control. Specifically, this "harnessing" occurs through giving meaning to death's occurrence, by reminding individuals of their mortality, by assisting them in outliving their contemporaries, and by providing opportunities for its transcendence.

Death's Power to Enhance Social Solidarities

According to terror theory, based on the works of Ernest Becker, when awareness of death is

increased, in-group solidarity intensifies, outgroups become more despised, and people react more harshly toward moral transgressors and more favorably toward those who uphold their values. Death is a catalyst that, when put into contact with any cultural order, precipitates out the central beliefs and values of a people.

As evidenced by bullfights, gladiator contests, public executions, and both regime and antiregime funerals, death has the power to control attention and to induce cohesiveness among observers. Of all phenomena, death demands attention most, as its presence normally rips individuals out of their everyday automatic routines and forces them to think the unthinkable. Social institutions attempt to capture this power through ritual, which explains the near-universality of funerals and ritual sacrifices.

With increasing modernity and with death largely removed from everyday life, death's powers are often amplified in *Gesellschaft* societies. For instance, following the terrorist attacks of September 11, 2001, the sense of patriotism and unity in the United States had rarely been greater since World War II (with the possible exception of the funeral of slain President John F. Kennedy).

Mechanisms by Which Societies Limit the Disruptions Caused by Their Members' Deaths

Through funerary ritual, rules of inheritance, rules of succession, disengaging or depersonalizing those most likely to die, and simply hiding death (as in the Defense Department's banning of flag-draped coffins of casualties of the Iraq and Afghanistan wars), societies dampen the potential of their members' deaths to demoralize, instill fear, or otherwise disrupt social life.

The smaller the group or the greater the number of deaths, the more devastating these disruptive impacts can be. In *Gemeinschaft* societies, such as the small towns and rural cultures of the 19th century where people knew one another intimately, individuals often had unique, important, and irreplaceable functions. Their deaths could not be ignored; they had to be marked by community-wide outpourings of grief for genuine social losses and for collective reaffirmations of shared values so that the stricken group could reestablish and reintegrate itself.

As societies grow and evolve into increasingly differentiated and specialized complex structures, individuals become but interchangeable parts with such death-compensating mechanisms as rules for succession and mandatory retirement becoming institutionalized. It could be argued that the central accomplishment of modern societies has been to largely control untimely death—and to remove from everyday life as much death as possible.

The disruptive potential of death is, in part, a function of who dies, such as a political leader or religious visionary, and how the death itself affects the moral order. This moral order includes such experiences as sense of fairness, social pollution, and harm to social systems of trust and cooperation. Dead infants found in garbage dumpsters may produce large community funerals, whereas a deceased homeless man may become as invisible in death as he was in life. Disruptiveness is also a function of how death occurred and how able social organizations are to quickly respond. Floods, earthquakes, hurricanes, aircraft crashes, and other disasters causing considerable loss of life require extensive coordination of national, state, and local organizations and volunteers. Sociologists have long studied such situations, detailing how divisions of labor emerge to repair the rent in the social fabric. Also studied are the differences in social response to mass death—and the moral issues revealed. Why, for instance, were families of those killed in the terrorist attacks on the World Trade Center and Pentagon compensated $1.6 million on average whereas families of those killed in the terrorist bombing of the Alfred P. Murrah Federal Building in Oklahoma City received less than one-tenth that amount?

Death as Mechanism of Social Control

Whereas sociologists from the structural functionalist perspective tend to focus on the power of death to enhance social solidarities, those examining death from a conflict perspective are more likely to focus on the ways in which death and death fears have been used to oppress or otherwise control the thoughts and actions of individuals in order to consolidate the power of the ruling elite. Death fears and actual killings have long been mechanisms by which the ruling elite consolidated power. Mao Zedong (Mao Tse-tung) and Joseph Stalin allowed

tens of millions of their own people to starve to death in order to implement social change. The "honor killings" of female family members in some Islamic societies and the lynchings of black males in the American South were tactics to keep women and blacks in their place during times when both groups began questioning their unequal statuses. Another strategy to quell internal dissent has been to direct public focus on some life-threatening enemy, which invariably leads to the coalescing of support around the leader of one's group.

The historical ascendancy of the state as the most powerful social agency against death (and states' attempts to monopolize violence) has a host of implications. Political structures of power can be ultimately seen as collective efforts to control death and death fears, whether the threat be viruses, terrorists, pollution, or stray meteors. With modernization, most premature death occurs because of man-made (hence theoretically avoidable) causes. Concurrently, and not unrelatedly, modern political regimes became the social institutions providing the cultural rituals for death control and death transcendence. Eisenhower's military-industrial complex has evolved into the medical-military-industrial complex that has evolved as the skeletal structure of the social organism. Death beliefs and fears have become increasingly politicized, replacing their traditional religious counterparts as mechanisms of social control.

Mapping Institutional Influences on Cultural Death Systems

Social power concentrates in that institution best able to harness death's power. Such "harnessing" occurs through giving meaning to death's occurrence, by reminding individuals of their mortality, by assisting them in outliving their contemporaries, and by providing opportunities for its transcendence. Not surprisingly, battles for control over the rituals and ideologies of cultural death systems have arisen. For instance, conflict has arisen between religious authorities and funeral directors over the final rite of passage, including whether the ceremony's location is to be within the church or funeral home chapel, whether the casket is open or closed, and whether the clergy members or funeral directors are more qualified to act as grief counselors.

Among the greatest social controls ever devised by humanity to control its members' actions are the envisionments of various fates in the afterlife. Differing dramatically in terms of their desirability, religions harnessed their associated fears and hopes with elaborate belief systems that connected the quality of postdeath existence with the moral worthiness of the lives lived. Sociologists of religion have long studied the social distribution of beliefs in an afterlife, ascertaining why the increase in Americans' faith in the existence of life after death (which increases with education among Catholics and most Protestant denominations) and how that affects their social behaviors.

With secularization and the medicalization of death, cultural death fears are shifting from fears over postmortem fate to fears of the dying process. As a result, rituals for controlling death fears now change from prayers and moral lifestyles to obsessions over healthy lifestyles, featuring observances of diet and exercise regimens. This has led to the increasing economic power of the medical establishment and the political (and social) status of the medical elite.

According to the World Health Organization report of 2008, tobacco use killed 100 million people worldwide in the 20th century and could kill 1 billion people in the 21st century unless governments act immediately to dramatically reduce it. How did such usage rates come to be? The American government has long subsidized tobacco farmers, whose crops are key American exports to the global economy. During World War II, soldiers were issued cigarettes as part of their rations; until the 1990s, military commissaries sold deeply discounted cartons. Hollywood long glamorized and sexualized the practice. Social scientists, hired by tobacco companies, conducted focus groups with children to study ways in which children could be made into smokers. Why is it the responsibility of governments to ameliorate the problem?

With death largely removed from everyday life, thanatological lessons increasingly derive from the mass media, which exploit death's taboo status within death-denying cultures. Television's excessive use of death in news stories and program plots enhances viewership but possibly leads to desensitization and copycat behaviors. "Pornographic death," in which attractive female victims of homicide, suicide, and accidents are displayed, has also

been employed by advertisers to sell clothing, shoes, and perfumes. And to bring attention to their music, rock groups bear names such as Megadeath, Dead Kennedys, Grateful Dead, and Cannibal Corpse.

Memorialization, Collective Immortality, and Symbolic Immortality

Rituals for collectively remembering the dead also fall within the sociology of death and dying purview, whereby societies confer symbolic immortality to their elect in order to reaffirm core values and to provide the sacred sense of connection with past, present, and future generations. Sports, for instance, immortalize their elite through installation rituals in their halls of fame; sport teams ceremoniously retire their players' numbers. Religions engage in martyrology, creating monuments and holy days in remembrance of their founders and those having sacrificed their lives for the faith. Political regimes conduct similar rituals of remembrance with civil religion, conferring immortality with tombs for unknown warriors, statuaries, memorial days, and even postage stamps. Communist regimes, which battled religious legitimacy and proclaimed the finality of death, often embalmed their deceased leaders and put them on public display, as does the Catholic Church with its saints.

Conversely, regimes consign the memories of dissidents into political oblivion. Following the 1956 Hungarian revolt, the Moscow-controlled government in Budapest bulldozed the cemetery plots of the revolutionary leaders it hanged—including that of the former prime minister, Imre Nagy, who had urged democratization. Like the Roman Catholic and Orthodox churches, there can be intercessions on behalf of the deceased. In the 1970s, the U.S. Congress restored the citizenship rights of Robert E. Lee, and 18 years after his death, Nobel Prize–winning Boris Pasternak was posthumously reinstated into the Union of Soviet Writers.

The Microscopic Perspectives of Sociology

In addition to the macroscopic perspectives, sociologists have long studied death at the personal level, analyzing individuals' death-related beliefs (such as attitudes toward abortion, euthanasia, suicide, and capital punishment or beliefs in an afterlife), the social sources of their death fears, and the social status of (and interactions with) the dying and their caretakers, the dead and their survivors. People's ideas and fears of death are not innate but rather learned from their social and cultural environments. Dying is as much a social process as it is a biological or psychological one. In developed countries, death fears are increasingly acquired not so much through firsthand experiences as they are such secondhand sources as the media.

The Social Status and Experiences of Those Who Die or Are Most Likely to Die

To minimize the social disruptiveness occasioned by their deaths, the status of the dying (at least those normally perishing due to "natural causes") is often minimized, their full personhood denied. This is particularly true in modern death-denying cultures, in which AIDS victims and the elderly are stigmatized and must counteract others' tendencies to treat them as death lepers.

Medical sociologists have analyzed the interactions between the terminally ill and family members, clergy, and medical practitioners. Studies have consistently shown that physicians (who have been found to have inordinately high death fears when compared to other professionals and whose medical school training in dying is limited) often believe that the terminally ill do not want to know about the severity of their situation, that such information would destroy all hope and thereby accelerate death. A majority of patients, on the other hand, do wish to be told the truth and feel betrayed if the information is withheld. Glaser and Strauss modeled this as an informational game where, for instance, terminally ill patients know their fate but play along with the deceptions of medical staff and families and act as if all is well.

From military sociologists come studies of transforming civilians into warriors and later from warriors (i.e., those who have killed and have seen the war's carnage) back into civilians. The transitions are not easy. Soldiers are trained to kill and to be killed. Homicide rates have been found to increase following the conclusion of war but only within the victorious nations.

The Stigma Associated With Dealing With Death, the Dying, and the Dead

In India, the task of disposing of the dead is reserved for those at the bottom of the caste structure. In the West, particularly in England and the United States, the attempts of funeral directors and embalmers—whose members often come from the working class—to be recognized as professionals (perhaps as "grief experts" or funerary orchestrators) is a telling story. Among physicians, connections with the dying diminish one's status within the prestige hierarchy of the profession.

Those who must directly deal with death—such as medical pathologists, homicide detectives, forensic pathologists, animal slaughterers, death-row wardens, and hospice workers—are also subjects of sociological studies. These individuals have been found to distance themselves from their grim trades through viewing cadavers akin to the shells of cicadas and through using humor.

Grief, Bereavement, and the Social Status of Those Who Survive

With individualism and individuals' diminished connections with supportive communities, the brunt of death is borne by fewer and fewer people, whose loss is decreasingly public and must bear the burdens of loss alone. Symbols of mourning, such as the black mourning garbs of Victorian widows or the black arm bands worn by men, have largely disappeared. The period of mourners' exemption from social responsibilities has contracted significantly over the past century. Emily Post noted in 1927 a 3-year period for formal mourning; 5 decades later, Amy Vanderbilt recommended resuming normal life 1 week or so following the funeral. Legitimate grief and bereavement are not always socially recognized, compounding the emotions of loss. Issues of disenfranchised grief have emerged, such as with the loss of a life partner in a same-sex relation.

The burden of grief, like the care for the dying and traditional preparations of the dead, disproportionately falls on women. Their bereavement status in many preindustrial cultures often requires acts of self-mutilation, such as the severing of a finger or, in the extreme, the Indian practice of suttee, in which the widow is expected to sacrifice herself on the funeral pyre of her husband.

Legacy Work

No understanding of sociological insights into death and dying would be complete without including patterns of inheritance. The upper classes have long engaged in ways to be posthumously acknowledged, their names preserved with Roman numerals through progeny and adorning buildings, philanthropies, and foundations in support of various causes. With many elderly persons outliving their life savings, one traditional mechanism for assuring their assistance and care in advanced old age by family members is evaporating. Estate lawyers report growing desire of clientele to posthumously control the activities of the living through incentive trusts.

Death Anxiety

Long the focus of spiritual belief and philosophical conjecture, death and the attitudes of human beings toward it have become legitimate topics of psychological study since the middle of the 20th century. As ways of measuring death fear and anxiety have grown more sophisticated, and as the range of people studied has grown more diverse, researchers have produced a sizable scientific

literature on the causes, correlates, and consequences of death anxiety and related responses. Ultimately, this work has begun to yield practical implications for such contexts as death education for school children and professionals, medical and institutional care for the infirm, and even social criticism of mass movements, such as the response of large groups of people or political parties and governments to war or terrorism.

The study of death attitudes has a long past but a short history. Rooted in religious and philosophical systems that are as old as recorded human thought, the focused psychological study of attitudes toward death began only with the research of Herman Feifel in the 1950s, steadily gaining momentum thereafter. Reflecting the abiding themes of the "death awareness movement," early research focused on assessing fear of death and anxiety in relevant groups such as older adults and physicians, arguing that the discomfort reported by participants stemmed from a blend of individual factors (such as unconscious avoidance of personal mortality) and cultural attitudes (such as the American denial of death). Following the publication of Kübler-Ross's influential popular book, *On Death and Dying,* in 1969, research on death attitudes burgeoned, supported by publication of the first validated scales of death anxiety and related constructs. The result was a literature that became more methodologically sophisticated, more topically diverse, and ultimately more practical in its applications.

The Problem of Measurement

Early research on attitudes toward death used a patchwork of straightforward interviews; fantasy measures, such as asking participants to draw an image of death that was then rated for its positive or negative emotional tone; and projective tests, such as ambiguous death-related pictures to which participants would tell a story that could vary in its plot and theme. Among the most interesting of these methods were those that sought to assess perceptual defense by use of the Stroop color–word interference test, which flashed death- and nondeath-related words (such as *cancer* or *basket*) in different colors, with the instruction that the participant should quickly name the color; delay in doing so for the death-related words relative to the controls was taken as a measure of unconscious defense against the threatening perception of death, which could then be related to such factors as participants' gender, age, or medical status. Few of these variables, however, converged to yield coherent findings within or across studies, and few were carefully assessed for their reliability or validity in separate research.

By the mid-1970s research on death attitudes had increased in sophistication: Carefully constructed questionnaires were designed to assess global death anxiety, the threat that personal death posed to one's sense of identity as a living being, and the fears people reported concerning the state of death versus the process of dying as these centered on one's personal mortality versus loss of another. In the years that followed, instrument development continued, yielding reliable multidimensional measures of more subtle aspects of negative death attitudes, such as fears of premature death, concerns about bodily deterioration, anxiety about a protracted and painful dying, fears of nothingness or divine punishment, and worries regarding the impact of one's own death on loved ones. Finally, researchers began to recognize in their formal measures that death attitudes were not limited to a fearful preoccupation with mortality but also could include active behavioral avoidance, neutral acceptance of death as a part of life, and even active embracing of death as a form of surcease from a painful world or positive anticipation of an afterlife of reward. As a result, researchers are currently in a much better position to study how people actively process the reality of death in human life and relate it to other factors of theoretical or practical relevance.

Correlates of Death Anxiety

With the completion of literally thousands of studies of death anxiety in recent decades, some reliable trends have emerged in the findings, as well as many unanswered questions. Some findings are predictable: Professional groups that involve greater *risk* of death (such as firefighters or soldiers) tend to report greater death fear than do those who simply confront higher degrees of death *exposure* (such as physicians or funeral directors). Likewise, both physical and mental illness are associated with more anxiety about

personal mortality, and religious belief, though not necessarily religious behavior (such as attendance at services), often but not inevitably predicts higher death acceptance. In contrast, some findings are counterintuitive or largely unexplained. For example, older adults as a group are not more fearful of death than younger cohorts, despite their greater statistical proximity to death; if anything, death fears seem generally to peak in midlife. For whatever reason, women commonly acknowledge greater discomfort with death than men, a finding that tends to hold across ethnic and cross-cultural comparisons and that does not appear to be explained by a greater female penchant for emotional self-disclosure or a masculine concern with the social desirability of responses. Thus, more remains to be learned about even the more frequently replicated findings in the published literature.

Experimental Studies

Although correlational and group-comparison studies are informative, they are also limited in the sense that they cannot identify the causes of death attitudes, and they cannot reliably determine their effects. For example, knowing that psychiatric patients have a higher level of death anxiety than "normal" controls leaves open the explanation of this finding: Perhaps their fears of death contribute to their more general angst, as existential philosophers might suggest; perhaps their general anxiety simply "spills over" into worries about death and dying; or perhaps both general and death-specific anxiety are the result of other, more basic factors, such as attachment insecurity or problems in emotion regulation. To provide more definitive causal explanations for attitudes toward death, researchers need to conduct genuinely experimental studies that control some variables while manipulating or changing others and then carefully measure the effects. Two major lines of research on death attitudes have followed this strategy with useful, if sometimes disquieting, results.

The first is a long line of research by many investigators on death education, a diverse curriculum for grade school, high school, and college students as well as professionals, focusing on understanding the dying process, on cultural practices regarding death and bereavement, on demographic trends in dying and on a variety of specialized topics, such as suicide, problems of contemporary institutionalized dying, and stresses and skills in working in end-of-life settings or in grief therapy. In general, participants in such educational programs, relative to comparison groups, have developed a greater knowledge of death and dying, as one would logically expect. At an attitudinal level, however, results have been more mixed, with educational programs featuring primarily lectures and readings often *increasing* death-related anxieties, whereas those featuring experiential learning more commonly *decrease* such fears. It therefore seems that if one goal of such education is to allow people to approach death-related discussions and situations with greater equanimity, then ample opportunity should be provided for personal processing of the curriculum through subjective values exploration, group exercises, and reflective writing.

The second major experimental program of research concerns *terror management,* the psychological process by which people unconsciously moderate their fears of death through engaging in behaviors that boost their self-esteem or strengthen their identification with cultural worldviews that provide a kind of "buffer" against personal mortality. In a typical study participants first would be exposed to either a *mortality salience* manipulation, such as being asked to complete their own death certificate, watch a film on traffic fatalities, or read material that highlights the frailty or vulnerability of the human body, or be assigned a neutral task, such as describing their dormitory room. They would then immediately engage in an unrelated activity, such as responding to a series of mathematics problems, to distract them from consciously attending to their resulting feelings or thoughts. Finally, they would be assessed for the predicted attitudes or behaviors theorized to defend against death anxiety, such as more favorably evaluating their performance relative to that of others or adopting more conservative political positions. Results of terror management research have been consistently provocative, demonstrating that confrontation with death can drive a wide range of social attitudes and behaviors, from recommending harsher punishment for drug offenders to xenophobic avoidance of people who are culturally different, both of which indirectly reinforce mainstream

cultural beliefs at the expense of others. Moreover, some of the results are paradoxical: Young men whose self-esteem is reinforced by aggressive driving may actually drive more recklessly after exposure to a curriculum on motor vehicle accidents, and college students may be more prone to practice unprotected sex following a presentation on AIDS, as if to flaunt their personal invulnerability. Such findings obviously have practical implications for a wide range of social interventions and contexts, including death education. It also could have relevance for understanding broad societal responses to events like high-profile terrorism, which can precipitate massive shifts toward conservative social and political attitudes and associated behaviors, ranging from increased participation in religion to advocacy of military retribution against parties or nations perceived to be responsible.

The Practical Yield of Death Anxiety Research

Although some studies of death anxiety seem to have been conducted simply for the benefit of the investigator, contributing little of value to our understanding of the human encounter with death, other research programs have yielded conclusions of clear practical value. One example is research on attitudes toward older adults, which suggests that people—including the staff of nursing homes—who are insecure about their own deaths are especially prone to derogate and devalue the elderly. Furthermore, an ample line of research has examined the predictors of heightened fear of death among older adults themselves, demonstrating that greater anxieties characterize those who live in institutional settings, who are seriously ill, and who struggle unsuccessfully to achieve "ego integrity," that is, the sense that they have lived well, fully, and authentically. Similarly, research on hospice patients suggests that those who enjoy social support, who have recourse to spirituality in their daily lives, and who are troubled by few regrets about their pasts or their foreshortened futures are able to approach death with greater equanimity. Such findings carry implications for psychosocial interventions with such groups, suggesting the usefulness of opportunities for life review and the development of compassionate acceptance of self and others.

Future Directions

Although the great upsurge of interest in death anxiety associated with the 20th-century death awareness movement has begun to wane, it seems likely that research in this area will continue to make a consistent contribution to psychosocial theory and applications and that, in many respects, the scope of this research will continue to grow as it encompasses other populations. One illustration is the study of death attitudes of children and adolescents, which makes creative use of artistic and narrative methods (such as drawing pictures of death as a personified figure or writing paragraphs about personal meanings of death) that are then subjected to careful analysis to reveal developmental trends in boys versus girls. Another example concerns the increasing diversity of populations studied, which have extended far beyond the home base of this research in American college students to include health care workers, schoolchildren, and medical patients in a wide range of Eastern and Western nations, such as Israel, Sweden, Spain, Egypt, Kuwait, Australia, and China. Such work holds promise of clarifying trends in death attitudes that transcend a single culture, such as the tendency for death imagery to become less violent and concrete with greater maturity, as well as findings of particular relevance to a given culture, such as the identification of distinctive fears associated with bodily torture in the grave (e.g., among people in Islamic countries), or heightened separation concerns regarding the death of another (e.g., among ethnic Chinese). In summary, the study of death anxiety represents an abiding and increasingly sophisticated and practical field of research in thanatology, one that can be expected to continue for some time to come.

Death Awareness Movement

The death awareness movement refers to a somewhat amorphous yet interconnected network of individuals, organizations, and groups and includes scholars, advocates, and counselors. It encompasses self-help networks like The Compassionate Friends and professional associations such as the Association for Death Education and Counseling; the American Academy of Bereavement; the International Work Group on Dying, Death and Bereavement; and the National Hospice and Palliative Care Organization as well as their members, affiliations, and regional and state associations. Most hospices and palliative care units would identify with it, as would many funeral service organizations. Foundations such as the Hospice Foundation of America are involved as are varied institutes and interorganizational committees and task forces. Many larger organizations, with far broader and diffuse memberships and goals, may focus some attention on end-of-life issues and research or education on dying and death. For example, the American Psychological Association has a specialized task force on end-of-life issues. While the individuals involved may contribute to a variety of professional journals, there are a number of scholarly journals (e.g., *Omega, Death Studies,* and *Loss, Grief & Care*) as well as newsletters (e.g., *Journeys, Thanatos,* and *The Forum*) that focus exclusively on issues of dying, death, and loss.

In addition, the movement is international in scope. Many nations outside the United States and Canada have similar organizations. For example, the National Association for Loss and Grief serves Australia and New Zealand. The journal *Mortality* is published in the United Kingdom while *Grief Matters* hails from Australia.

The movement hosts teleconferences, symposia, conferences, workshops, and trainings and publishes a plethora of literature annually that ranges in audience from children to adults and from inspirational to self-help to serious clinical or scholarly work. This amorphous and far-reaching network—in reality a social movement—shares a common focus though not necessarily common goals, models, or methods. That focus is dying, death, and bereavement.

Roots of the Death Awareness Movement

The roots of the death awareness movement are diverse. Herman Feifel offered a seminar on death in the 1956 annual meeting of the American Psychological Association that later led to his landmark book, *The Meaning of Death*. Though there had been some significant theoretical and empirical studies prior to that work (by Sigmund Freud in 1917 and a generation later by E. Lindemann in 1944), Feifel's pioneering efforts are often regarded as the beginnings of a sustained academic study of death. The 1969 publication of Kübler-Ross's *On Death and Dying* increased public awareness of death. Throughout this period, a number of colleges began to develop and offer courses related to death and dying. These courses were housed in a number of different departments, including nursing, sociology, psychology, health education, or religious studies.

Death education continues to be consolidating. In addition to developing and offering courses, colleges and universities are now developing majors, certificates, and even master's degrees in grief counseling or thanatology. The Association of Death Education and Counseling has reinstated an earlier process for certifying death educators and grief counselors. Already, some members representing colleges and universities that have formalized programs have begun to discuss accreditation. These programs have been supplemented by academic centers such as the Center for Death Education and Research at the University of Wisconsin–La Crosse. Though this growth is impressive, recent events continue to suggest the tenuous nature of such

courses in the curriculum of universities and colleges. Many of these courses, programs, and centers are still tied to individuals rather than to departments or colleges. When a professor retires, the course or even the program may be retired as well.

In addition to this growth of academic thanatology, there has been a parallel growth in the period in the self-help movement. Since the early development of widow-to-widow groups, some groups such as The Compassionate Friends (a group for bereaved parents and siblings) have focused primarily on bereavement support, whereas others, such as Mothers Against Drunk Driving or Parents of Murdered Children, have included bereavement support along with other issues such as legal advocacy. Recent studies have emphasized that such support can be helpful to those both giving and receiving assistance.

The Development of Hospice

The major organizational effort in the death awareness movement is the development of hospice. That movement's remarkable history is well noted in other sources. It was, perhaps, one of the most successful grassroots movements in the last quarter of the 20th century. While the hospice movement has its roots in religious orders such as the Knights Hospitallers and the Sisters of Charity, both of whom focused on caring for the dying, Dame Cicely Saunders is generally credited with opening the first modern hospice, St. Christopher's, outside London in 1967. St. Christopher's tried to create a "homelike" atmosphere that sought a holistic, family-centered way to allow dying persons to live life as fully as possible, free from debilitating pain and incapacitating symptoms.

St. Christopher's became a beacon of research and practice, generating seeds that would grow throughout the world. Many of the pioneers who would influence the development of hospice and palliative care visited or trained there.

In the United States this resulted in the development of Hospice, Inc., outside of New Haven, Connecticut, in 1974. Branford, Connecticut, also had a small home care unit. But it was Dr. William Lamers, a founder of a hospice in Marin County, California, that viewed home care as both the heart and future of hospice. To Lamers, the idea of a homelike environment could best be offered within the patient's actual home. This home care model freed interested individuals from fundraising for new facilities and quickly spread throughout the country, sponsored by a range of groups from churches and interfaith groups to junior leagues. Hospice then took a very different cast in the United States, then in England, centering more on home care and heavily emphasizing psychosocial care and the use of volunteers.

The success of hospice was impressive. In 1974, the National Hospice Organization was formed. By 1978, there were over 1,200 hospices. In 1982, hospices could receive Medicare reimbursement. This proved a further spur to growth. There are now estimated to be over 3,000 hospice programs serving 700,000 persons annually.

The growth of hospice was a reaction to a number of trends. First, technology-driven medicine focused on cure, seemingly abandoning those who were no longer responsive to treatment. Second, hospice resonated with two other themes of the era—"consumerism" and "return to nature." Both trends converged on the idea that individuals could create alternative, more natural organizations, that they could take control of their lives—and their deaths. The study of death, especially the popularity of books like Kübler-Ross's 1969 *On Death and Dying* increased awareness of the unmet needs of the dying and bereaved.

Not everyone learned the same lesson at St. Christopher's. St. Christopher's impressed Dr. Balfour Mount, a Canadian physician; however, Mount was convinced that the lessons of St. Christopher's need not necessarily lead to a new form of care, but could be applied even in the high-technology environment of the modern hospital. When Mount returned to the Royal Victoria Hospital in Montreal, he pioneered the development of a hospital-based palliative care model. This model was further developed, and by the turn of the century the National Hospice Organization changed its name to the National Hospice and Palliative Care Organization to reflect these two different approaches, both centered on providing more humane care to the dying.

Current Status of the Death Awareness Movement

At present, the death awareness movement has become relatively institutionalized. This is evident

in a number of ways—many funeral homes now routinely offer "aftercare" services, ranging from informational and referral to educational seminars to sponsoring counselors and groups. Large-scale educational events are not uncommon: Bill Moyers's documentary series *On Your Own Terms* and Mitch Albom's book *Tuesdays With Morrie* (as well as the film adaptation) focused on death and dying and received widespread critical acclaim and public attention. Each year, the Hospice Foundation of America produces a major *Living With Grief* teleconference that reaches over 2,000 sites throughout North America and offers education to nearly 250,000 professionals. It is now routine, in situations of death and loss, to send crisis teams and grief counselors. In fact, President Clinton's response to the shooting of 12 students and 1 teacher by 2 classmates at Columbine High School in 1999 was to reassure the nation that he had dispatched grief counselors to the site.

In the mass media, dying and death are no longer taboo topics. News programs such as *60 Minutes* and *Dateline* frequently feature stories related to death and dying. At events such as the death of John F. Kennedy Jr. or in the aftermath of the September 11, 2001, attacks, it was not unusual to see in print and nonprint media grief and trauma experts discussing common reactions to the events and offering advice. The topic of death and dying has even appeared in the entertainment world, for example, in HBO's critically acclaimed *Six Feet Under,* a television series that took place in a funeral home and frequently showed expressions of grief, funerals, and corpses.

Reaction to the Death Awareness Movement

Naturally, such a movement has generated reaction. For example, in the aftermath of Columbine, there were a few critical pieces in the popular press that challenged the value of grief counseling. There has been a small reactive movement against death education in schools, spearheaded by anti-ERA activist Phyllis Schafly. R. Rosenbaum led a scathing attack in *Harper's*. To Rosenbaum the death awareness movement, led by Kübler-Ross, seeks to create a cult of the dead, romanticizing the process of dying and encouraging suicide. Rosenbaum's piece mixes serious cultural criticism with personal attacks on Kübler-Ross, who, at this juncture in her life, had begun to explore spiritualism. What Rosenbaum neglects to realize or to state was how distant the death awareness movement, at least within academia, had become from this former icon.

In essence, the contemporary criticism echoes an earlier, academic critique, labeling those as members of "the happy death movement" and accusing them of attempting to offer a positivist view of death that romanticizes dying and overemphasizes emotional expressiveness as therapy for the dying and bereaved. It might be stated that many of these reactions, while they do speak to some of the strains of popular thanatology, vastly oversimplify the many approaches and rich theoretical debate evident within the death awareness movement. In any case, the movement's place in academia, health care, self-help, and popular culture seems secure.

Factors Underlying the Development of the Death Awareness Movement

Beyond simply reviewing the chronology of the death awareness movement, it is interesting to speculate on some of the factors that influenced the easing of cultural taboos on death and the emergence of the death awareness movement. At least four major factors seem to be germane to this discussion.

The first factor involved changing demographic considerations. As the proportion and population of the elderly have increased, interest in the field of aging has intensified. With the study of aging has come an increased awareness and study of dying and death. The prolongation of death has created new strains for medical staff, new ethical issues, and new forms of care, all of which have served to increase public awareness of and interest in the discussion and organization of dying and death.

The second factor is historical. Many researchers have noted that the beginning of the nuclear age has created totally new issues that have complicated death and increased death anxiety. The latter half of the 20th century and beginning of the 21st have raised other issues. In this era, we have become aware of danger to the environment. We have the ever-present threat of worldwide

terrorism. We have seen the emergence of a new disease—AIDS—that has devastated communities in the Western world and continues to decimate Africa and threaten other developing areas. Faced as we are with the possibilities of the nuclear death of civilization, new diseases with environmental holocaust, and random terrorism, death has become a critical social concern. Support for this perspective can be found in the case of the late Middle Ages, when the widespread devastation caused by bubonic plague was reflected in a preoccupation with death, as evidenced by the art, religion, and popular thought of the time.

The third factor associated with the apparent rise in death awareness is sociological and social psychological in nature. The death awareness movement was aligned in goals with many of the social movements and trends of the 1960s. It asserted the rights and dignity of the dying. It proclaimed the naturalness of death. It denounced dehumanizing technology. It emphasized openness toward death and sharing with the dying. In short, its increasing popularity during the decade was aided by its identification with many social themes evident at that time.

The fourth factor is cultural. The death awareness movement filled a void in a secular society in which many segments of the population found no significance in the past's understandings of death within our culture in a manner that was more acceptable and thus more meaningful. In a society that is materialistic, death was avoided or denied. The death awareness movement then was part of a broad trend toward the inclusion of spirituality and meaning-making. That probably emerged as an increasing number of the baby boom generation contemplated the mortality of their parents as well as their own mortality.

Conclusion

This does not mean to suggest that the death awareness movement is merely a fad or a relic of the 1960s. While a number of factors combined in this era caused the movement to emerge and grow, it has demonstrated respectability and durability. It has become institutionalized. In fact, as members of the baby boom generation age, their own historical way of actively confronting the issues they face and compelling the larger society to face them suggests that they do.

Nor does it mean that the present forms will remain as they are. It will be interesting to see, for example, the ways that the growth of palliative care as well as other changes in U.S. health care will affect the future of hospice. Moreover, there are increasing calls to evaluate the effectiveness of grief counseling. There is danger that untested and unevaluated approaches that lack theoretical depth can do the movement great harm. Yet, even here, there are promising trends. As fields develop, there tends to be a consolidation of knowledge and a move toward certification.

One can predict in the next few decades an intensified interest in death and dying and increasing growth of the death awareness movement. Part of this is simply momentum. The development of large self-help networks, hospices, professional associations, and other organizational efforts, as well as the development of certification and educational programs in the area of death and dying, suggests continued focus. In short, interest breeds more interest.

Another part, though, is generational. The baby boom generation is now at the verge of moving into later life. As the baby boomers age, their own characteristic way of confronting the issues they face and compelling the larger society to do so suggest that death will continue to be a topic of interest well into the 21st century.

Deathbed Scene

Deathbed scenes are representations of the end of some person's life. The person may be real or fictional, and the presence of an actual bed is symbolic rather than necessary. What it reinforces when present is the comparatively extended nature of the death process. In this respect, deathbed scenes contrast with scenes of sudden death. In clear cases of sudden death, the dying person has no protracted opportunity to reflect upon his or her life. Deathbed scenes depict a more reflective process. The dying person must be awake and sufficiently in possession of their faculties to reason instructively about their predicament.

The most famous deathbed scene is set out in Plato's dialogue, the *Phaedo*. Faced with the prospect of his own demise, Plato depicts Socrates shunning any temptation to despair and maintaining a cheerful equanimity. His sends away his weeping wife and engages in an ultimately inconclusive but engaging dialogue concerning death and the likelihood of an afterlife. There is no fetishization of dying well as something apart from ordinary conduct. In the absence of any guarantees about the future, Socrates ends his life in a way that affirms its worth.

Socrates' deathbed scene has parallels in biblical and rabbinical literature, where a dying sage or patriarch gives a final parting lesson to his disciples. Occasionally there is an element of conflict and role reversal, with the dying man being instructed and set on the right path through dialogue with someone present at his death. This recurring theme of dying well and its association with the deathbed is present in a more structured and regulated way in late medieval and early modern Christian texts. As well as placing more formal requirements on the dying person (the *moriens*), there is a greater emphasis on the theme of conflict and being torn. The deathbed scene represents a time of crisis and struggle, as devils and angels vie for possession of the soul. The death of each person is to be, on a small scale, an *imitatio Christi* as the worldly and the spiritual are torn apart.

The earliest dedicated text in this Christian tradition was the *Ars Moriendi* (The Art of Dying), written by an unknown cleric and published around 1450 and frequently republished for 2 centuries thereafter. The text gives guidance on how to die well in the presumed absence of a guiding and counseling priest. The woodcuts accompanying the text depict contrasting temptations and inspirations that surround the *moriens*. The temptations are disbelief, despair, impatience with suffering, pride, and avarice. For every deathbed temptation, there is assistance available. The reader is offered hope rather than terrifying, *macabre* depictions of damnation.

What seems to be a departure from earlier, pre-Christian and pagan traditions is that suicide (which plays a part in both the death of Socrates and later in accounts of the death of the Roman philosopher Seneca) now seem to be ruled out, not so much as a rejection of despair, but as a rejection of impatience with suffering. Death is to be waited for with patience.

The impact of early modern Puritanism on this tradition of deathbed instructions involved a questioning of the efficacy of deathbed conversion and the pardoning of sins. A deathbed struggle for the soul presupposed a life that had been questionable

or straightforwardly sinful. But what need was there for a life of denial and constraint if the ledger books could be balanced with a few well-placed and sincere words at the end?

Questioning of the ars moriendi tradition also came from other, nonpuritan sources. In Shakespeare, the dying Falstaff is said to have mentioned sins and to have called out "God, God" but conspicuously made no ultimate confession and presumably won no final battle. The death of Othello similarly seems to play upon the limitations of the ars moriendi tradition. Othello dies badly, but his final failure is not that of succumbing to any of the temptations set out in the ars moriendi literature.

The last great exemplar of a tale of deathbed repentance concerned the notorious libertine, John Wilmot, the Earl of Rochester. In 1680 he is supposed to have issued instructions for full details of his faults and his ultimate repentance to be laid before the public. The credibility of this account of events has been questioned. In subsequent centuries accounts of the death of a succession of skeptics, free thinkers, and atheists, such as David Hume, Thomas Paine, and Charles Darwin, helped break the monopoly of penitent but orthodox Christians on dying well.

Although sentimentalized in Victorian literature and art (most notoriously by Dickens with the death of the character Little Nell in *The Old Curiosity Shop*), the deathbed scene remains influential in films and novels, even in news coverage and documentaries. A prominent example is the use of video diaries by dying patients to highlight some medical condition such as AIDS. In such cases the viewer gains only a fragmentary insight into the world of the dying. There is still the assumption that it is an occasion for a special kind of truthfulness. Occasionally, the ars moriendi tradition resurfaces in a straightforward manner, as it did in fragmentary media coverage of the apparently patient, nondespairing death of Pope John Paul II, who was afflicted with Parkinson's disease.

Death Care Industry

The death care industry consists of funeral homes, mortuaries, and other funeral providers who provide services for the dead as well as ways the living can honor the deceased. The death care industry around the world has evolved to serve the needs of the deceased and the bereaved, based on societal conditions, cultural proscriptions, and consumer demand.

Beginnings of the Modern Death Care Industry

The creation of the American funeral industry can be traced back to the circumstances of the American Civil War during which time transportation of the deceased back to his or her home without decomposition became very important. Methods to temporarily preserve the corpse were developed, although most Americans were not aware of these procedures and did not accept any "unnatural" intervention into the dead body's organic processes of decomposition. In time, the practice of embalming became more acceptable to Americans to ensure that they could have a last look at their lost loved ones with a pleasant appearance. These changes in the American funeral industry occurred as the end of the 19th century drew near. The industry gained economic power by the mid-20th century.

In other parts of the world, developments occurred along varying timetables. For example, the first Chinese funeral home was built by an

American in Shanghai around 1924. Chinese funeral homes began to spread in that area, as local apprentices learned the practice of embalming and knowledge about management from the owner of the American funeral home. After the Communist government came to power in China, all the funeral homes were taken over by and run by the government until the beginning of the 21st century. In developing countries like Taiwan, where there are both privately owned and government-owned facilities, the industry is no older than 30 years.

Prior to the development of the Chinese funeral industry, in 1880, the Japanese funeral companies originated in Tokyo, where they provided the service of lending funeral accessories to the bereaved and facilitating religious services for Shinto and Buddhist ceremonies, as well as arranging funerals and porters to carry the coffins. Since World War II, the Japanese funeral industry has developed along with other consumer services, following the economic development of the rest of the country.

The Death Care Industry Today

In the modern era, the death care industry is divided into three segments: (1) funeral (or memorial) services, which include pre-need planning and aftercare; (2) interment; and (3) grave memorialization. To adapt to societal changes and capture their share of the market, funeral directors have launched aggressive advertising campaigns; moved their operations into unconventional settings, such as shopping malls; and tried to shed their gloomy image using a variety of strategies, such as painting their hearses in colors other than black. Funeral directors have become more flexible, arranging services that accommodate personal choices, such as the scattering of ashes across lakes or mountains. Of all the changes in the funeral scene over the past decades, easily the most significant is the emergence of monopolies. Owners of funeral homes include individuals or families, local owners and smaller companies, corporations, and large chain companies in developed countries, such as Service Corporation International (SCI), which owns nearly 500 cemeteries. In contrast, in some developing countries like mainland China, the funeral industry is government supported.

Other than the consumer demands for more flexibility in funeral planning, the most significant societal factor to impact the death care industry in the United States recently is the country's declining death rate. This trend will change, however, due to the aging of the baby boom generation. A country's total industrial value of death care is determined by the number of people's deaths, its death rate, and the average cost of a funeral, burial, and monument. For instance, the death care industry provides more than 11 billion U.S. dollars in annual revenue and the average cost of a funeral service in 2004 was $6,500, according to the National Funeral Directors Association of the United States. But the cost of disposing of remains can range from far less to much more, depending on personal preferences and geographic context. For example, in China, annual revenue for the death care industry will be more than 30 billion U.S. dollars, and the average cost of a funeral service in 2006 was 360 U.S. dollars, according to the Statistics Bureau of China.

Standards of Practice and Oversight

Central to the ongoing development of the death care industry, including both the protection of the field and the protection of consumers, is the establishment of "learned societies" as well as national- and state-level regulations. The death care industry includes global, national, and local associations designed to best serve consumer needs and regulate the field.

Funeral Service Organizations, Associations, and Societies

The Society of Allied and Independent Funeral Directors exists to protect the interests of the smaller family funeral directing firms and their clients. There are many important funeral associations worldwide. The global association FIAT-IFTA (Fédération Internationale des Associations de Thanatoloques—International Federation of Thanatologists Associations) was founded in 1970 and is located in Monte Carlo, Principality of Monaco. The National Funeral Directors Association in the United States was established in 1882 and is the oldest and largest national funeral service organization in the world. The formal

name of the National Association of Funeral Directors in the United Kingdom was the British Institute of Undertakers, set up in 1898 by a group of funeral directors to "raise the status of the profession." The China Funeral Association, a national social organization of the funeral industry in China, was established in September 1989 and is engaged in funeral affairs under the leadership of the Ministry of Civil Affairs.

The objectives and purposes of these associations are as follows: (a) to research and jointly study issues relating to thanatological activities, especially with regard to services rendered in the memorialization and disposition of deceased individuals; (b) to promote international understanding and goodwill among funeral service professionals and to achieve uniform standards, rules, regulations, and treaties for the cost-efficient international repatriation of deceased individuals; (c) to encourage and develop education in the field of embalming, including establishing uniform standards and regulations; (d) to increase the level of professional knowledge of funeral service practitioners; and (e) to provide due respect and deference to the autonomy of national organizations and to avoid any interference in all matters pertaining to individual nations.

Funeral Service Education

Funeral service education aims to develop highly qualified funeral service professionals. The system in most countries includes schools, colleges, associations, and certification. To become a professional funeral director, a person has to attend a college or university program in funeral service or mortuary science education, pass the examination to get a certification, join a funeral directors association, and get certification credits. The program's courses includes coffin and casket manufacture, funeral operations, embalming, occupational health and safety, infection control, basic and advanced mortuary skills, restorative art, mortuary cosmetics, transfer procedures and guidelines, grief in the funeral workplace, ethical values for funeral service, funeral ceremonies, and laws about death. Certification credits are a new professional development requirement in the United States, to help funeral service professionals stay well-informed and up-to-date. The Academy of Professional Funeral Service Practice (APFSP) provides a voluntary certification program to funeral service practitioners. Credit is awarded in one of three categories: academic, professional funeral service, and civic. Members of APFSP are also allowed the opportunity to earn retroactive credit for activities in which they were involved from the date of licensure to the date of joining the academy.

The American Board of Funeral Service Education was founded in the 1940s and is recognized as the sole national accrediting agency for academic programs that prepare funeral service professionals by the U.S. Department of Education and the Council on Higher Education Accreditation. There are three other representative associations in the United States: the National Funeral Directors Association, the National Funeral Directors and Morticians Association, and the International Conference of Funeral Service Examining Boards.

Death Care Industry Sites of Service

The Funeral Home

Funeral homes provide many services for the consumer, including arranging all of the details for a memorial service and providing services after the funeral ceremony, which are often referred to as aftercare or grief support. Funeral home services normally include the funeral director's services, attending arrangements, a coffin suitable for cremation or burial, transfer of the deceased from the morgue to the funeral home, care of the deceased prior to the funeral, a hearse to the nearest crematorium or cemetery, the choice of day and time for the funeral to take place, embalming, viewing of the deceased, and provision of a car or limousine.

Funeral Director

After discussing customers' requirements, funeral directors will do many tasks, which can be grouped according to services prior to the funeral ceremony, during the funeral ceremony, and after the funeral ceremony.

The funeral director's duties include making arrangements for the funeral service, such as embalming, dressing, casketing, and cosmetics. Funeral directing and embalming are licensed separately by local jurisdictions. The job is also known as a mortician or undertaker: A mortician

is a person who works in a mortuary, and an undertaker was the name given to those who were able to undertake funerals as a part of their work in the United Kingdom. In modern times, the term *funeral director* is most commonly used for the person who performs all of these functions.

Pre-Need

During the 1980s, a method of funeral planning was developed, in which a funeral home helps relieve people's difficulties in making decisions at the time of death through planning their own funerals, designating their funeral preferences, and sometimes even paying for them in advance. This planning is called "pre-need funeral arrangements," "prepaid funeral agreements," or "pre-need." In this era, there is a greater willingness to take charge of one's own or a loved one's planning prior to death. It uses a similar process as an existing life insurance policy to pay for their funerals in advance. During the funeral planning, one is able to decide what type of funeral one will have, choose the specific items desired, write the will and estate planning, compare the prices offered by several funeral providers, and perhaps "lock in" today's funeral prices for the future, thus eliminating some of the stress that family members frequently experience.

To avoid the possible abuses of pre-need arrangements and to protect consumers who pay for their funerals in advance, regulations of pre-need funeral agreements between funeral directors and consumers have been developed. U.S. Congress enacted the Preneed Act of 1993 to strengthen existing laws. That means consumers should ask the funeral director for two things: (1) the Statement of Funeral Goods and Services, which details the goods and services the consumer is purchasing, for instance, what type of urn will be used for the burial, and (2) the Prepaid Agreement, which briefly describes the conditions and terms of the agreement, including the amount of money paid and any additional funds owed.

Disposal of Human Remains

Human remains are usually disposed of via burial or cremation. Burial is the act of placing a dead person in the ground and is also called *interment* or *inhumation*. The remains are buried so as to protect them, including hiding them from removal or tampering. Burial practices come from the human desire to show respect for the dead. Reasons for burial include respect for the physical remains, deemed necessary by the deceased's family and friends in many (but not all) cultures; an attempt to bring closure to lessen the pain of losing a loved one; and perhaps a necessary step for the deceased to reach the afterlife, in which case certain religions or customs prescribe a preferred or required method for disposing of the dead.

The World Health Organization declares that only corpses carrying an infectious disease require burial. After death, a corpse will start to decay and emit unpleasant odors due to gases released by bacterial decomposition. Burial prevents the living from having to see and smell the decomposing corpse, but it is not necessarily a public health requirement.

Humans are not always buried. Alternatives to burial include cremation, ash jump for skydivers, burial at sea, funerary cannibalism, ecological funeral, excarnation, gibbeting, hanging coffins, sky burial, and space burial. In most cases these alternatives are still intended to maintain respect for the dead, and some are intended to prolong the display of the remains.

In the cremation process, the deceased is burned in a crematorium. Most of the body is incinerated, leaving only pounds of bone fragments, which are processed into a fine powder called ashes, cremated remains, or cremains.

As opposed to traditional burial, cremation offers much more flexibility in dealing with the remains and has become a popular choice in Eastern countries such as in China and Japan, as well as in some Western countries. Cremation is now government required in mainland China. Options for the cremated remains include keeping the ashes in a container (called an urn) at home or at a temple, or scattering the ashes at a place of importance to the deceased, usually outside. Cremated remains can also be buried underground or in a columbarium niche. In the Eastern world, ashes may be interred into existing plots owned by the family.

For traditional burials, a coffin or a casket is used for placement of the corpse. This funerary box is used to both contain and display the remains of the deceased. A coffin may be buried in the ground directly, placed in a burial vault, or

cremated. The above-ground burial is in a mausoleum—generally a cement building at a cemetery that houses hundreds of bodies—or a small personal crypt.

Cemeteries

A cemetery is a place where dead bodies or cremated remains are buried. The term *cemetery* means "sleeping place," originating from the Greek word κοιμητήριον, which implies the land is specifically designated a burying ground. Cemeteries are places where the final ceremonies of death are observed in most of the world. However, these rites or ceremonies vary according to cultural practice and religious belief.

Memorializing the Deceased With Memorial Markers

When someone loses a loved one to death, a variety of reactions called grief are experienced. Funeral and burial traditions including a gravesite and a memorial marker serve the dual purpose of both memorializing the deceased as well as providing a vehicle for the expression of mourning by the bereaved.

Memorialization can be expressed through different modalities, such as putting a special headstone marker on the grave of the deceased, ordering a personalized funeral urn for the deceased, or planting or placing a memorial tree or stone.

Aftercare or Grief Support

Funeral home aftercare, grief support, or a continuing care program can be provided by a funeral home to maintain a helpful and caring relationship with clients, offering continuing services to the bereaved. Aftercare providers may provide aftercare programs that are staffed by skilled bereavement care providers. Most aftercare programs include some combination of individual counseling, grief support groups, a lending library, remembrance services, newsletters, community death education, and life planning seminars.

The death care industry is an evolving industry with similarities across international borders and unique regional features for the provision of services to both the deceased and the bereaved. This industry serves a vital function in helping humans show their ultimate respect for the value of life, which is in the manner in which it takes care of the deceased.

Death Care Industry, Economics of

The Standard Industrial Classification used by the U.S. Department of Labor describes the death care industry as "establishments primarily engaged in preparing the dead for burial, conducting funerals, and cremating the dead." There are approximately 22,000 funeral homes and 7,500 commercial cemeteries in the United States. However, the death care industry has a number of different components in addition to funeral homes and cemeteries, including monument makers, crematories, casket and urn manufacturers, producers of

memorial merchandise, pre-need sales, and cremation disposal operations. Furthermore, there are peripheral vendors that include funeral software designers, web technicians, insurance and trust companies, and marketing agencies, all of which support firms involved with direct contact with the dead and the bereaved. Oftentimes there is a great deal of overlap with regard to these different components. This is especially true for funeral service corporations, which typically offer economies of scope by offering a wide range of services and products.

Regulation of this industry varies from state to state, with the exception of the Funeral Rule. Under this mandate by the Federal Trade Commission, firms must make explicit particular pieces of information, such as an itemized price list. The mandate also prohibits certain claims, such as that embalming is required.

Financial Crises

Throughout most of its 150-year history, the death care industry legitimated its role in society contributing to the general social welfare. In the early stages of the industry's development, the protection of public health and sanitation was offered as justification for services and goods. Once restoration techniques and chemicals had sufficiently developed to transform the dead into aesthetically pleasing memory pictures, the industry expanded its role to include the facilitation of grief therapy. Beginning in the 1990s a series of events led to a crisis of capital accumulation for the death care industry that resulted in a shift in the way the industry framed its functions for society.

There are a number of contributing factors to this economic change. Jessica Mitford, who had originally written a scathing and widely read critique of the death care industry in 1963, died. Her passing, in combination with a release of a new edition of her book *The American Way of Death* in 1998, inspired many in the mainstream media to investigate cost issues and report on exploitative practices.

Another factor that contributed to the financial crisis during this time was the declining death rates. North Americans continued to live longer lives, and members of the baby boom generation (i.e., those born between 1946 and 1964) were only beginning to bury their parents. Because the annual number of U.S. deaths (between 2.3 and 2.4 million per year from 1993 to the present) and the number of U.S. funeral homes remained relatively stable (a little over 20,000), there were insufficient increases in customers to offset simultaneously increasing fixed and variable costs.

Finally, as was made famous by the popular HBO TV series *Six Feet Under,* the death care industry underwent a phase of increased mergers and acquisitions. Service Corporation International (SCI), for one, became international as it expanded into the Canadian, Australian, and European markets. However, as this acquisitive period progressed, corporations incurred a great deal of debt.

At least partially related to the rise in corporate consolidation was the increased negative publicity funeral practitioners began receiving. Federal Trade Commission investigations of market monopolies and allegations of mishandled bodies led many of these companies to significantly restructure their businesses and scale back expansion plans, if not completely divest themselves of individual firms. One such casualty was the Loewen Group, which had once been the second largest funeral provider in North America and the largest in Canada. In 2002, Loewen declared bankruptcy. It eventually reemerged as Alderwoods. However, Alderwoods was subsequently purchased by SCI in 2006.

New Directions

When revenues are tethered to the supply of dead bodies, an essential resource, those revenues are limited by the number of available dead bodies at any given time. Production was, for most of the industry's history, centered on the dead body. The value added and thus the profits reaped from practices such as embalming, restoration, cosmeticizing, burial containers, burial real estate, and floral arrangements necessitated this limited essential resource of dead bodies. As with other industries where access to an essential resource is limited by natural barriers, diversification of output takes on added importance. On the other hand, when revenue is tied to the consumer's ability to assemble one's own product, the capacity for value-added production is limitless since there can be any number of goods, services, or experiences that can be created to that end. The death

care industry manufactures the raw material and tools for a product by providing facilities, meeting rooms, media equipment, burial containers, and crematoria. Workers within funeral firms assist the consumer in the assemblage and packaging of those raw materials in order to create the end product, which includes the funeral service, mementos, and keepsakes.

In the mid-1990s, the death care industry began to lose its dependency on material and durable goods and began to increasingly incorporate "cultural" goods. Thus, funeral products could be mediated through the symbolic representations of consumers through the creation of goods and services like videos, memory boards, highly participatory funerals, and celebrations. Where once the industry placed its emphasis on its ability to provide embalming and therapeutic expertise, increasing emphasis is now being placed on providing the consumer with the opportunity to symbolically represent, to themselves and others, the lives and social relations of the dead.

Tribute videos, ash scatterings, themed funeral services, assorted keepsakes, pet memorials, Internet memorials, webcasts, party planning, and jewelry are just a few of these cultural goods that the funeral industry has begun making a part of their merchandising repertoire. These goods are largely independent of the corporeal dead body, as a body does not need to be present in order for such goods to be sold. Instead the use of these cultural goods is dependent upon the ability of the consumer to coproduce a memorial for the deceased, products that can be purchased in multiple copies and formats or can involve more than one consumer at a time.

The death care industry has had to frame its goods as necessary enough to mobilize consumers and realize revenue streams. Simultaneously, it has had to address the needs of a progressively more ethnically, religiously, and ideologically diverse marketplace. The death care industry has had to present its goods as universal in need but individual in application. To accomplish this, the death care industry made customization of nearly all of its products and services available to customers. The base product (e.g., a casket) is readily identifiable to consumers, and yet, via various appliqués and accoutrements such as engraving, pillows, and shelves, the possible permutations of the end product are nearly endless. The death care industry began promoting its own personalization stance most heavily in the 1990s, and this trend continues to the present.

Finally, the continuing rise in the cremation rate in the United States (approximately one third of all cases) has had a significant impact on the death care industry. Cemeteries are increasingly providing not only burial services, but columbaria, or niches, and scattering gardens. Casket companies have diversified their product lines and now many offer urns, keepsake mementos, and other services. Historically, most of the revenue earned by funeral homes came from the sales of burial caskets. Many funeral homes have also adapted to rising cremation rates by emphasizing services and the creation of funerals as events.

Cultural Structures Affecting the Economics of Death Care

The economics of the death care industry is historically linked to broader cultural shifts, technological developments, and various economic trends. One such structure that impacts the means of production is consumer demand. Consumer demand varies depending on a number of factors, including the death rate, age demographics within a given market, religious attitudes (especially with regard to cremation), region of the country, and spatial distribution of the population that may have an effect on the degree to which a population is tied to a locale.

The competition for consumers has added weight, with so much at stake in anticipation of the baby boom customers. There are a number of dimensions along which marketing efforts in the death care industry take place. Funeral homes have traditionally relied on word-of-mouth references, aftercare programs in which a representative of the firm follows up with the bereaved, the inclusion of the firm's name and logo on calendars and on items like napkins or paper plates that may be used in a funeral reception, and advertisements in the obituary sections of newspapers and church bulletins. Sponsorships of area organizations, participation in charity events, and involvement in civic organizations have also served to promote funeral businesses. More firms are beginning to turn to radio spots and television ads for marketing purposes.

Branding is becoming increasingly important, especially among corporations that can leverage their abundant resources in combination with their diffuse geographical presence. Some companies, such as SCI, maintain a multifirm presence in a given market region by designating individual firms to represent different lines of brands (e.g., one firm is a low-cost provider, another emphasizes cremation services, and still another attends to the needs of a particular ethnic demographic). Stewart Enterprises uses its brand to promote its combination cemetery–funeral home firms. Some national brands have also created relationships with nondeath care–related companies like airlines or other service providers from whom loved ones might draw after someone has died.

Branding is also deployed with regard to iconic or highly recognized products. Some companies specialize in purchasing licensing rights to highly visible brands like Major League Baseball, Thomas Kinkade, and the American Kennel Club, among others. This allows manufacturers of products such as caskets, urns, and guest registries to brand those goods with, for example, the deceased's favorite athletic franchise.

Contemporary economic trends such as globalization and flexible specialization are also apparent in the death care industry. The withdrawal of highly restrictive trade barriers allows companies to establish branches outside national borders. There are multiple publicly traded companies that maintain an international presence. Batesville, the world's largest casket company, has, along with its manufacturing plants across the United States, two plants in Mexico. Batesville's distribution system is capable of providing rapid delivery of personalized caskets to funeral homes. This is also accomplished through the implementation of procedures that allow companies to create a basic template (e.g., a casket) at core manufacturing sites that can then be specialized (e.g., adding unique cornices) at various distribution centers. This system is increasingly used by companies that have several funeral homes in a single market. Fixed assets like storage facilities, equipment, hearses, and limousines can be shared among the various firms within a market.

Internet technologies have created the conditions for a surge in retail websites that sell goods like caskets and urns that were previously sold only at funeral homes. Retail differentiation has also affected "brick-and-mortar" stores. The consumer warehouse store Costco, for instance, now sells caskets at some of its branches. There are also specialty stores now present in most metro areas that sell flowers, urns, caskets, registries, and other goods straight to the consumer.

A final trend in the death care industry is related to rising social concerns over the environment. Formaldehyde is carcinogenic, and to curb its use many consumers are turning to ecofriendly burials that do not involve embalming fluids. Green cemeteries prohibit burials of bodies that have been injected with embalming chemicals and do not allow metal caskets. Biodegradable caskets and urns are rising in demand. Many consumers opt for cremation for environmental reasons, though it too carries the risk for air pollution. Some in the industry are looking to alternatives of body disposal such as freeze-drying (promession) and dissolving (resomation).

Death Certificate

The death certificate is a document by which death is legally recognized. Permanently filed with

the state or district health department, the death certificate is a legal source of information that contributes to the needs of society that continues in function and structure after the individual is dead. The death certificate represents one of the officially reported documents surrounding an individual's life or, more significantly, death. This document includes a variety of information, the most important of which are the cause and circumstances of death, information that is used by public health analysts, government officials, and private business interests to estimate population growth, delineate health problems and assess health progress and program planning needs, and study the history of disease.

Like birth, marriage, and divorce, death is a social event that is celebrated through rituals and institutionalized through documentation. Death entails a legal process of registration that generates an important by-product, namely vital mortality statistics that provide the data essential to the construction of death rates, such as crude death rate, age-specific death rates, and the age-adjusted death rate. The creation of life tables to determine life expectancy among a stationary living population also is possible using accumulated death registry data. Such information allows for the study of sociodemographic correlates of multiple causes of death as well as more basic comparisons of death rates by age, sex, race, marital status, occupation, and level of education.

The death certificate provides information that is useful to population forecasting, adding to our knowledge of life expectancy, and provides information essential to those interested in genealogical study. As a historical document that recounts significant portions of an individual's life, it thus adds to the history of a community. One critical component of the certificate of death is that of medical certification. Other aspects of this document inform us of the overall ethnic and racial composition of a population, the levels of education, how people respond to the need to provide specimens for scientific study or the donation of organs, and the level of acceptance of nontraditional methods of body disposal such as cremation. Although less direct, an indication of movement patterns of the population also can be suggested from information recorded on this document. Finally, if certified by a medical examiner, information and testimony relating to this document can be used in criminal and civil courts of law.

Evolution of Death Registration

The term *statistics* is derived from the Latin phrase *ratio status* and the Italian equivalent *ragione di stato*. Initially employed in the study of practical politics, the concept has undergone transformation from its original 17th- and 18th-century meaning and application to understanding the political science of European nation-states. Influenced by the statistician Quetelet during the early 1800s, the numerical element of a two-part conceptualization of statistics later began to take root, and it is this numerical component that came to dominate definitions of the term as it is currently used to mean the numerical study of social groups.

Vital statistics represent important events and are recorded at the time of birth, marriage, divorce, and death. Parochial registration of baptisms and burials were recorded as early as 1538, and the initial numerical scientific study of death records, authored by John Gaunt in 1662, is based on these data. Gaunt's categories included causes of death—a recording of vital information as a part of the evolving system of registration, which was to have, in the words of Edwin Shneidman, "great social and medical significance."

The investigation of death by coroners originated with the Articles of Eyre in 1194 England. These articles called for the election of three knights and a clerk for each English county whose assigned task was to protect the financial interests of the Crown when the death of other than an Englishman occurred. By the late 1400s, English justices of the peace had assumed the coroner's fiscal duties and, by 1538, parish clergy were required to keep a record of christenings, marriages, and burials. This form of graves registration documented by English clergy marked the origin of death and burial records, though Henry VIII may actually have initiated the registration of deaths in 1532 when widespread panic and fear erupted over the plague.

The oldest systems of registration of vital statistics are found in Scandinavian countries beginning with Finland in 1628, Denmark in 1646, Norway in 1685, and Sweden in 1686. Throughout the course of the 17th and 18th centuries, improved

documentation of public records and registries made quantitative analysis of health-related problems possible, especially when civil registration of births and deaths was first introduced in England and Wales in 1836.

By 1836, concern about the concealment of homicide and grave robbing prompted passage of the Births and Deaths Registration Act, which required that a death certificate be issued prior to burial in England and throughout Europe. This concern was prompted by the 18th- and early 19th-century practice of body snatching to supply cadavers to English physicians for instruction and research. However, it was not until 1911 that data on the cause of death, undertaken in Sweden, established the process of officially recording each death.

Death Registration in the United States

European colonists brought the graves registration system to the North American continent. In 1632, the Virginia colony passed a law requiring a representative from every church and parish to present at court a register of christenings, marriages, and burials for the year. This practice continued until 1639 when a registration law passed for the colony of Massachusetts mandated that responsibility for registration be transferred from the church to government officials, who began the task of recording vital events—namely, marriage, birth, and death. In 1644, this registration law was made obligatory.

The separation of church and state required by the Constitution of the United States held implications for the registration process. This early interest in vital statistics was based on fear of epidemics and a belief that population size is the most important element of state power, especially its resources and military strength. As local and state governments developed an infrastructure to deal with 19th-century epidemics, responsibility for death registration increasingly shifted to urban health departments and boards of health. These agencies also developed epidemiological strategies that led to the collection of information pertaining to regions where infectious diseases were localized; thus the number of deaths caused by infectious disease could be enumerated. Maryland and Massachusetts adopted a statewide registration law in 1842, and by 1851, seven states had enacted similar laws. However, it was not until 1900 that a centralized system of death registration was established. By 1933, all states had been accepted as a registration area.

The earliest U.S. mortality statistics were based not on death certificates but on the information collected during the decennial census. From 1850 to 1900 the decennial remained the single source of official mortality statistics in the United States. Then, in 1900, mortality data were gathered and issued annually by the federal Bureau of the Census on the basis of death registration.

Until 1946, the U.S. Bureau of the Census collected and reported national registration information. In 1946, this function was assigned to the Public Health Service, an organization that created the National Office of Vital Statistics. In 1960, this office was merged with the National Health Survey program to form the National Center for Health Statistics, an organization that, in 1987, became a part of the National Centers for Disease Control, currently known as the National Center for Health Statistics.

Information Contained

The death certificate has three basic purposes: (1) It registers the fact that a person has died (the registration process); (2) it certifies an opinion regarding the cause, circumstances, and manner of death (the certification process); and (3) it provides information that may be used for postmortem statistical and epidemiological research purposes. The importance of accurate and complete information is underscored by the fact that such information is used by local, state, and national government agencies and private sector organizations to monitor morbidity and mortality for scientific study, planning and changing public health programming, and other health-related initiatives, as well as for legislative action and research funding.

Cause of death is one of the most important types of death information recorded; it is based on the application of the International Classification of Diseases (ICD), a three-digit whole number with one or more decimal points added.

In addition to recording information that may hold global consequences, in the United States the death certificate must include certain data such as information pertaining to the decedent, the names of parents, the disposition of the body,

circumstances of death, and contributing cause(s) of death. It is also required that this document be signed by a physician or, in the case of equivocal death, a medical examiner.

The underlying cause of death is yet another important part of the mortality statistics recorded on the death certificate. This information serves the needs of public health officials whose interests lie in determining the direct and indirect cause(s) of death (such as infectious diseases) and the underlying cause of death (involving chronic disease and illness).

Recording the Underlying Cause of Death

At the beginning of the 20th century, infective and parasitic diseases constituted the major causes of death in the world population. Documents show that pneumonia and influenza, tuberculosis, diarrhea and enteritis, and childhood diseases were the major causes of death in 1900. In the wake of the vast positive effects of the medical health revolution of the past century, chronic diseases have replaced infective and parasitic diseases as the most important public health problem.

The precise documentation of the immediate cause of death, the intervening cause of death, and the underlying cause of death holds many implications of a legal and public health nature. First, information gleaned from the death certificate is used to settle estates and to determine beneficiaries of insurance policies and pension funds. In the second instance, information based on death certificate data provides statistics that are used by health care professionals in making determinations of the patterns of disease, for developing prevention strategies, and to identify weaknesses or deficiencies in health care delivery policies.

Known as diagnostic coding, the immediate causes of death differ from mechanisms of death. The following definitions guide these efforts:

- *Immediate cause of death:* the condition or complication that immediately precedes the death
- *Intervening cause of death:* other conditions brought about by the underlying cause and contributing to the death
- *Underlying cause of death:* the disease or injury that initiated the events resulting in death, or the circumstances that caused the fatal injury

These important distinctions call attention to the need to produce accurate public health data documented by those tasked with certifying death.

Conclusion

The U.S. standard death certificate has long been used as a guide for states to follow. The most current revised U.S. Standard Certificate of Death, implemented on January 1, 2003, provides an opportunity to create additional information, such as date of injury and description of how injury-induced deaths occur, information pertaining to traffic fatalities, the effect of tobacco products in the cause of death, and whether female decedents were pregnant. These changes hold important implications for the future.

It is also certain that revision of the ICD will have a marked effect upon certifying the cause of death. With a different method and rules for grouping diseases and classifying the underlying cause of death, system change affects the numbers and the ability to engage in the comparison of disease and other causes of death over time.

Death certificates serve as the foundation for understanding the cause of death and guide decisions about the allocation of medical resources. With increasing competition for available health-related research dollars and social service activities, researchers and other interested analysts hold an interest in the accuracy of the certifiers' recordings. Recoding refinement will undoubtedly lead to changes in the ranking of the most important causes of death; it is this kind of information that serves well the needs of those in charge of research funding priorities.

Finally, death statistics are essential for assessing the social, psychological, and public health of our communities. Thus, appropriate mortality statistics are of crucial importance for the future quality of life and health of a nation.

Death Education

Humans have grappled with the mystery of death since they realized their own mortality. This ultimate cognitive and emotional challenge to make meaning of the cessation of life and its aftermath for the deceased and those surviving has led to a rich history of education about death across all cultures and at all ages of the life span. Death education may be defined as the informal or formal teaching and learning about the many facets of dying, death, and loss. This entry considers the various forms that death education may take; the goals of death education; its history and place in contemporary society; the relationship of death education to culture, religion, and life span development; and current issues in death education and its potential for the future.

Format and Goals of Death Education

In its most common form, death education occurs informally whenever discussions about death arise. For the young child, it may appear as an event leads to the inevitable questions directed to parents—a teachable moment. It may also occur for married couples who, in completing an advanced directive, desire to avoid legal issues relating to the fate of an individual hospitalized in a vegetative state. In such cases, death educators may be parents, friends, religious leaders, books, movies, or any venue in which death- and dying-related information is conveyed.

Death education also is experienced on a more formal level, such as in a classroom environment where an instructor guides a group of learners in understanding the content areas of death, as well as to help them interpret their own values and experiences with death. Such formal forms of death education take on a variety of formats, from short continuing education workshops and modules embedded in a broader course to semester-long courses. In this instance formal death education classes are sometimes found in high schools but more commonly in university curricula, in nursing and medical colleges, in religious institutions, at conferences on death and dying, in webcasts and satellite conferences, or in worksite in-service programs.

Increased recognition of the importance of both types of death education is due to a number of factors that affect contemporary society. Medical technology has increased the length of life, but these advances confuse many as they try to understand the many implications of the prolongation of life. Globalization has enriched individuals' encounters with others with different traditions, including the rituals and rites of passage directed toward the end of life. And television, the Internet, and other forms of instant communication have made the transmission of information almost immediately accessible to anyone.

The goals of death education tie into personal, intellectual, and professional needs. On the personal level understanding dying and death aids in the clarification of personal values, leads to self-understanding, and helps one to set priorities in life. It is through the lens of mortality that people determine what matters to them the most, examine their religious teachings, and ponder the existence of an afterlife. Death education can also provide necessary understanding of the process of dying or instruction on how to speak to and help those who

are grieving. Most importantly, it can provide the tools that may be helpful when information or support, such as treatment, hospice, or funeral arrangement, needs to be accessed in the face of crisis.

On the scholarly and professional levels, death education can satisfy intellectual curiosity in an interdisciplinary framework. Social historians such as Philippe Ariès have been interested in tracing the changes in attitudes toward death that accompanied different historical periods, ranging from the notions of death as natural to death that is feared and denied. Death educators can teach their students about the changing nature of death concepts in children, ultimately leading to a more tolerant approach to children's reactions to the loss of a loved one. Most importantly, medical practitioners benefit from instruction about death and dying, which would lead to more compassionate treatment of those who are suffering from a life-threatening illness and greater awareness of the physical, emotional, and cognitive demands that death places on survivors. Death educators provide an environment wherein open discourse can be promoted for personal enrichment as well as for improved social policy and political decision making pertaining to the prevention of war, nuclear proliferation, and global warming.

History of Death Education

Death education can be traced back to the 1960s, when courses emerged, such as Robert Fulton's course on death at the University of Minnesota, Robert Kastenbaum's course at Wayne State University, and Dan Leviton's course at the University of Maryland, which was the first death and dying course in the public health field. From that humble start, death and dying courses proliferated to the point where virtually every college campus now offers a course in thanatology. Central to those early courses was the theme that quality of life would be enhanced by understanding death. The early death educators had limited published materials to draw upon, and perhaps that has contributed to what has become an interdisciplinary field. Knowledge about death was gleaned not only from the meager writings in psychology and sociology but also from the fields of literature, medicine, anthropology, and philosophy. Today there has been a virtual explosion of written material, including research published in journals such as *Omega: The Journal of Death and Dying, Death Studies,* and *Mortality.*

Two major teaching methodologies emerged from those early courses, and remain prevalent today. In the didactic method of death education, knowledge is typically delivered via lectures, reading, and discussion. The experiential form of death education emphasizes reflection and analysis of personal encounters with death, including emotional responses and processing of values and spiritual concerns. Evaluation of these teaching methodologies indicates that students learn content best via the didactic method, whereas the experiential method reduces death anxiety and leads to values clarification.

Issues in Death Education

Many of the goals of contemporary death education programs continue to mirror the first attempts at formal and informal education. And as the field of thanatology has evolved, so too has death education. In particular, the use of the computer for online education has opened up many new learning opportunities. On the informal level, information about virtually any aspect of death and dying may be accessed on the Internet. The challenge for the consumer is to identify reputable resources. On the formal level, many universities now offer their courses online. These courses may also incorporate the didactic and experiential elements by requiring that students participate in online discussions during which they share their opinions and personal encounters with death.

The Internet also helps promote global education and this too has influenced the perspectives that death educators take as they respond to an increasingly diverse student body and a cross-cultural context. Death educators recognize that cultural sensitivity is essential, especially among mental health and medical practitioners who work with the dying and bereaved. And while informal death education has always been a part of cultural narratives and teachings, the universal formal aspect of death education beyond the boundaries of the United States, the United Kingdom, Germany, Italy, and Japan is becoming better known.

A standard module in death education classes considers the development of death concepts, grief

in childhood, and issues facing the bereaved at different points in the life span. It is perhaps ironic that little formal work exists for children or people in the later stages of life. Death education in middle and high school classes is still relatively rare and often is controversial. For adolescents and young adults, death education most frequently occurs within the context of tragic events such as death from suicide, accidents, or homicide. For the middle-aged and elderly, life experiences are the most frequent death educator, although many turn to books and community events to inform them of death-related issues. Because of the potential for disseminating inaccurate information through the news and entertainment media, a current and future challenge for death educators is to provide educational programs that respond to the needs of all age levels and to more effectively utilize the media to disseminate accurate information and resources.

The first death education course of study consisted of survey classes in undergraduate liberal arts programs. Soon, more sophisticated offerings entered into professional nursing, medicine, social work, and clinical psychology programs. As end-of-life issues become better known and commonly shared, more workshops and other opportunities for continuing education have emerged, and yet postgraduate educational opportunities remain rare. There are graduate-level programs in thanatology, and death educators can become certified through professional organizations, but in both instances standards are not uniform.

Following current trends in pedagogy, death educators have incorporated methods of student engagement in the classroom, ranging from the use of drama—such as the play of a woman dying of ovarian cancer, by Margaret Edson, titled *Wit,* used in professional, undergraduate, and graduate education—to internship and service learning projects wherein students work in the field in a voluntary capacity and then bring their experiences back into the classroom.

Similar to other fields of inquiry, thanatology has increasingly integrated research and practice, through a process of "evidence-based practice." The idea is that intervention works best when it is informed by research findings, and research is more relevant when researchers are aware of the pressing concerns of clinicians. So too has this movement affected education, where the scholarship of teaching and learning has offered ways of researching educational methodologies to determine best practices for teaching and learning. Given its unique charge, death education currently is benefiting from this approach, as more scholars seek the most effective way of teaching about, and advocating on behalf of, end-of-life issues. The commitment toward the educational enterprise, formal and informal, at all levels of the life span, is evident in the work of death educators. It is their belief that in educating about death and dying, they truly are promoting an enhanced quality of life, both at the individual level and for the greater good of humanity.

Death in the Future

A discussion of death in the future can include topics relating to predictions about demographic

shifts in mortality, transitioning grieving, and burial practices. While all these issues are important, changes in the social characteristics and reactions to death revolve around more fundamental questions about the ontological nature of death. Examining the cultural understanding of death can help reveal the way death will look in the future. It is suggested here that as medical technology advances, biological death will wane in significance while sociocultural considerations will become increasingly important.

In contrast to the past, when war and acute injury and disease were leading causes of death, the present epoch is characterized by chronic illness deaths. That is, death today is linked not so much to singular moments but to the cumulative effects of ongoing health behaviors. As biomedicine continues to detect, intervene, and manage chronic illness, more people will continue to live longer. But death in this era of unprecedented life expectancy may at times be prolonging life of significantly diminished quality. In the future, health care advances perhaps will deliver a more successful aging process, with less prolonged morbidity. Death also may be seen as less tragic when individuals are given a chance at a full biography with relatively full functional ability.

Biomedical and social-behavioral fields differ in focus, but the epidemiological trinity of agent, host, and environment can accommodate interdisciplinary perspectives. Instead of viewing this triad strictly in terms of physical components, broader social definitions, including behavior and lifestyle, various social systems, and social psychological components of the environment will be necessary additions to future inquiry as society continues to struggle and adjust in the era of chronic illness. With extended periods of end-of-life dysfunction, this will include identifying typical physical health dangers to living independently, as well as social factors such as bereavement, isolation, prolonged grieving, caregiving, and widowhood. These critical social-behavioral factors signify potential displacement from social roles and extensive dependence on others prior to death.

Additionally, the variety of social practices surrounding death are not static features of human history but change in relation to structural conditions. For example, increasing scarcity of space, particularly in urban centers, gives impetus for growing rates of cremation. As cremated remains require significantly less space than do bodies, cremation should continue to grow in popularity in relative proportion to increasing expense of scarce burial space. In general, death's effects on similar social practices likely will continue to respond to constraining material conditions of society.

But the most central consideration about death in the future concerns the definition and meaning of death itself. Like its surrounding practices and institutions, cultural meanings of death vary across time and context. Religion and medicine have different visions of death and these intersect with human history, the former being clearly dominant until comparatively recent successes gave medical science unprecedented significance. Moreover, religion and medicine hold a contentious relationship, as scientific advances challenge religious prescriptions; this is exemplified in the case of euthanasia. Finally, the social meaning of death changes as medicine continually adjusts its death criteria. The sections that follow describe how advances in medicine will establish new understandings of death and alter what it means to be human.

Death and Self-Concept

Criteria for the declaration of death have shifted as medical diagnostic capacities improve. Continual revision of death indicators has produced collateral shifts in the concept of death and what it means to be human. Until recently, death was delineated by the cessation of a beating heart. This was particularly problematic in the past when death diagnoses were vulnerable to error. Legend is that people were buried with a bell to be used in those instances when the "deceased" woke up. The saying "saved by the bell" is attributed to this past practice. Even if the factual matter here is mere folklore, the clear indication is that in the past, diagnosing death was a less-than-surefooted activity.

As advances in technology allowed medical practitioners to improve their diagnostic abilities, the cessation of brain activity was accepted as a better indicator of death. Moreover, the ability to mechanically motivate heart rhythm and breathing allowed many bodies to be kept alive indefinitely. With these advances, death is increasingly related to the end of one's consciousness and less related

to the physical functions of the body. As culture still is in the midst of this transition, conceptualizations of death still vary widely and currently are meted out on an individual basis in the form of advanced directives, wherein individuals decide whether mechanically sustained organ function acceptably constitutes life or whether conscious brain activity is required. Such decisions imply the controversial debate over whether life has some inherent value or is only valuable as a conduit of experience. Medicine's almost unlimited capacity to sustain biological life has resonated as an increasing cultural preference to identify life as fundamentally about consciousness rather than organ function. Even as conservative religious groups contest this transformation in the life/death concept, medical advance likely will continue to propel the historical trajectory toward life-as-consciousness.

The End of Death

Developments in medicine have challenged past understandings of death, and the rapid pace of scientific advancement may culminate in the end of death, at least in its current form. Research beginning in the 1960s put human brain transplants within the foreseeable reach of medical science. Whereas for the lay public this largely remains the stuff of science fiction, scientists have successfully transplanted the brain of one dog to the neck vessels of another while maintaining the biological viability of the animal. As medicine continues to develop, there is reason to suspect that these could render biological death a historical artifact with interesting sociological possibilities. Although this future possibility may be difficult to foresee, the history of medicine is replete with many accomplishments that were thought impossible. It was only 200 years ago, for example, that Ephraim McDowell shattered the pervasive belief that surgically opening the abdominal cavity meant inevitable death for the patient.

The prospect of brain transplants predicts transformations in cultural notions of life and death. Whether or not any such procedure materializes, even the discussion of brain transplants implies future reconsideration of what it means to be human. Questions immediately emerge about whether selfhood belongs to the person of the brain, the person of the body, or some new person altogether. Cultural inclination is that the person of the brain has claim to selfhood insofar as the brain is thought to store the contents of the self, including the biography, experiences, values, and will. But this conclusion implies transitioning meanings of death.

Current debate about euthanasia centers on opposed claims about the inherent or utilitarian value of life. Right-to-life activists suggest that life has sanctity regardless of consciousness; that is, the value of life is unaltered by one's ability to experience and interact with one's environment, as in the case of those in persistent vegetative states. Right-to-die positions suggest the value of life turns on consciousness; life's value emanates from experience and interaction. If it can be assumed that the selfhood of the brain-transplant patient would be given to the person of the brain, it is easy to see how the prospect of brain transplants supports the idea that consciousness is the definitive quality of human life. This would continue or perhaps culminate in the trajectory of cultural conceptions of humanness, where the brain increasingly is considered the central human organ. While lingering notions about the sanctity of life are bolstered by the fact that the body and brain remain paired, disaggregating the body and brain likely will cement consciousness as synonymous with human life. Of course, cases such as Nancy Beth Cruzan, Karen Ann Quinlan, and Terri Schiavo suggest this will be contested in the courts, but the large-scale trajectory of the life/death concept toward consciousness suggests these politicized moments are small resistances to a sweeping cultural tide.

A concept of death that is wholly defined by consciousness likely will place death more fully within the realm of culture. Those things associated with consciousness, such as experience, sentience, values, will, and intention, all interface with and are dependent on the external, social environment. If biology increasingly is disassociated with death and consciousness continues to assume a more central role, it may be said that life and death will become largely understood as social phenomena. In other words, if consciousness is synonymous with life and by definition entails social interactions, then death, as the cessation of consciousness, will come to mean the cessation of social functions.

New Approaches for a New Concept of Death

The social and behavioral science of death currently relies heavily on the meanings and impacts of biological death. But a concept of death that is fully related to consciousness propagates it more fully as a social matter. The social-behavioral sciences therefore ought to experience and embrace a new role in studying death and fleshing out the widening parameters of death's increasingly social features. This is not to say that biology and medicine will not have equally, if not increasingly, important roles to play in managing life and illness, but the cultural implications of death that are essentially related to consciousness suggest expanding roles for social science disciplines. It should be clear, however, that this reflects a transition in the cultural definition and meaning of death, not denigration of the importance of particular scientific fields.

In a future era of death that is quintessentially social, society will be challenged to find new interpretations of death that are not inherently predicated by the biomedical paradigm. One possibility for the meaning of social death is that of sociopersonal change. Something about a person comes to an end and will never be lived by that individual in that way again. When that happens, part of a person dies; but with a fully social notion of death-as-change, the person can mourn and then be reborn as a changed person. As it is radically distant from current cultural conceptions of death, this may seem like an "oddball" explanation. However, an increasingly social concept of death could make currently radical interpretations commonplace.

Some classic social science concepts may be recast in light of a new social notion of death. For example, the stages of the life course are punctuated by role transitions, as in the transition from child to parent. Significant role transitions represent shifting modes of consciousness, an uprooting and reconstituting of one's social place. Child-consciousness and parent-consciousness are different, not only because of the cumulative experience of the older parent but also because one's social place is acutely altered when one assumes that role. Such transitions often can be a rather sharp break from one's past role. "In a past life . . ." is a popular figure of speech that captures these types of role transitions, but future cultural conceptions of death-as-change may transform such sayings into more literal forms. That is, death might be culturally understood as what happens when one exits a past life role and is reborn into a new one.

The trajectory of the concept of death-toward-consciousness, combined with future prospects of medicine, suggests that in coming decades culture will experience radical transformations in understandings of what death means. These transformations will usher in new roles for science and medicine, including avenues of study for social and behavioral science that are not wholly encapsulated by the social fallout or social construction of biological death, but speak to the very notion of death itself.

Death Mask

A death mask is usually a wax or plaster cast of the face, created once a person has died. Although somewhat uncommon in the 21st century, in the past they were produced for a variety of reasons, including as a homage to the deceased, for use in rituals, to be used as effigies, to create a record of the deceased's facial appearance, or for scientific and medical research. Famous people who had a death mask include Benjamin Franklin, Oliver Cromwell, Isaac Newton, Ludwig von Beethoven, Friedrich Nietzsche, Ned Kelly, Joseph Stalin, Mary Queen of Scots, and Frédéric Chopin.

Typically, death masks are created soon after the individual has died and before gravity has begun to distort the facial features. Because the mask comes directly from the face of the deceased, it is an extremely accurate and precise representation of the person. This also means, however, that the cause and pain of death can also be seen in the masks; for example, it is often possible to tell whether the deceased had suffered a stroke due to the drooping of one side of the face.

The process of making a death mask is relatively straightforward. First, the facial features may be manipulated to present a particular expression, before lubricant is spread over the face and neck and a casting substance is applied to the face. Once the cast has set, the lubricant allows it to be removed in one piece. The cast can then be left in this state or embellished with paint or jewelry. Sometimes masks have been made from iron or other metals, such as bronze.

Death masks have a long history throughout the world and have been found in many early civilizations, including the Incas and Roman Empire. Many historians and archaeologists have cited their earliest known origins to be in ancient Egypt. Evidence found in Egypt suggests that between the Middle Kingdom (approximately 2000 B.C.E.) and 1 B.C.E., death masks were sculpted as a likeness of the face of the deceased and placed on top of their mummified remains before interment. In accordance with beliefs about life after death and the fate of the soul, it was believed that these masks would provide a face for the dead in the afterlife and enable the returning soul to recognize his or her own body. Sometimes a more lavish sculpture of the deceased's face would also be left in their tomb. These masks would be adorned with gold and jewels depending on the status of the deceased individual. The most famous of these is the gold mask of King Tutankhamen.

Death masks have been used in funeral rituals throughout the world. Both in the past and today, for some African, Oceanic, and Native American tribes, death masks—made either directly from the face of the deceased or as a likeness—form an important part of the funerary rites that surround the dead person. They are often used to evoke the image of death at these ceremonies or to assist the deceased's soul in its transition to the next life. These masks may also be used in other tribal ceremonies to remember and honor the dead. In this way, they can act as symbolic markers between the past and the present.

Between the 14th and 18th centuries in Europe, death masks were commonly used by sculptors to recreate a lifelike face on statues or busts of the deceased. During this time, death masks were also used as effigies of notable people, particularly of royalty and statesmen, such as King Henry VII of England and Vice Admiral Horatio Nelson.

Throughout the 18th century, and into the 19th and 20th centuries, death masks were used extensively by those interested in health and disease. As a result, death masks were regularly used by medical practitioners and scientists in their search for the cause and affect of what was considered to be "unhealthy behavior." In particular, executed criminals' death masks were studied for evidence of psychopathic tendencies. Masks were also used in the study of phrenology, in which the head is divided into 35 sections in order to study an individual's motivations, strengths, and weaknesses.

However, these types of studies of the face and head fell out of favor in the 20th century with the development of medical and psychological knowledge about behavior and the advancement of technical intervention in diagnosing disease. This led to a move away from bodily determination of behavioral tendencies, toward a more psychosocial understanding of human behavior. At the same time, in terms of recording the face of the deceased and in line with the growth of photography, death masks were replaced by postmortem photography, which in turn has been superseded by computer technology and forensic facial reconstruction.

Today, death masks are rarely made and, as a result, those that survive in collections and exhibitions have become something of a source of fascination and intrigue. In recent years, death masks have also been used to make political statements, such as in the case of sculptor Nick Reynolds, who created a death mask of an executed prisoner in 2007. The intention of this mask was to campaign against the death penalty.

Death Notification Process

Death is experienced not only by the deceased but also by the survivors of the deceased, who are profoundly affected by the loss of their loved one. Recognizing the profundity of the loss of a loved one, societies and the organizations therein construct guidelines—both formally within organizations and culturally—for delivering such grave news to the next of kin. For the survivors, the death notification is a ritual that initiates the final stage of the life course for a loved one and the beginning of the grief and bereavement process. This entry examines the history of death notification in the West and some of the characteristics of the death notification process in the United States, focusing on some of the common elements of its delivery for private audiences (i.e., the next of kin) and public audiences via the mass media. As no uniform death notification process exists, there is much organizational variation in the death notification process within the United States as well as cultural variation of the process outside the United States.

History of the Death Notification Process in Western Society

In the 18th and 19th centuries, prior to formal organizations taking over the death ritual, death occurred in the home and often in the accompaniment of close family and friends. The responsibility for notifying others of the death of the individual fell on the family members. In small communities, the news of the passing of a community member was spread informally between members of the community. In Europe, death was often announced with the tolling of the bells. In other communities, a funeral notice was often posted on the window of a building, allowing community members to see who had passed away recently. In other areas, notification was more symbolic, such as when individuals would wear a black badge around their arm to indicate the passing of a loved one.

In the 20th century, with the advent of new communications technology such as the radio and the telephone, death notification could now be related to a mass group of individuals relatively quickly. It was in the early 20th century that formal organizations such as funeral homes and hospitals began to take on death rituals. These organizations utilized these new forms of communication to alert people of the passing of the individual. Today, although death notification is often done in person, alerting the public to the death of a person often occurs through some communication technology, such as the telephone or the television.

Elements of the Death Notification

Several researchers, medical practitioners, and service professionals have identified key elements in the process of death notification. Some of the highly consensual aspects of the process are to make sure, first, that the family receiving the notification has accurate and adequate information about the cause of the death as well as information about the funeral procedures; second, that at least

two people present the notification; and third, that the language is straightforward. For example, the assigned emissary (i.e., the person designated to deliver the notification) should use the word *death* or *killed* when explaining the events to the family and should avoid minimizing the loss or assigning blame. It is important to keep the information simple and to the point. Emissaries also provide empathy to the family during their trying time. Importantly, the grieving family should have access to view the body. Finally, the death notification process is not a singular event. Emissaries should follow up so that the family is aware of any additional beneficial services.

Delivering the death notification must take into account the way the person died. There are common elements of death notification depending upon whether the person died unexpectedly or whether the death was expected. Both cases require that the person delivering the notification be skilled in a certain amount of emotional labor. Natural and expected death requires the notifying person to display a certain amount of empathy toward the grieving parties. For expected deaths, the notifying person is a resource for the family as they begin the funeral process. It is particularly important that the person notifying be knowledgeable about the death process. In many cases, the notifying person performs a more practical role for the grieving family than if the death is unexpected.

For unexpected deaths, the notifying person must manage the various types of emotions emitted by the grieving family. The person conducting the death notification must deliver the notification in a professional manner (some key methods are highlighted later in the entry), but the person must also deal with the range of emotions possible during such an event. The notifying person should allow the family to display their emotions, while at the same time moving the family through the beginning of the death process.

Public and Private Death Notification

Formally, upon initial discovery of a person's death, the next of kin and the general public are generally notified of the death. Under normal circumstances, death notification begins as a private ritual in which a representative from the legal, health, or medical organization responsible for the discovery or handling of the deceased delivers information to the next of kin. Notifying other immediate family and friends then becomes the responsibility of those initially notified. The purpose of the notification is to provide a firsthand, respectful, and official announcement and confirmation of the death to those closest to the deceased so that they may begin the grieving process.

Although the next of kin are responsible for notifying other formal organizations of the death (e.g., banks, place of employment, insurance company), they often delegate responsibility of notifying the general public to certain organizations (e.g., funeral homes, local, regional, or even national print and broadcast media). By so doing, the delivery and content of death notifications for the public take on different characteristics than the private notification. The initial private notification generally involves dialogue between the notifier and the notified and includes a detailed narrative regarding specific events pertaining to, and information (both good and bad) about, the actual death, which the next of kin, then, can censor for the public notification. Public notifications, on the other hand, are commonly much shorter, impersonal, delivered through mass media, and focus exclusively on positive aspects of the deceased.

Obituary and the Mass Media

The most common mass medium for public notification is the obituary. Local newspapers, news websites, or funeral home websites often list such announcements. Not only does the obituary involve announcing a death and funeral arrangements, it also serves to crystallize positive aspects of the person, such as hobbies, occupations, and professional and personal accomplishments. In most cases, along with the delivery of the death notification, the composition of the obituary, too, is delegated to appropriate organizations (e.g., the funeral home or print media). Although some individuals choose to write their own obituaries before they die, the construction of the obituary is generally a collaborative effort between the next of kin and representatives of the appropriated organization. In both cases, the resulting obituary is highly positive in tone, one that highlights the person's positive qualities while excluding negative characteristics.

The mass media often engage in two types of death notifications. First, in the case of some dramatic and tragic event, the mass media report the newsworthy facts surrounding the event. For example, on August 3, 2008, CNN ran a story of an avalanche that claimed the lives of 11 people as they were descending K-2 Mountain on the India–Pakistan border. The story included details about how the avalanche occurred; the number of, and information about, the known casualties; and recovery operations under way. However, different constraints bind the mass media on how they notify the public of a death. Usually, as a courtesy to the person's family, the mass media will not release the name of the deceased until the immediate family has been notified.

Second, the mass media deliver pseudo-obituaries for famous persons. They announce the death of the deceased public figures while noting the particulars of their fame. For example, when a public figure dies, the mass media agencies present a brief recounting of the notable aspects—both good and bad—of their public lives. In this case, the public notification of death by the mass media is intended to announce the passing of the public figure and crystallize the collective image of the person.

Organizational Variation of Death Notification

Although there are common elements in the structure and delivery of private death notifications, the formal protocol for notifying the next of kin varies among formal organizations. Within hospitals, policy constraints affect how medical practitioners deliver the notification. The Health Insurance Portability and Accountability Act (HIPAA) mandates specific procedures for the delivery of the death notification by medical practitioners. For example, medical practitioners must protect the privacy and security of an individual's records, while still providing necessary access information to legally certified public health and safety personal and funeral coordinators. For example, if the death raises concern for public health, medical practitioners must release the patient's records to the public health organization requesting the material, such as the Centers for Disease Control and Prevention. Second, HIPAA states that the death notification must be done in person by a doctor and should reveal only general information about the person's medical condition over the phone. Finally, HIPAA mandates that the delivery of the death notification can occur only by a licensed medical practitioner (doctor or registered nurse in some cases).

Trained law enforcement officers handle unexpected deaths such as those resulting from violence or traffic accidents. In the notification, police are often bound by evidentiary standards as to how much they can reveal to the next of kin about the death. For example, if the death resulted from homicide, certain details may be withheld in order to find and arrest a suspect. Police departments have varying notification procedures. Although the formal death notification for law enforcement officers is usually departmentally specific, most departments follow specific guidelines associated with the disclosure of information regarding the death.

Unlike law enforcement, although each branch of the U.S. military handles its own death notification, all branches of the U.S. military follow a similar, highly rigid death notification protocol. The U.S. Army, for example, assigns the duties of organizing and conducting the death notification to the Casualty Notification Officer (CNO). CNOs must follow a strict protocol for contacting the next of kin as well as a specific script for delivering the news of the death. The notification is delivered face-to-face between 6:00 a.m. and 10:00 p.m. by two soldiers—one officer of equal or higher rank than the deceased—and, when possible, a chaplain, all trained in death notification and grief and bereavement. Prior to notifying the next of kin of the death, they must (a) identify themselves by name, rank, unit, and duty station and military branch; (b) state that they are representatives of the Secretary of the Army; and (c) officially confirm that they are speaking to the next of kin by verifying her or his name, address, and phone number.

Cultural Variation of Death Notification

The death notification process varies within and among societies. This variation is partially organizational; however, every organization within a society is inherently embedded and profoundly shaped by the unique beliefs, values, and rituals of the broader collective culture. Therefore, the death notification process in the United States is unrepresentative of the notification process in other

cultures and societies. For example, Chinese Daoists notify the gods, along with notifying family and friends, by burning farewell messages during a postdeath ritual; they also participate in loud wailing to let immediate neighbors know of the death. Similarly, on the peninsula of Anatolia, Turkey, the survivors of the dead person cry loudly, at which time neighbors congregate in the deceased's home to share in the grief of the survivor(s). In larger towns, hodja (respected leaders) announce the death by calling the community together for a funeral service. In addition, messengers are sent door to door to announce the death of a community member. In the Republic of Guyana, death announcements are displayed on a daily broadcast, titled "Death Announcement," which is a popular television show among the Guyanese. Ultimately, regardless of the cultural or organizational variations, the death notification process represents a significant ritual in the death and dying process for the survivors of the deceased.

Death-Related Crime

Death-related crime includes behavior that results in the death of others, including the crimes of murder and manslaughter; behavior that victimizes the dead, through desecration of the dead bodies; and behavior that uses the dead to victimize the living. This entry provides an overview of these crimes and also discusses crimes involving the dead that are motivated by a search for economic gain.

Behavior That Results in the Death of Others

Murder and Homicide

The terms *homicide* and *murder* both refer to the killing of one human being by another. However, murder is a narrower concept and applies only to cases in which a killing is defined as criminal. The term *homicide* refers not only to murder but also to other acts of killing that are deemed justifiable, primarily actions that involve self-defense.

Although different jurisdictions have different definitions of criminal homicide, most states distinguish between *first-degree* and *second-degree murder*. First-degree murder requires the presence of both premeditation—that is, planning the killing ahead of time—and malice aforethought, or the specific intent to kill the victim. In addition, courts may allow prosecution of an offender for first-degree murder under the felony murder rule, if the murder is committed in the course of another felony crime. In such a case, the offender can be charged with murder even if the killing is accidental or unintentional. The general approach of the courts is that such charges should be brought only when the felony the offender intended to commit was dangerous; however, there are significant differences in how this concept is applied. Second-degree murder, in

contrast, involves cases in which the offender intended to kill another person but did not plan the killing ahead of time.

An unsuccessful effort to kill someone is known as *attempted murder.* Planning by two or more individuals to kill someone is known as *conspiracy to commit murder.*

Variations of homicide include *infanticide* and *neonaticide*. The former refers to the killing of a child under the age of 1 year. An example of infanticide is a babysitter caring for a 10-month-old infant, who violently shakes the child when it will not stop crying, resulting in the death of the infant. Neonaticide is the killing of a newborn on the day of its birth. An illustration of this variety of murder is an unmarried pregnant teenager who has an unassisted birth and then smothers the infant and throws the body in the trash to disguise the fact of her illegitimate baby.

Manslaughter

The crime of manslaughter is a lesser charge than homicide and is distinguished from murder by the offender's state of mind. In the case of *voluntary manslaughter*, the offender intends to cause serious injury or death, but the offender may have formed this intention and carried out the act in the heat of passion; for example, the offender may have been uncontrollably enraged by discovering his or her spouse with a lover, or by seeing someone attacking his or her child. Courts also distinguish between second-degree murder and voluntary manslaughter in part by considering not only whether the action was done in the "heat of passion" but also whether if was provoked by something that might have caused a reasonable person to temporarily lose self-control.

In the case of *involuntary manslaughter,* the action is viewed as the result of negligence or recklessness rather than the intent to kill. The offender may have recklessly ignored the dangers of his or her actions—for example, leaving a child alone in a parked car on a hot day. A common form of involuntary manslaughter is vehicular manslaughter, in which a driver causes a fatal accident while driving under the influence of alcohol or drugs. Another form of involuntary manslaughter occurs when someone's action in committing a misdemeanor results in another person's death; for example, a person may run a red light (a misdemeanor) and by doing so, cause the death of a pedestrian.

Serial Murders

Serial killers are those who kill multiple people over a period of time, usually using similar means and/or choosing similar victims. Jack the Ripper in England, who murdered more than five women and then mutilated their bodies, in the autumn of 1888, committed serial homicide. Another example is the Boston Strangler, who murdered 13 women over a period of 2 years in the United States. Yet another serial murderer in the United States was Jeffrey Dahmer. Dahmer compounded the heinousness of his crimes by eating parts of the bodies of some of his victims. Such multiple murders often reflect mental pathology, or a perverted sense of excitement.

Mass Murders

The term *mass murders* refers to the killing of multiple individuals in the same place at one time. There are three categories of mass murderers. These include individuals who kill a number of, if not all of, their family members. The killers frequently take their own lives or provoke the police into killing them. A second category of mass murderers are those who have a fascination with firearms and seek revenge on some group of people who they believe have insulted, belittled, or harmed them. Examples would be the mass school murders on April 20, 1999, at Columbine High School, in Colorado in the United States, where two students shot and killed 12 other students and 1 teacher before committing suicide. A similar mass murder occurred at Virginia Tech University in August 2006. A student killed 32 students and faculty members and then killed himself. The offenders frequently have planned the killings well in advance. Such murders as these two crimes are often referred to as *spree murders* or *massacres*. Yet a third type of mass murder is the situation in which an individual, or group of individuals, seeks to kill a large number of persons using a bomb or some other type of weapon, capable of killing multiple victims. Such a case was that of Timothy McVeigh, who bombed the Alfred P. Murrah Federal Building in Oklahoma City on April 19, 1995. This mass murder claimed the lives of 168 victims.

Another example of *mass homicide* is the attack on the twin towers of the World Trade Center in New York in the United States on September 11, 2001, which resulted in the death of 2,973 identified victims and 19 hijackers. Mass murders such as these are acts of terrorism motivated by political or religious ideology.

Wrongful Death

Death sometimes occurs in the course of common activities as a result of a mistake, the use of an inappropriate procedure, or an accident. In the medical world, if a patient dies as a result of surgery, because of medical error, or lack of appropriate expertise, the death could be classified as *wrongful death*. Recovery for wrongful death includes two types of civil claims. One is a claim for recovery based on noneconomic factors such as the pain, suffering, fear, and loss of the enjoyment of life of the decedent; the other claim is for recovery of economic losses of the estate of the deceased. Other examples of wrongful death are accidental death caused by defective machinery owned by the construction company, or an employer not providing appropriate protective gear for workers handling toxic material.

Violations of Norms Concerning Treatment of the Dead

Almost all societies have elaborate prescriptive and proscriptive normative systems and taboos regarding the dead. Offenses against the dead are considered to be reprehensible. In spite of the emotional intensity of taboos and norms pertaining to the dead, violations are not infrequent in many societies.

Offenses involving the dead can be separated into two major categories or divisions, in terms of the pattern of victimization. In one such pattern the deceased individual is directly the victim of the offense, with the body itself often being the object of the criminal act. In the second pattern, the dead are used in a strategy to victimize the living.

Desecration of the Dead

The desecration of the dead is almost universally condemned as morally depraved and reprehensible behavior. In the United States, as in most other societies, legal statutes protect the dead and their place of final rest, thus acknowledging the right of the dead to peaceful and undisturbed repose.

The taking of body parts as battle trophies has many historical precedents around the world. During the invasion of Korea by the Japanese in 1597, the noses of 20,000 Korean soldiers were cut off by Japanese warriors. The taking of scalps or other body parts as war trophies was part of the culture of indigenous peoples in North and South America. In medieval Japan, the Samurai warriors routinely took the heads of the enemies they killed in battles. During the Spanish Civil War, General Franco's Moorish troops often castrated the corpses of the enemy soldiers they killed. During the Italo-Ethiopian War of 1935–1936 Italian soldiers were sometimes tortured and castrated by Ethiopian troops. The Ethiopian soldiers, in turn, were sometimes killed and castrated by Galla tribesmen. In the siege of Khartoum in the Sudan in 1884–1885, General Charles "Chinese" Gordon, the commander of the Egyptian and British forces, was killed and decapitated by troops of the Mahdi. His head was impaled on a pike as a trophy. Such practices, while often viewed as socially barbaric and in violation of military law, have nevertheless occurred in some more recent combat situations. In World War II, some U.S. Marines collected the teeth and ears of dead Japanese soldiers after a battle. During the Vietnam War, some soldiers would cut off the ears of dead Viet Cong soldiers, string them into a necklace, and hang them on the radio aerial of their vehicles. The Geneva Conventions require the demonstration of respect for the dead, and Rule 113 states specifically that parties to armed conflict "must take all possible measures to prevent the dead from being despoiled" and prohibits the mutilation of bodies.

Some crimes against the dead have pathological or compulsive motivations. Included here are acts such as mutilating a body or failing to bury or otherwise properly dispose of a body. Some crimes that victimize the dead are motivated by the desire to engage in malicious mischief. Vandalizing tombs and cemeteries and desecrating dead bodies are examples of such crimes.

Using the Dead to Victimize the Living

Using the dead to victimize the living may also be the result of mental pathology or compulsion. An

individual's hatred of a person or family may be so intense or so pathological that he or she may seek to harm the survivors by committing offenses against the deceased family member, by desecrating the body of the deceased, or by vandalizing the grave.

The vandalism of certain types of cemeteries may be motivated by an intense, pathological desire to inflict insult, harm, or psychological injury on the living—a racial, ethnic, or religious group, for example. An illustration might be spray-painting neon orange swastikas, epithets, messages about killing Jews, and other anti-Semitic graffiti on the gravestones of a Jewish cemetery. Monuments and memorials to the dead may also be damaged or harmed as a means of striking out at some group or category of people whom the offender associates with a person to whom the monuments and or memorials are dedicated.

In some instances, people find humor and amusement through death and may culminate their distorted sense of humor by victimizing families of the dead. It is not uncommon for families who have had a member die to experience crank telephone calls and practical jokes. Callers may ask for the deceased, claim they are the deceased, or say they are calling for the deceased. They may vandalize the home of the survivors, or even the recently closed grave, and then notify the family of the acts. They may place orders at fast-food restaurants in the name of the deceased and have them sent to the home of the family. The family is often vulnerable at this time, and the offender may use the occasion of an individual's death to entertain himself or herself by annoying the family with such malicious mischief.

Economically Motivated Crimes

The goal of profit and economic advantage often motivates death-related crimes. For examples, individuals may steal bodies or body parts to sell, they may steal objects such as historic tombstones to sell to collectors, or they may steal bronze grave flower urns to sell to scrap metal dealers.

Grave Robbing

Graves and tombs, especially from historic burial sites, have been robbed by collectors and amateur archeologists seeking souvenirs, such as jewelry, military accoutrements, or other artifacts, that had been buried with the dead. Indian mounds and burial sites are often rich lodes of relics, such as arrowheads, pottery, beads, and even skulls or skeletons. Collectors defiling Indian burial sites for souvenirs on federal lands may be subject to a $20,000 fine and a 2-year prison sentence for the first offense, if arrested, tried, and convicted. They would receive $100,000 fine and 5 years in jail for subsequent convictions.

The dead can also be used as an instrument for the commission of criminal acts. The dead can provide leverage to extort and manipulate the living. In doing so, the living are victimized. Examples of such criminal acts include using dead bodies as hostages in an attempt to extort money or other valuables or, in some instances, to extort political advantage or other noneconomic gain from the living, immediate survivors, or the larger community. Charlie Chaplin's body was stolen in order to obtain money from his survivors. There was an unsuccessful attempt to steal Elvis Presley's body, presumably for economic ransom. There were attempts to steal Abraham Lincoln's body. The last attempt almost succeeded, but the conspiracy was thwarted before the culprits could flee with the body. Following the attempted theft, Lincoln's casket was opened to verify that it still contained his body, and he was subsequently reburied and the grave was covered and encased in a large quantity of cement to ensure that his body could not be stolen in the future.

There have also been instances of criminals using the bodies of their victims as hostages or trading material in trying to negotiate escape or for some legal or judicial advantage.

One crime racket is selling merchandise allegedly ordered by a deceased person to the survivors. The offenders can identify persons who have recently died from local newspaper obituary columns. They then go to the home of the deceased and announce that they are delivering some object ordered by the dead person. Perhaps the most common item to be delivered is a Bible, often with the deceased person's name printed on it. This makes the purchase of the Bible even more compelling. Sometimes the stakes are much larger. The family may be told that the deceased owed large sums of money on land or business deals. Occasionally there is an attempt to blackmail the

family by threatening to reveal information that would harm the reputation of the deceased.

A variation of using the dead to economically victimize the living is the fraudulent omission of death-related services. Examples might include accepting money from a family for the service of scattering the remains of a deceased family member from a boat on the ocean, or from an airplane, and not doing so, but instead simply disposing of the remains. Bodies are legally supposed to be cremated individually. However, there have been instances of a crematorium cremating several bodies at one time, and then giving the families a sack of generic remains. There was even a case of a crematorium whose furnace had broken down, but they continued to accept bodies and collected money for cremating them, but simply carried the bodies to a nearby wooded area and dumped them there.

Death-Related Music

Death-related music is that which deals with death either as a theme in lyrical content or musical composition or is in some way connected to the experience of death or cultural rituals that accompany death. The universality of death has made it a subject matter historically dealt with broadly in both classical and popular music. This entry provides an overview of the various ways in which death has been contextualized in songs of mourning, dirges, suicide songs, and murder ballads. In addition, the cultural role music has played in the rituals that inform the human experience of death such as the use of music in funeral rituals is described.

Social Construction of Meaning in Death-Related Music

Whatever meanings are associated with death should be understood in the context of the social construction of self, shifts in the evolution of identity, and the process of rationalization that prevails in modernity. Death has moved from the realm of the natural, often occurring in the home and attended to by family, to, in a contemporary sense, death as something taboo, having been subjected to medicalization and compartmentalization. Public displays of grief are unwelcome and often thought to be indicative of some psychological malady. This shift in thinking about death,

or rather not thinking about death, has resulted in the representation of death often in some horrific fantasy or sensational fashion, simultaneously making a spectacle of death while denying its natural certainty. In the wake of industrialization and the flourishing of technologically enhanced mass culture, natural death was relegated to the invisible sideline, whereas violent death became an important component of the fantasies offered up as entertainment, as in the case of war narratives, detective thrillers, Westerns, science fiction, horror films, and graphic comics. With respect to music, perhaps this void of representations of ordinary death in part helps to explain the postmodern curiosity in which death metal and reality rap indulge.

This shift in attitudes toward death offers us some insight into the fetishization of death in contemporary culture and ultimately enhances our sense of the cultural contradictions that inform death in the postmodern era. Death can be regarded as an "eternal sleep" or the gateway toward eternal life and, simultaneously, as something horrific to be avoided at all costs.

Functions of Death-Related Music

Death-related music may be understood most often in the context of the human need to externalize sentiments through social acts. Songs of mourning or loss are meant to serve the bereaved in the grieving process. Such songs may also figure in the social construction of one's own identity in that they mediate one's relation to the deceased. The representation given rise through song becomes symbolic of what once was but will never be again.

Just as is the case with visually recording death, songs of death may be read as both a means to keep the memory of the dead engaged in the living and a vehicle for the emotional distancing engendered in an attempt to manage the death of a loved one. In addition to offering the songwriter as well as the listener a cathartic vehicle for emotionally processing death, the recording of death-related music may give one the illusion of control over death.

Listening to songs that depict death in some fashion may also serve as an invitation to consider one's own mortality. Death-related music appropriates a fundamental component of the human condition, that is, the incontrovertible certainty of the demise of the individual. On some level, we are summoned to listen to songs that document the death of others so that we might be able to make some sense of our own.

Histories of Death-Related Music

Death has been a theme throughout the history of Western music. Death-related music is that which is often characterized as melancholy in mood, slowly paced, and making effective use of minor keys. Since classical music has its roots in the Church, death was featured as a prominent theme inasmuch as it was bound up with the Christian notion of death providing a dual gateway, one path leading to eternal salvation, the other, to everlasting damnation. Through death, one's being would be radically transformed. The *Dies Irae* serves as a good example of a classical music text wherein the theme of death is prominent. A "day of wrath, day of doom" is promised to the unfortunate souls.

Nowhere in classical music is the theme of death so intertwined in the work as in the case of Gustav Mahler (1860–1911), who composed a song cycle on the death of children, *Kindertotenlieder*, much to the outrage of his wife, Alma, who had borne him two daughters. In a cruel twist of fate, almost as if Mahler had summoned the "Grim Reaper," the eldest daughter died in 1907. Mahler's daughter's death came on the heels of his having been diagnosed with heart disease in addition as well as having lost his post in the Vienna Court Opera.

Funeral marches also figure prominently in classical music. Mozart, Beethoven, and Chopin all contributed to the classical origins of what might be considered funeral music. Chopin, in particular, is noted for the mournful tone of his piano sonatas employing minor keys to convey the heavy weight of grief.

Songs of Political Protest and Critique

Music has long been a vehicle for political protest. Folk singers like 1930s-era Woody Guthrie were very effective at using simple songs to make commentary regarding social injustice as in the case of his "1913 Massacre," which documents a bitter labor conflict involving copper miners in Michigan.

Seventy-three people were killed when an unidentified individual yelled "fire" during a Christmas Eve celebration; in the ensuing panic, the victims were trampled to death. Many believe the mining company had sent someone into the celebration to create the panic given that there was no fire.

Another interesting example of such a protest song that highlights social injustice is Lewis Allan's "Strange Fruit" (1939), made famous by the great jazz singer Billie Holiday. Lewis Allan was a pseudonym for Abel Meeropol, a Jewish schoolteacher and union activist. Meeropol was inspired to write the poem, which later became a song, by a newspaper photograph that documented the lynching of two southern black men. The lyrics against the backdrop of a haunting languid melody suggest that "black bodies swinging" are indeed a strange fruit born by "southern trees." While Holiday's record label was reluctant to release the recording, at the singer's insistence they did so and the track quickly became a catalyst for the anti-lynching movement and exposed the practice of lynching in a way that may have contributed to its demise.

Popular music was characterized to some extent by an element of protest in the 1960s that was led by Woody Guthrie disciple Bob Dylan. Vietnam War protest songs like Creedence Clearwater Revival's "Fortunate Son" (1969) implied a larger probability of untimely death for young working-class men who could not afford to escape the draft.

Songs of Salvation

Another variety of songs about death entertain the Christian notion that the soul will be transformed through death and either catapulted into eternal salvation or everlasting damnation. Gillian Welch's "Red Clay Halo" (2001) tells the story of a farm girl who can't seem to purge the red clay from her clothes or fingers in the hopes of finding a suitor and wonders aloud if, when death delivers her to "the other side," her gown will be gold instead. She concludes that God will not judge her for her modest, if somewhat muddy attire, as the boys at the dance do. Welch sings accompanied by a simple acoustic guitar, "I'll take a red clay robe, with the red clay wings, and a red clay halo for my head." Death is the great equalizer. In death social class is negated, as we are told the fruits of conspicuous consumption will not count for much on "judgment day."

Songs of salvation often recreate familial relationships that had been interrupted through death. In "Beulah Land" (1963), Delta blues legend "Mississippi" John Hurt invites the listener to "come on and go to Beulah Land," where he has a mother, father, and sister awaiting him "way beyond the sky." Though signifying the end of this life, death can be seen as an opportunity to live again and rejoin those previously lost through death.

Murder Ballads

Murder ballads are easily the most recognizable death-related songs in the history of popular music. Many murder ballads are derived from the balladry of old England, Scotland, or Ireland as in the case of "Knoxville Girl" (1956) popularized by the Louvin Brothers. "Knoxville Girl" is remade as a Tennessee legend, an Appalachian murder ballad, though it clearly derives from the old Irish ballad "Wexford Girl," which is itself a spin on the English ballad "Oxford Girl."

Often murder ballads offer a moralist tale told from the gallows, as in the case of Uncle Tupelo's "Lilli Schull" (1992). In "Lilli Schull," a traditional number, the singer tells how he murdered the poor girl despite her pleading, and then burned her body, and yet despite all of his callousness he still pleads for Jesus to save him prior to his own execution: "I beg him to save me like he did the dying thief."

Regret seems to figure prominently in the murder ballad. In "Killing Him" (2007) contemporary singer-songwriter Amy LaVere offers another jail-cell narrative, albeit from a female vantage point. The narrator in the song tells the story of a woman who had been promised "the sun and the moon" yet is apparently two-timed by her lover, leaving her frustrated at her inability to possess her man. LaVere poignantly sings, "She'd have to kill him to get him to stay . . . but killing him didn't make the love go away." Taking his life did nothing to alleviate her suffering, which she is left to ponder in her "8 by 8 cell."

Serial Killers and Sensationalizing Death

Another type of death-related song would be that which mythologizes the serial killer. Serial killers

have long perplexed criminologists as well as the public. Typically this type of behavior has been understood from either a demonic perspective or, more recently, a medicalized perspective. The lives of serial killers, mass murderers, and spree killers are fodder for the entertainment industry, and their positions as pop culture icons reflect the contradictions in our society with respect to violence and death. Such murderers are feared and abhorred, yet simultaneously romanticized and packaged as true crime antiheroes.

Popular music has featured songs about real and fictional serial killers. There are songs that mythologize the likes of Richard Speck, Jack the Ripper, Son of Sam, and John Wayne Gacy. The goth rock band Marilyn Manson is clearly a partial homage to Charles Manson. Sufjan Stevens's "John Wayne Gacy Jr." (2005) employs a haunting piano and strings melody with ethereal harmonies to convey the netherworldly narrative of the serial killer's terror. What is strange in this account is the singer's attempt to humanize Gacy by drawing vague parallels between himself and the murderer. Stevens sings "and in my best behavior I am just like him . . . look beneath the floorboards for the secrets I have hid."

The celebration of violent and spectacular death is a staple in the death metal genre, wherein bands such as Cannibal Corpse spin horrific macabre tales that can only be read as to create some spectacle of death, as in the song "Edible Autopsy" (1990). In fact, the entire genre of music seems to cater to some fantasy world that revolves around death and includes themes of extreme sexual deviance (i.e., necrophilia) and elements of Satanism. Reality rap, also referred to as gangsta rap, the subgenre of rap music divorced from its Afrocentric roots in which themes of violence and misogyny are packaged for commercial appeal, also offers a fair amount of gratuitous sensational death imagery. One of the subgenre's most recognizable rappers, Eminem, provides us with a good example of the type with "Kim" (2000), the graphic portrayal of a homicide fantasy wherein his own wife is his victim.

Existential Death Songs

Lastly, songs that explore the lived experience of death or ponder some existential questions regarding the end of life bear some mentioning. The Stanley Brothers popularized "Oh Death" (2000) as part of the hugely successful soundtrack to the film *O Brother, Where Art Thou?* The song portrays a conversation between the personification of death and a man whose time has come. "Death" provides the gateway to either heaven or hell and yearns not for silver or gold but rather one's soul. The singer pleads the refrain amid a dark melody, "Oh death won't you spare me over til another year."

Another example of this type of song questioning death or highlighting the absurdity of death is "Stop Breathin'" (1994) by Pavement. The narrative is one of battle wherein the lead character was "struck down by the first volley of the war." The deceased sounds as if he now inhabits some netherworld: "no one serves coffee, no one wakes up." The songwriter highlights the absurdity of war and the deceased's guilt over his own death: "stop breathin,' stop breathin,' breathe in for me now, write it on a postcard, dad they broke me, dad they broke me."

Suicide, Drug Overdoses, and Popular Music

Infamous suicides are part of the lore of popular music. Intent may be demonstrated as in the hanging deaths of folk legend Phil Ochs and Ian Curtis of Joy Division. Jazz musician Albert Ayler and soul icon Donny Hathaway both intentionally jumped to their deaths, Ayler into a river, Hathaway from a window. Rock suicides are ready-made for mythologizing as in the case of Michael Hutchence, lead singer of Australian pop band INXS, indie rocker Elliott Smith, and Nirvana frontman Kurt Cobain. Hutchence hanged himself with a belt in a hotel room, and despite widely reported speculation as to whether this was an autoerotic fatality, the rock star's death was officially ruled a suicide. Although Smith's death was initially reported as a suicide (he allegedly stabbed himself in the heart following an argument with his live-in girlfriend), the official autopsy report is somewhat ambiguous. While suggesting the strong likelihood of suicide, the report leaves open the possibility of homicide, fueling further mythologizing. Cobain shot himself at the height of his popularity. The singer-songwriter had struggled with heroin addiction and was apparently uncomfortable with his meteoric rise to stardom, which was difficult to reconcile with his punk rock ethic. At the time of Cobain's death, rumors swirled that

his wife, herself a rock star of sorts, was implicated somehow in his death. However, the death was officially ruled a suicide.

The legendary drug overdoses that litter rock mythology may be read as possible suicides. Drug use and alcohol figured prominently in the deaths of performers as notable as Janis Joplin, Nick Drake, Frankie Lymon, Jim Morrison, Gram Parsons, and Jimi Hendrix. Intent is less clear in these cases, but the fact remains that they all died of self-inflicted injury.

Jazz Funerals

The New Orleans jazz funeral is an interesting tradition, an emergent of blended African cultural death rites, which marries death and music. Borrowing from the Dahomeans and Yoruba of West Africa, American slaves carried with them the African ideal of the need for a proper burial to ease the transition of the soul to the spirit world. In fact, social aid and pleasure clubs, lodges, and the like would often guarantee burials for members, suggesting an early form of insurance.

Jazz funerals are unique to New Orleans and involve a procession by a brass band accompanying the family and friends of the deceased from the church, funeral home, or house of the deceased to the burial ground. On the way to the cemetery the band plays a mournful dirge or old spiritual, but upon "cutting the body loose" they will strike up a more rousing number like "When the Saints Go Marching In." The recession signifies a celebration of the deceased's life. New Orleans jazz great Sidney Bechet was known to have said, "Music here is as much a part of death as it is life."

Conclusion

Death has long occupied a place in the larger popular culture, and the same may be said with respect to popular music. Death-related music serves several functions in the culture, whether as art or a prop in the grieving process. Though songs that are informed by death may serve as a cathartic tool for some, clearly some usage of death as a theme in music tends toward the sensational and spectacular as a means of entertainment. There is no singular usage of the theme of death in music. In fact the various ways death is contextualized in music speak to the contradictions that shroud death in contemporary culture.

Death Squads

Death squads are secretive or clandestine organizations that generally exist outside of formal governmental or military structures and usually are formed on an ad hoc and irregular basis. They are designed to kill people and carry out other violent acts in order to terrorize a civilian population. These acts of violence are all extrajudicial, and though death squads may commit some random acts of terror, their targets are usually quite specific. Significantly, except in the rare case where they are formed by an insurgent or revolutionary group, death squads operate with the support, complicity, or acquiescence of the state, or at least some faction of it. In most cases, individual members of legitimate organs of the state (the army, the police) participate directly in death squads, and their work is usually steered in some way by elements of legitimate authority. Yet at the same time, death squads almost always include private forces and interests, and they develop considerable independence. Death squads are therefore almost always a form of state violence, targeting civilian or insurrectionary elements or actors within a state, and do not occur in the context of war between regular armies of sovereign states.

Yet they exist in a liminal position, partway between legitimate state organs and private interests. Key to distinguishing death squads from other forms of state violence and terrorism is their covert nature. This allows elites and the state to maintain "plausible deniability," by claiming that they are not involved. This is usually a transparent lie, but it is crucial to the existence of death squads. They exist so that the state may plausibly deny complicity in terrorizing its own people.

Death squads must be distinguished from assassins, vigilantes, and terrorists. Death squads kill on a greater scale and make terror their objective in a way that sets them apart from assassins, who typically focus on one or a very small group of victims. The acts of death squads are often claimed to be those of local or community vigilantes, yet death squads are not genuinely spontaneous and are directed by the government (and/or private interests allied to the elites) in most cases. They are also usually more widespread than true community-based vigilantism. Finally, death squads are an aspect of state terrorism and are used by states or factions within states to terrorize their own people. They are a terrorist tactic, but one used nearly always by states against their own people, and not by insurgent or revolutionary terrorists. While terrorists tend to kill indiscriminately, death squads kill a specifically targeted group of people.

Scope

Death squads have existed in every region of the world. The best-known cases have been in Central and South America, for example, Guatemala and El Salvador, but there have been death squads on every continent and in modern, industrialized states. Death squads are not limited to the third world or any particular region. Important instances of the use of death squads include, but are not limited to, El Salvador 1971–1991, Guatemala 1954–2000, Nicaragua 1981–1995, Argentina 1974–1983, Chile 1973–1990, Brazil 1960s to date, South Africa 1969–1993, Serbia/Bosnia 1992, Spain 1983–1987, Uganda 1971–1979, Zaire 1980s, Algeria 1960–1962 and 1990s, India (Punjab, Jammu, and Kashmir) 1980s and 1990s, Sri Lanka 1970s to date, Indonesia 1980s to date, Philippines late 1980s, and United States 1865–1871. Death squads were first used in the 19th century, though they have become commonplace only since World War II. One reason for this is that the cold war and the expansion of global media both brought increased scrutiny of civil rights violations, making it increasingly important for governments to assert plausible deniability when using violence and terror against their own citizens, for fear of losing legitimacy. This has entailed a growing paradox, for as scrutiny of human rights violations has sharpened, states have increasingly turned to covert violence, making the uncovering of the true culprits and the fate of the victims increasingly difficult. Hence there is a need to find new ways for the resolution of domestic conflicts, such as truth and reconciliation commissions and amnesties for killers who are willing to confess their crimes and provide information on the victims.

Theories

Though the scholarly literature on death squads is rather limited, many theories have been proposed to explain them, and these theories often overlap with more general theories on the nature of state violence and terrorism. Early theories tended to focus on the reasons for using death squads within particular states. The first major explanation was that death squads are produced by authoritarian or fascist states. This is sometimes true but is actually a comparatively rare case, if only because open dictatorships have less need to maintain plausible deniability. Subsequent theories held that death squads were the product of "weak states" or were an inevitable response to the existence of domestic insurgencies, though neither of these theories applies to all instances of death squad use. For a time some theorists tried to explain death squads as a form of vigilantism; these theorists emphasized the important fact that death squads include private interests and develop their own agendas, but they also tended to exaggerate the spontaneity of death squads and to accept as true what is really a transparent attempt to hide state or elite involvement. On the other hand, there is a recent shift in focus of many death squads today, toward killing homeless people or petty criminals, but again, the violence does not arise spontaneously out of a community, but is carried out by perpetrators connected to the state.

Current theories tend to see death squads in a more global perspective and stress the interplay of

local and global forces. Some theorists in the 1980s pointed to the cold war and specifically to U.S. military aid as the origin of death squads. More recent theories stress a global culture of violence and militarism, even as they also cite the importance of the global trade in arms and "security" industry. Other modern theories see state terrorism and therefore, potentially, death squads, as an almost inevitable product of social stratification, or a manifestation of routine social control run amuck, though these latter approaches are surely too broad unless carefully rooted in a specific local context. Other theorists implicated modernization and elite resistance to it in the use of death squads.

Another fruitful avenue in recent years is to explain death squads as a part of a larger spectrum of government "subcontracting" of services and responsibility, which ranges from privatization of essential state services over private police forces all the way to the privatization of violence and death squads. Some commentators have even made a specific link to neoliberalism in this regard, although state "subcontracting" exists in states that do not necessarily espouse neoliberal economic theories and seems to be a function of growing state responsibilities combined with decreasing resources.

Any comprehensive future explanation of death squads will have to include global, regional, and local factors, including the importance of cultural differences. The phenomenon is so varied and so widespread that only an integrated approach sensitive to all levels of influence (global and regional, as well as local) and careful to include local specificities will be able to adequately explain it. Given the increase in terrorism, the proliferation both of "small wars" and the means to fight them, and the growing level of media scrutiny, it is likely that death squads will continue to proliferate, but they will mutate in ways that will increase their deniability.

Death Superstitions

Superstition is derived from the Latin *superstes,* meaning "to stand over." Thus, the concept refers to the practice, based on belief, of standing over rationality of thought. In general, death superstitions have a negative connotation because these are based on unproven scientific validity. But the validation of beliefs surrounding death cannot be determined because the deceased are unable to participate in follow-up studies, thereby leaving the area of death and dying as a natural breeding ground for superstitions to evolve.

Such death superstitions vary across cultures, though there are some shared commonalities. Understanding the diversity of death superstitions increases one's sensitivity to the sources of the fear of death within diverse cultures. Many, if not most, death superstitions can be categorized within the timeline of the dying process.

Superstitions and Signs of Death

Most death superstitions refer to the signs of death as represented by the actions of animals and insects, human actions, and dreams. Blackbirds and crows, for example, characterize these death omens inasmuch as their presence represents a sign of death. Some superstitions prescribe the rare behavior of birds that include flight into a house, tapping on a window, or crying abnormally during the night. Even the number of times such cries or tapping on the window (usually three) is prescribed. Dog howling for no reason is yet another death omen.

Insects serve as a medium of the death omen. In Britain and Ireland, there exist beliefs that special sounds made by beetles and crickets represent signs of approaching death. It is believed that these insects and animals possess the ability to identify clues surrounding death that lie beyond human reach, possibly because the smell, body temperature, or wavelength of the dying person attracts the animals' attention. Less often reported death omen phenomena include the dropping of pictures from walls, unexplained cracking of glassware, breaking of a mirror, or a clock stopping at a certain time.

Death superstitions also refer to action. If someone points a finger at a funeral attendee, it is thought this gesture will bring death to that person. To maintain one's breathing while passing a cemetery is believed to be absorbing of the spirit that causes death. Experiencing dreams of one's death also is taken as a sign of impending death, as is meeting a deceased loved one in a dream.

Superstitions and Dying

Superstition rules related to responding to the dying also exist. Doors and windows should be open wide and unlocked when someone in the house is dying. Mirrors are to be turned inward to avoid reflections, and all knots should be untied. There is a belief that if the eyes of the deceased person are open, another death will soon follow. In Chinese culture, open eyes symbolize the unfinished business of the deceased. Thus, the bereaved try to fulfill the wishes of the deceased, thereby hoping to avoid future misfortune.

Chinese culture emphasizes the importance of family members witnessing the death of loved ones, especially the eldest son. If this action is not fulfilled, it is considered that the deceased did not engage in good deeds while on earth. The crying of family members during the moment of death is thought to disturb the transition of the spirit of the deceased. From the Buddhist point of view, it is urged that peaceful chanting occur.

The Funeral and Body Disposition Process

In Western culture, touching a corpse is believed to bring good fortune. The phrase "dead hand," referring to the hand of a corpse, is said to have healing powers. It is also believed that infertility can be cured through touching the dead hand. Similarly, the sheet wrapping of the corpse is thought to carry the same healing power.

In Chinese culture, the corpse is believed to have a certain *qi* that is hazardous to the health of those who come in physical contact with it. Thus, funeral workers wears gloves while handling the corpse, and family members are not encouraged to touch, except for stroking the hands over the eyes to make them close. In Chinese culture, recently bereaved persons avoid visiting the house of friends or relatives during the first month after the funeral because they are thought to carry bad qi that will cause bad luck. Moreover, attendance at funerals and weddings within that same period is not allowed because it is believed that the clash of these events will result in misfortune for both parties.

But superstitions also have the positive function of inducing a sense of death being beyond human control. After death occurs, bereaved persons look for such clues or signs. The externalization of locus of control reduces personal guilt as to the cause of death. On the other hand, if prescribed superstitions are identified but death does not occur, family members become increasingly conscious of health and family relationships. As for the death omens, these serve as guidelines for the individual to be more respectful toward funeral processions, as well as all deceased persons.

In summation, differences in superstitious views hold different functions. The Western approach encourages a greater connection to the deceased, thereby testing the reality of death. Touching the corpse of the loved one facilitates closer connection and communication. The Eastern approach addresses issues relating infectious control to avoidance of direct contact with the corpses,

thereby reducing the risks of spreading contagious diseases. Restriction of social life, for the Chinese in particular, provides space for the bereaved family to consolidate family ties and have time for personal reflection.

Decomposition

Decomposition is an essential part of the life cycle of any living organism (human beings are no exception) as it is the means by which nutrients are returned to the soil to nourish other life forms. Shortly after death, the body begins to undergo a process whereby the tissues begin to break down and decay; this process is referred to as decomposition. Throughout the stages of decomposition, bacteria and insect activity are the primary means by which this process is accelerated. Due to the popularity of *CSI: Crime Scene Investigation* and other similar TV series, this information is increasingly available in the public domain. *Taphonomy* is the science that studies decomposition and decay of an organism over time; this discipline has identified a series of stages that human bodies undergo after death.

Disposal of Dead Bodies

Many believe that a dead body presents a sanitation and health risk to the living that may be, in part, due to the foul odors emitted when a body begins to decompose. However, although the World Health Organization provides directions for staff to remove dead bodies swiftly in cases of disasters and emergency situations that result in many deaths, this is not specifically related to health concerns. There is considered to be little risk of communicable disease in the event of death resulting from trauma, although decomposing bodies will certainly contaminate water sources and can cause a type of gastroenteritis in survivors. The distress associated with decomposing human remains, with its attendant sight and smell ever present, highlights issues associated with human frailty and mortality and perhaps exacerbates feelings regarding a fear of death itself. The swift removal of bodies in disaster situations is recommended mainly for psychological reasons: in order to minimize distress caused by the sight and smell of decomposing bodies. This removal will also enable cultural, religious, and traditional obligations to the dead to be addressed by the community and is linked to providing for the mental health of a traumatized community.

Funerary Rites

Many cultures associate the decomposition of human remains after death as being unclean, possibly due to the resultant odors and visual impact upon the body of the decomposition process itself. This has led to various means whereby the decomposition process is not experienced by the living. One of these involves the burial of the entire body, usually involving some type of ritual as indicated by religious and/or secular requirements; in many instances religious beliefs require that the corpse be interred whole. Other cultural and religious beliefs differ: For example, Hindus require that the corpse be cremated, while the ancient Egyptians preferred the mummification of the corpse. Some cultures use other means, such as the Tibetan sky burial, the Comanche platform burials, and the

Zoroastrian tower of silence, each of which used a type of platform upon which the dead were placed to be exposed to the elements and to predators.

Stages of Decomposition

After death, the process of decomposition begins. The first of these stages is called "fresh" and this begins immediately as the body begins to cool and bacteria begin to break down the body. It is during this process that the gases and other substances produced serve as an attractant to insects. The second stage is called putrefaction; increased bacterial activity leads to the bloating of the body as gases formed during this process cause swelling, especially of the abdomen and areas around the face. Increased bloating and the resultant odors released as well as the bacterial activity involved in this process again serve as an attractant to insects. During this stage the skin begins to break down and become delicate. As decomposition becomes more advanced, the skin becomes more discolored, moving from a green coloration in the early stages to more brown toward the end of this stage. The third stage of this process is called black putrefaction, where the bloating has reached such a stage that the body itself breaks apart to allow the gases that caused this bloating to escape. This also provides greater access for insects. In the next stage, called butyric fermentation, the body moves on from the liquefying process of the earlier stages and begins to dry out. The internal organs increasingly disappear, as does the smell associated with the earlier stages as the body begins to mummify and move into the final stage of the process. This stage is referred to as dry decay, and it is at this stage that the bulk of the soft tissues of the body have decomposed and the longest stage of skeletonization begins. How long this part of the process takes depends upon the conditions, but this is mainly affected by the type of soil and water conditions surrounding the remains.

Preventing Decomposition

Over the centuries people have tried to slow down or even prevent the decomposition process from occurring. The use of a coffin for the burial of human remains is one way to slow down the decomposition process as was the mummification of the body, a process preferred by the ancient Egyptians. Embalming of human remains is considered one of the more successful ways to achieve this aim and has been used to good effect to preserve the remains of famous figures like Vladimir Lenin and Eva ("Evita") Perón.

Decomposition in Cultural and Religious Beliefs

Many cultures and religions have beliefs that are connected with the decomposition of human remains. Hindus believe that after death, they will be reincarnated. However, they also believe that it is impossible for the soul to enter a new body until the current body has entirely decomposed. This may be one of the reasons for the use of cremation as the means of disposing of human remains after death. Vikings believed that the soul was located within the body and could only be set free to begin its journey to the afterlife through a process of decomposition or cremation. Zoroastrians consider a dead body to be unclean; to prevent it from contaminating either the earth or fire, they expose their dead to the elements on specially built platforms.

Often a culture will have taboos related to dead and/or decomposing bodies. The Māori, for instance, consider those who have touched or prepared a dead body for burial to be unclean, and these people are not allowed to interact with others for a period of time. In modern Western cultures, although these types of taboos are often unidentified or unacknowledged, it is possible they still exist as we tend to remove ourselves from interacting with the dead and preparing them for burial as was common in the past. Now others, such as doctors, nurses, and funeral directors, prepare our loved ones for the grave while we remain at a distance, safe (at least for now) from the immediate threat of decomposition.

Defining and Conceptualizing Death

Death is generally considered the only certainty of life. At the same time, however, no matter where or when one is living, death is also regarded the ultimate mystery of human experience. The answer to the question "What is death?" is far from universal, and the concrete ways of defining and conceptualizing death vary from culture to culture. Furthermore, multiple definitions of death exist within the same culture because of the various situations and perspectives from which they are acted upon.

The question arising from the topic of death is how to be sure that the same reality is being talked about. For instance, does the concept refer to one's own death, or to the death of another? Is it a physical death here and now or an abstract idea in the past or future? Is it possible to define death at all? One could further argue that the act of making death knowable and controllable through explicit definitions, as is the case in this encyclopedia, exemplifies a typically Western project of truth seeking.

By the beginning of the 21st century, in most Western contexts biomedical definitions of death, constructing death as the irreversible end of life, are a taken-for-granted discourse. Some researchers of death hold that in such a rational or disenchanted world, death appears as a threatening and destructive immensity that cannot be averted and so must be hidden or avoided. By consequence, individuals would no longer have images and conceptions to fall back on. Other researchers, however, find it more accurate to say at the beginning of the 21st century, images of death are omnipresent. In their view, formerly shared definitions and conceptions of death, like from the Christian tradition, have not disappeared but rather are fragmented and personalized.

Death belongs not only to human nature but also to the shifting world of cultural meanings and social practices. Hence, ways of defining and conceptualizing death are dynamic and multiple. First, it is important to mention that death can only be made present through metaphors: conceptual constructs that are pervasive not only in language but also in thought and practice. Second, the definition of death depends on the social context rather than on one primordial essence. Third, understanding death inevitably involves defining life: The concepts of death and life are dynamically related to one another.

Defining Death Is Making Death Present

Death is simply impossible to imagine. Every statement on death refers to symbols rather than to an empirical reality. Death is hence conceptualized and acted upon as a process (e.g., dying), an instance (e.g., the Grim Reaper), a state (e.g., the absence of life), or a moment (e.g., one's final breath). It is only in such metaphors that death can be experienced as a real entity. In other words, defining death is an act of presentation, rather than one of representation. It is a performative act: Each definition of death fixes a specific content and brings forth death in one way or another. Whether in a scholarly publication or in social practice, death is visually or verbally defined through metaphors.

Visual and Verbal Presentations

Sometimes, death is made present through personification, especially in artistic visualizations. A clear illustration is Pieter Brueghel's painting *Triumph of Death* (1562), which shows a spectacular image of death: living skeletons coming to get insignificant creatures in a dark landscape. Another is Roger van der Weijden's *Descent From the Cross* (1435), in which the focus is on the grieving Virgin, who seems to be dying along with her son. In this painting death is made present as a far more intimate and emotional process.

Quintessential examples of verbal definitions are to be found in the writings of philosophers who have always, like artists, tried to get a grip on death. For Epicurus, death is literally nothing. It is not our concern: When we live, death is not there, and when death is there, we are not. Socrates and

Plato do not define death as "nothing" but as the liberation of our immortal soul from the prison of the body. For the 20th-century German philosopher Martin Heidegger, death is a certainty eliciting both fear and creativity. We anticipate death as a horizon or a condition of meaning: Human existence is to exist in relation to death.

Scholarly and Practical Presentations

Definitions of death can be spelled out in detail by scholars from fields as diverse as biology or theology. Like sexuality, death was earlier defined in 20th-century academia by physicians and psychologists, who constructed the concept as a natural fact of human experience. Still, no single discipline can claim sole authority concerning the definition of death. As illustrated by numerous conferences on the subject, the concept of death invites a multidisciplinary environment that brings together many focuses and approaches. Clear descriptions are of great importance because they make explicit the unspoken assumptions in relation to such issues as abortion, euthanasia, and organ donation, but each approach to conceptualizing death is inevitably limited. Most often, however, death is encountered through social praxis in rather implicit and intuitive ways. In cancer, for example, death is becoming present as an actor and being reacted upon within one's very own body.

Social Contexts of Defining Death

Death takes particular shapes in different environments, such as a home, the media, or the political institution. Furthermore, what death stands for depends on the social perspective and relationship. For instance, when a funeral undertaker is laying out a dead body, multiple and fluid contents of death emerge. Whereas for the professional, death is socially constructed as a concrete but anonymous object, for family members the corpse is still a unique subject with a personal past. Thus, when somebody dies, multiple definitions of the body and of death are simultaneously enacted. From the perspective of grief, death is not so much being defined by us as it is defining us. It becomes an intimate death for those who are related to the dead. Yet, generally death is defined and experienced from a relative distance.

Intimate Death

The death of a beloved is experienced in a highly intimate way. It may involve existential questions or a loss of self, as this self is socially shared with the deceased. When the death of the other becomes partially the death of the self, it is believed that death controls us, rather than our controlling death. Western psychological discourses often conceptualize death as the trigger of grief experiences. It is considered to cut deeply into one's guts and change one's further life. In an ongoing and ambiguous dialectic of letting go and continuing bonds, survivors are forced to search for a *modus vivendi* with the different forms of loss. Death in the context of grief is an upsetting and shattering reality. Hence, the aim of grief work is implicitly described in advisory books as the capacity to define or "place" death, instead of having death define those who grieve.

Distant Death

Death does not always involve grief. First, death can be defined as an abstract reality. Thinkers and writers discuss death in a rather level-headed way in intellectual texts. Demographers describing mortality rates and newspapers estimating the number of casualties define death in abstract figures. Second, death can appear as an embodied but anonymous reality to professionals like pathologists and coroners. Their technical approach secures a safe distance toward a depersonalized body and implicitly defines death as an object rather than subject. Third, death can also become a spectacle: In fantasy, horror movies, video games, and media coverage of car crashes, murders, wars, and disasters, death can be counted on to fascinate a large audience. The audience does not participate in such deaths; rather, they watch and forget. These deaths are socially defined as controllable death, as objects that can be manipulated, talked about, and distanced from.

Defining Death Is Defining Life

For many researchers, death is an indicator of life revealing central social processes and cultural values. Moreover, death is often considered the mirror of life because life cannot exist without death and vice versa. Whether in a dichotomous

or hybrid relationship, death is defined in terms of life.

A Dichotomous Relationship

From the 18th century onward, medical science came to define life and death as two separate entities. According to secular definitions, death is conceived as the irreversible extinction not only of consciousness and sensation but also of the individual personality. Current dictionaries hence emphasize the materiality of the human body and, more specifically, its absence of life. For instance, the 2005 edition of the *Oxford Dictionary of English* defines death as the action or fact of dying or being killed; the end of the life of a person or organism; the state of being dead; and the permanent ending of vital processes in a cell or tissue. Conversely, the same dictionary still included in its 1933 edition "the loss or want of spiritual life, the being or becoming spiritually dead."

From the biomedical or materialistic perspective, death ushers in the biological process of decay and thus terminates the human story. In other words, death is defined as the absence of life. How specific transformations of the body are related to the concept of death varies greatly, depending on the dynamics of science and technology. Initially, the moment that embodies the boundary between life and death was the cessation of breathing. Later, the stoppage of the heart served as the central metaphor for the ending of life. Finally, with recent medical developments, the beginning of death and ending of life have moved to the moment of brain death. Remarkably, progress in biomedical science and technology did not lead to greater clarity of the concept of death. On the contrary, it rather contributed to the complexity of contemporary definitions and, hence, to substantial debate on the timing of organ donation.

A Hybrid Relationship

Death is not always socially constructed as a complete break, the antipode of life, or an irreversible ontological change. In many non-Western cultures, death is not the destruction of a life on earth but rather a transitory phase in the life cycle. Decay is creative, and the deceased live on through their surviving relatives. In traditional Western contexts, in which religion served as the main source of definitions and conceptions of death, some form of actual survival or even enhancement of individual personality was postulated. In postmodern societies, with the growing authority of the self and the cultural variety of religious beliefs and practices concerning dying and grieving, the dichotomous view of a firm boundary between life and death is being challenged. Actually, every society has its hybrids. At the beginning of the 19th century people were afraid of being buried alive, as medical practice was questioning former commonsense boundaries.

Although at first sight, categories of life and death seem clear-cut and typically confined to our views on the body, a closer look reveals that the relationship between the body and the self, and between life and death, is much more fluid and hybrid. The dichotomy of life and death has been debated and questioned not only from a theoretical viewpoint but also from a medical viewpoint. The binary opposition of life and death in the social practice of hospitals is being challenged at both ends of the life cycle. Both stillborn babies and persons in a vegetative state are currently considered as hybrids, confusing the taken-for-granted categories of life and death. Although not assigned to being ontologically alive, both stillborns and the brain dead are treated as living humans. When they are being cuddled or washed, not only is there an intricate connection between the body and social identity, but what also becomes apparent is the constructed nature of the concepts of life and death.

Deities of Life and Death

Diverse cultures of antiquity mythologized a diverse set of deities of life and death. Most reside in a land of life after death, sometimes as judges, and some are male while others are female. Some deities of life and death rule as couples in love, others govern as a family; some are gracious hosts, and others are haunting ghosts. Some deities are agents of torment who punish, whereas others are angels of transformation who transport the dead to life.

In this entry the diverse deities of life and death are selected from Africa, Asia, Australia, Europe, and the Americas to illustrate the global universality of the topic without regard to any particular definitions or interpretation. Mythologies about deities of life and death from India, Egypt, Greece, Haiti, New Zealand, and Finland have been selected for the unique way each addresses and answers questions about the relationship between life and death.

Historical Presentation of the Deities

Scholarship on the deities of life and death is nearly unanimous in discerning, declaring, and defending one universal theme; however, there is no consensus concerning exactly what that theme might be. For this reason deities of life and death have no universal definition because no single unifying characteristic is common to all deities of life and death. According to one interpretation, the meaning of the motif of the dying and rising god entails the devotees' vicarious experience through the transpersonal mystical identification with the god or goddess.

According to another interpretive tradition, the deities of life and death are metaphors that personify the cyclical nature of agricultural seasons that rotate between the death of winter and the rebirth of spring. In still other traditions, deities of life and death serve as guides or psychopomps who help the deceased navigate the way to life after death. For still others, deities of life and death dramatize the interdependence of life and death; the life of one is sustained by the death of another.

Despite the conflicting and competing definitions and interpretations of deities of life and death, the universality of the topic consists of the questions engendered by a global curiosity about the relationship between life and death. People everywhere have wondered about that relationship. This wonder is embodied in the many mythologies that entertain and provide responses to the questions people pose about the relationship between life and death—questions such as What happens after death? How are people judged and who judges them? Who has power over life and death? Why do people die? What does it feel like to be dead?

India

What is the meaning and purpose of life in the face of death? On the South Asian subcontinent, Yama, the mythical first man to die, has since then been the guardian god of deceased ancestors in the afterlife. Yama is invoked in the liturgy of every Hindu death ritual. Mythologies of Yama are narrated in 2nd millennium B.C.E. Vedic literature is nearly as old as the Pyramid texts of ancient Egypt. Yama is described as the head of the grateful dead and the ruler of the departed souls, who prepares a place for the dead to rest in the world of the ancestors. In addition to being the first person to die, Yama was the first to discover the path leading to the other world. One ancient Sanskrit text records a young boy's dialogue with death. In a fit of anger, a father offered his son as a sacrifice, but when the son ascended in the sacrificial ritual flames toward the realm of Yama, he discovered that Yama was not at home. When Yama finally returned, as consolation to the boy for making him wait so long, Yama granted the boy three wishes. The first two requests were easy for Yama to fulfill. The boy asked to be restored to life and reconciled with his father, and he requested

instruction in the fire sacrifice that leads to heaven. The boy's third wish was to know the mystery of what happens after death. He asked Yama to resolve the controversy about whether or not there is life after death. Yama begged the boy not to ask that question and offered to fulfill any other wish he might have, but the boy could not be dissuaded and insisted that Yama grant this third wish. Yama acknowledged that not even the gods knew how to answer this question; nevertheless, Yama disclosed the mystery by revealing the reality of a self that is never born and never dies and recommended that the boy search for that self.

Egypt

Do the just and unjust have different destinies after death? How are people judged and by whom? What happens to one's body after death? The Egyptian myth answers these questions with one of the oldest gods of life and death, Anubis, as described in the Pyramid Texts of Egypt from the 3rd millennium B.C.E. Anubis was the chief god of the dead, depicted as a man with the head of a jackal, a scavenger who roams cemeteries, digging up the dead and feasting on their flesh. The myth of Anubis satisfies Egyptian curiosity about whether or not people keep their bodies after death. He cares for the dead and is the legendary inventor of the process of embalming, which he first administered to Osiris, who was killed and dismembered by his brother and subsequently reassembled by his sister and consort, Isis. In the Egyptian concept of divine kingship, the king, at death, became Osiris and the new king was identified with Horus, the son of Osiris and Isis.

Osiris also represented the power that brought life out of the earth. Thereafter Osiris replaced Anubis as god of the underworld while Anubis maintained his occupation and identity as embalmer and caretaker of the dead. As the guide who held the scales by which hearts were measured against the feather of ma'at, Anubis addresses the question of different destinies for just and unjust people in the underworld. If the deceased's heart was as light as the feather, then it would be presented to Osiris, but if the heart was heavier, then it was fed to Ammit and destroyed.

As psychopomp of the afterworld, Anubis prepared the bodies of the dead and guarded over them and the places that house them. During the death ritual ceremony, priests wear the mask of Anubis as he is responsible for reawakening the senses of the deceased. Anubis's enduring prominence reflects the ancient Egyptian cultural preoccupation with preservation of the body to ensure that the dead will live happily in the ever after just as they did in Egyptian society before death.

Greece

Ancient Greeks called one of their numerous deities of life and death Hades. Myths surrounding Hades answered many of the same questions that Anubis answered in the Egyptian myth: Who judges the dead and by what criteria? Is there a different destiny for the just and unjust in the underworld? When a person died, Hermes, the messenger of the gods, led the dead to the banks of the river Styx, from where Charon, the ferryman, would carry the dead across the river to the underworld island, also called Hades. Once in the underworld the dead person's life would be judged and determined to be good or bad. People who were good would go to Elysium, where they would be happy and have the possibility of rebirth into another body someday after drinking from the river Lethe, the waters of which would make people forget their previous life; however, people who were bad would go to Tartarus where they would endure punishments that fit their crime for all eternity.

The ancient Greek myth also accounts for why the seasons change. As the king of the underworld, Hades oversaw everything but he was an unhappy king because he had no wife. One day he saw Persephone, Demeter's beautiful daughter, and decided to kidnap her. Demeter, the goddess of fertility and growth, searched frantically for her missing daughter. When Demeter discovered that Hades had kidnapped her daughter, she demanded that her daughter be returned to earth. Unfortunately, while in the underworld, Persephone had eaten some pomegranate seeds; consequently Zeus determined that she had to divide her time between Hades and Earth each year, which accounts for the recurring, cyclical seasons of nature. When Persephone is on earth, her mother, Demeter, is happy and everything blooms; conversely when Persephone is in Hades, everything dies.

Haiti

Who has power over life and death? Is there anyone to help the deceased make the transition from death to destinies beyond? Adherents of voodoo, as it is practiced in Haiti, believe in a family of spirits called Ghede, a deity that embodies the powers of death and fertility. The father of the family, Io Baron, also know as Baron Samedi, was the first man to die after which he subsequently raised the rest of his family from the dead. His wife, Maman Brigitte, is spiritual mother to the innumerable members of the Ghede family, who are esteemed to become mind readers and who are extremely wise because their knowledge is an accumulation of the knowledge of all deceased people.

Ghede are psychopomps who control the eternal crossroads which everyone must cross to go to Guinee, the underworld. In the Haitian view of reincarnation, Ghede decide if a person in the underworld will be reincarnated as an animal and whether a sick person will die and join him in the underworld or recover and remain on earth. Therefore, in Haiti Ghede answer the question of who has power over life and death. Ghede are also the protectors of children, desiring that they should live a full and long life before they die. Ghede are the protectors of cemeteries and popularly represented by an undertaker, wearing all black, including dark glasses.

New Zealand

Why do people die and how did death enter the world? The indigenous inhabitants of New Zealand, the Māori, tell of Hine-nui-te-po, Great Lady of the Darkness, Great Woman of the Night, ruler of the underworld, and the goddess of night and death. Her husband is Tane, the god of forests and birds. Upon discovering that she was simultaneously Tane's wife and daughter, she fled to the underworld. While Tane remains on the earth to care for their children, Hine-nui-te-po, Great Woman of the Night, Great Lady of Darkness, presides over the underworld where she has been reigning since long before human beings came into existence. Death entered into the world through Maui, who tried to make humanity immortal by crawling through the body of Hine-nui-te-po, Great Lady of Darkness, goddess ruler of the underworld, while she slept. His plan was foiled when she awoke and crushed him with her vagina, distinguishing Maui as the first man to die and the one responsible for introducing mortality into humanity.

Finland

How does life after death feel? In Finland's pantheon, Tuoni and Tuonetar are the god and goddess that ruled over Tuonela, the land of the dead, where death is pleasantly described as a deep sleep for all eternity. Tuoni and Tuonetar rule Tuonela with their hideous, grotesque daughters Lovitar, Kipu-Tyttö, Kivutar, and Vammatar. All people, good or bad, go to Tuonela, which is described as a dark place, protected by a dark river. In Finnish mythology the world is formed from a waterfowl's egg, where the sky is the top part of the egg supported by a column at the north pole. The movement of the stars around the dome causes a great wind, which allows the souls of the deceased to go outside the world and enter Tuonela.

The universality of myths about deities of life and death, however defined, signals humanity's universal propensity to imagine, personify, and project anxieties and aspirations, dreads and dreams, visions and values into mythologies that address, entertain, and answer the most fundamental existential questions people pose about the relationship between life and death. Life and death are dualities, that is, polar opposites that are mutually exclusive categories. One is dead or alive, not both. Yet, in mythology, deities of life and death embrace, embody, reconcile, and resolve life and death into a single coherent world of meaning, even if that meaning is subject to competing and conflicting interpretations.

Demographic Transition Model

The demographic transition model, which is attributed to demographer Frank Notestein, describes population changes in fertility and mortality as societies make the transition from premodern to postmodern eras. In essence, the premodern regime of high rates of births and deaths changes to low rates of each through the process of modernization.

Much has been written about this topic regarding the pace, pattern, and causes of this transition. This entry first describes the basic demographic transition model and describes some of the different ways countries have moved through the transition. The next section describes the epidemiologic transition theory, which focuses primarily on mortality transitions. The third section examines the effect of the demographic and epidemiologic transition on population size and structure. Discussion then focuses on the possible causes for the mortality and fertility declines. The final section considers current and future trends in demographic and epidemiologic transitions.

Basic Demographic Transition Model

The basic demographic transition model is depicted in Figure 1. During the premodern times (Stage One) both fertility and mortality rates are high and fluctuating. In the second stage mortality rates begin to decline while fertility rates remain high. Stage Three is marked with declines in both mortality and fertility, and in the last stage both mortality and fertility rates are low.

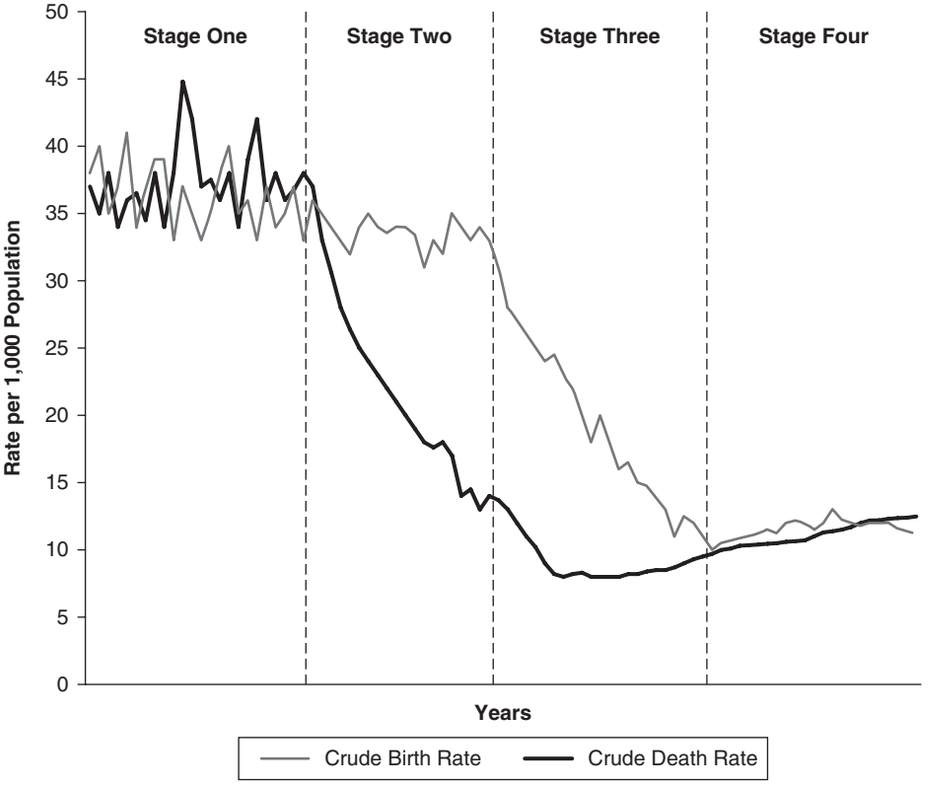

Figure 1 Demographic Transition Model

The demographic transition model was initially based on changes that occurred in Western European societies. For most countries large and irreversible declines in death rates occurred first, followed by declines in birth rates. No two countries have followed the same transition due to varied differences in patterns of marriage, fertility, and mortality, as well as differing cultural norms and values, at each stage. In Western Europe the mortality decline lasted from the latter part of the 18th century through the first half of the 19th century, whereas in less developed countries it began in the 20th century. The duration of the transition has also varied widely. The transition in Western Europe occurred over 75 to 100 years; in Eastern Europe, 20 to 25 years; and an even shorter period for those countries moving through the transition in the 20th century. In non-Western nations a decline in mortality has always preceded the decline in fertility. Indeed all countries that have gone through modernization have also experienced the demographic transition, and it has occurred under vastly different socioeconomic conditions.

Epidemiologic Transition Theory

The epidemic transition theory focuses on changes in the complex patterns of disease and mortality. Omran, the author of this theory, believed that demographic transition models overemphasized the role of fertility in population dynamics. His rationale was that in premodern societies the range of natural fertility is limited, based on the survival of women to reproductive ages, marriage patterns, and contraceptive practices, whereas the death rate could have no upper limit.

The focus of the epidemiologic transition is on shifts in disease patterns and causes of death, and the resultant impacts on life expectation. There are three basic stages in the epidemiologic transition: (1) the age of pestilence and famine, (2) the age of receding pandemics, and (3) the age of degenerative and "man-made" diseases.

The age of pestilence and famine was considered an extension of the premodern pattern of health and disease. In European societies this stage extended until the middle of the 18th century, and for less developed countries it has extended into the 20th century. Unpredictable and essentially uncontrollable major causes of death include epidemics, famines, and war. Other causes of death include parasitic and contagious diseases and malnutrition effects for children and tuberculosis, puerperal infection, and malnutrition effects for females. Infant and child mortality is very high with one third of the total population deaths occurring among children between the ages of 0 and 5 years. Females in adolescent and reproductive years have a higher risk of dying than do males in these ages because females are more vulnerable to infectious disease and also die due to complications associated with childbirth. In the age of pestilence and famine, average life expectancy at birth is variable and ranges from 20 to 40 years.

The early phase of the age of receding pandemics is characterized by fewer peaks and fluctuations in death rates, although mortality rates continue to be high. Infant and child death rates remain elevated, as well as deaths of females in adolescent and childbearing ages. As this stage progresses, improvements are first gained in maternal and adolescent mortality for females. Later infant and child mortality rates fall, in part due to increased health of females in childbearing ages. Life expectancy at birth steadily increases from 20 to 55 years.

The third stage reflects further reduction in death rates; thus more persons are surviving, especially to advanced older ages. Mortality rates steadily decline to below 20 per 1,000 members of the population. Child mortality accounts for less than 10% of the total deaths, and 70% of total deaths are to persons over the age of 50. Life expectancy at birth continues to increase to beyond age 70. Causes of death shift to chronic and degenerative diseases of old age as well as man-made deaths such as those due to environmental pollution, motor vehicle accidents, occupational hazards, and industrial accidents.

Population Effects of the Demographic and Epidemiologic Transition

During the early stage of the transition, both birth and death rates remain high. Many babies are born, but there are also many deaths from infancy through childhood and adulthood. There is little population growth during this premodern period because there is little difference between rates of births, which add to the population, and rates of death, which subtract from the population. In

most societies moving through the transition, death rates begin to decline while birth rates remain high. Thus, fewer people are subtracted from the population, compared to the persons that are added through births, so populations begin to increase in size. As birth rates begin to fall, the death rates are falling at a faster rate, so populations continue to grow. In the modern stage both birth and death rates become quite low and population growth slows, but population size is large due to the growth during the previous stages.

Accompanying the shift from high to low levels of fertility and mortality are changes in population age structures. With the declines in births and deaths in the latter part of the transition, there is the occurrence of population aging. This takes place when the age composition changes such that the older population increases its proportion relative to the total population and the proportion of young persons shows a concomitant decline. Linked with declines in death rates are improved survival chances, so more persons reach old age and total life expectancy increases.

The transition is seen as favoring the young, with greater survival rates, and also favoring females over males. Survival chances increase markedly for females through their childbearing ages such that by the last transition stage, females' age-specific death rates are lower than males for all ages. During the early stages of the transition, the sex ratio (i.e., the number of females per 100 males) indicates an excess of males. By the end of the transition, the sex ratio shifts with fewer males than females, particularly at older ages.

Causes of Declines in Mortality and Fertility Rates

Because the decline in death rates and birth rates were and are significant, considerable research has been conducted to ascertain the causal factors associated with the demographic and epidemiologic transition. The transition has occurred under diverse social and economic conditions. Theories regarding the declines in death rates have focused on a number of causal factors, which are discussed in this section. Specifically, much of the research on the demographic transition has focused on the vexing problem of explaining the fertility decline that typically followed the decline in mortality.

Mortality Transition

The decline in mortality through the transition has been linked with a number of causal factors. Death rates for premodern societies fluctuated because of unpredictable and essentially uncontrollable Malthusian positive checks of epidemics, famines, and war. There exists no unique cause or factor that affected all mortality declines. Because societies were experiencing declines in mortality in different centuries, the causal factors for the transitions differ as well. A combination of public health efforts, nutrition and diet, personal hygiene, current technologies in science and medicine, current understanding of etiology of diseases and illnesses, and a population's standard of living have had effects on the transition in death rates over time.

Improvements in agriculture and food production led to more stable and varied diets. One result was a reduction in deaths due to famine. Better nutrition also aids the body in fighting and surviving infectious and contagious diseases. Women in childbearing ages were healthier, and thus, were able to survive pregnancies and produce healthier babies.

Many municipal and public health efforts have led to declines in death rates. The establishment of stable governing bodies reduced deaths due to violence and civil wars between tribes, ethnic groups, or opposing factions. Governing bodies also reduced death rates through legislation such as the enforcement of quarantining of ships that might bring diseased immigrants to new environments such as the United States. Laws were also enacted to quarantine sick persons to their homes or to "pest houses" to isolate them from the rest of the population. The development of public works programs, such as cleaning streets of filth and, later, the introduction of piped clean water and sewer systems, served to reduce death rates in urban areas.

Increased knowledge about the causes and treatment of infectious and contagious diseases, such as inoculation for smallpox in colonial America, and vaccination for other diseases in the 19th and 20th centuries has reduced epidemics through time. Scientific and medical advances, such as germ theory by Louis Pasteur in the 1860s and the study of bacteria by Robert Koch in the 1890s, led to a greater influence of medical knowledge and practice on death rates in the 20th century. Medical research and discoveries continued

throughout the 20th century, such as the discovery of penicillin in 1943 and other antibiotics, which greatly affect the transitions in mortality decline in non-Western countries.

Fertility Transition

It should be noted that premodern fertility rates varied among countries due to differences in the age at first marriage, the proportion of childbearing women who were married or living in a union, norms and practices regarding nonmarital fertility and childbearing, differences in breastfeeding practices, and other norms regarding sexual intercourse. Thus there were large variations in natural fertility, or the number of births to women who were not consciously trying to reduce births.

Social and cultural factors contributed to changes in Western European fertility. The marriage patterns changed to later ages for marriages and high proportions of females who remained single. The spread of fertility decline was quite rapid in Europe in that, excluding France (whose fertility decline started much earlier), 59% of the fertility decline occurred between 1890 and 1920. The cultural diffusion of knowledge and norms regarding fertility behavior has been noted due to similarities in fertility patterns among contiguous groups sharing a common language, religion, or ethnicity. There also were ideational changes that accompanied the decline in fertility, including a move toward secularization, greater egalitarianism, and individualism within the family as the result of a shift from extended to nuclear families and the change in the status of women. Decisions regarding childbearing (e.g., timing and number of children) shifted from the community to individuals within a marriage. The introduction of formal education, particularly for girls, and increasing employment opportunities for women have reduced fertility rates by postponing age at marriage and the timing of first births.

Economic factors, alone and in concert with social factors, also came into play. Age at marriage was, in part, determined by when a couple had the economic resources to establish an independent household. The value of children changed such that children switched from being assets to expenses, thus the rational decision would be to reduce the number of children produced. In premodern societies children contributed to the family with work, money, and other resources. With modernization, change in place and type of work (from agriculture to industry), and the development of more formal education, children become expenses.

Birth control techniques did not have a great effect on the change in Western European fertility. Most contraceptive methods, except modern chemically based methods such as the pill, have been around since ancient times, although the knowledge was sparse and unsystematic. However, in the 20th century the introduction of effective family planning programs in developing countries resulted in fertility decline regardless of the country's level of modernization. Once there are increases in the number of couples practicing family planning and fertility control, marital fertility declines and the trend becomes irreversible. Fertility decline has now been observed in all regions of the world.

Future Stages of the Demographic and Epidemiologic Transition

The demographic and epidemiologic transition models have assumed that there would be a stabilization of low birth and death rates at the end of the transition. Instead, birth rates in most European countries have dropped below replacement-level fertility, which is 2.1 children born per woman, and life expectancy has continued to increase.

A second demographic transition model has been developed to characterize the changes in Europe and Japan regarding household structures, fertility, and marriage patterns, which have occurred in the last third of the 20th century and into the 21st century. The trend is characterized by the further postponement of marriage, an increase in cohabitation, delayed childbearing, out-of-wedlock childbearing, a rise in divorce and separation rates, and increased single-parent families. Household size has decreased, and there are more adults living alone. Causal factors for such changes include the shift from an emphasis on physical and economic security to an emphasis on self-expression, self-fulfillment, and quality of life. This has led to total fertility rates for women to be around 1.5 or less. There are major concerns regarding the size and composition of populations given the reduction of births.

The United States has followed trends of cohabitation and marriage and fertility postponement

similar to those of Europe; however, fertility rates have not fallen far below replacement levels. One explanation is the heterogeneity of the population, in part due to immigration of persons from countries with a culture of higher fertility levels. There also is heterogeneity across regions of the United States regarding patterns of cohabitation and the timing of marriage and first births. However, studies show that the United States is following the second demographic transition model and that fertility will also decline in the future.

Death rates have declined further than initially imagined by the epidemiologic transition theory. Improvements in life expectancy at birth were expected to slow after reaching 70 years, and declines in mortality rates were expected to come to a halt or be reversed. Instead, total life expectancy has continued to increase into the 80s for a number of countries, including Japan, Singapore, Sweden, and Switzerland.

There have been suggestions that an additional stage should be added to reflect increased rates of survival throughout the 20th and into the 21st century, particularly for older persons. Deaths due to chronic conditions, such as heart disease, have declined at a greater rate than first imagined. Models of a new stage in the epidemiologic transition primarily emphasize that causes of death complicated by social and cultural factors will dominate. Lifestyle behaviors such as smoking, diet, and exercise will have an important influence on mortality rates. But the patterns of lifestyle behavior are not uniform across countries, and thus, patterns of mortality may differ as well.

Another influence in the new stage of mortality rates is the emergence of more deadly infectious diseases, such as HIV/AIDS, SARS (severe acute respiratory syndrome), Ebola virus, and avian (bird) flu. The 20th century witnessed a decline in deaths due to infectious diseases, but these new viruses are more difficult to identify and control. In addition, more drug-resistant strains of infectious diseases, such as tuberculosis and malaria, are emerging.

One final factor that will also affect death rates is population aging, which is a worldwide phenomenon. The proportion of older persons is increasing due to both lower birth rates and longer life expectancy. Populations will reach a point in which death rates will increase because more of the population will be in the older age brackets, which carry the greatest risk of dying.

Denial of Death

Visiting a rural cemetery that contains 18th- or 19th-century tombstones reminds us of the then high mortality rates of infants and children. Before the advent of hospitalization of the sick and dying, death was a normal part of family life. Birth and death were realities seen in every household, both among farm animals and people. Death was an important event in the life of a family, but it happened frequently enough that it was seen as something that happens to everyone, not as a significant catastrophe. Philippe Ariès suggests that death simply reflected a normative life span experience, in his words, a collective notion of destiny. As humanity lived through the Industrial Revolution, urbanization, globalization through two world wars, the isolation of nuclear family mobility, and

the medicalization of all maladies, there has been an increase in anxiety and angst around the end of life. Young people are increasingly removed from any exposure to, or experience with, the elderly and the end of life. Death is viewed as an inconvenient enemy. Particularly in the 20th century, denial as the dominant coping response became common. Ariès traces this new attitude as having begun in the United States and since spread to Europe and all of Western culture. Today, the denial of death is frequently linked with youth-oriented culture, but this reflects only one perspective of the denial of death. The denial of death can be understood as a cultural phenomenon, a personal coping strategy, and also a life span issue. From these three vantage points this entry takes on different issues.

Cultural Phenomenon

The death-denying attitude in American culture became pervasive during the latter half of the 20th century. In the early 1900s, most deaths occurred at home, as the result of accident, trauma, or acute infection. One hundred years later, most deaths occur in hospitals and skilled nursing facilities, as a result of long-term chronic conditions including heart disease, cancer, and dementias. Medical breakthroughs in diagnosis, technology, and biological agents, including antibiotics, have revolutionized medical care and reinforced the myth that death can be defeated. In the *Experience of Dying,* E. Mansell Pattison notes that the care of persons who are dying has been handed over to physicians and hospitals. However, when surveyed, physicians are more likely to be more uncomfortable around death than are most other health care professionals, seeing it as a failure in their expertise rather than a natural part of life. The denial of death is seen in medical settings when staff avoid the dying patient or adopt a not-on-my-shift mentality. Care is relegated to the intensive care unit where the family is marginalized and the dependence on technology is reinforced. Most health care dollars are spent in the last 6 months of life. Death is understood to be giving up or failing rather than completing the life course. It is seen even more dramatically in long-term care facilities, when the death of a patient is noted only by the removal of personal things and an empty bed. Returning to work and finding one's patient has died and the bed has already been filled by another resident is a common experience for nursing home staff. One nursing home had an old elevator at the back of the building that was too old to be used by residents, but because it went directly to an area near the back door, it was used to move bodies so that they could be picked up by a funeral home. The noise of this old elevator was the only sign to the residents that someone had died. The denial of death has, at times, resulted in institutions either not wanting to offend or wanting to protect residents and staff from grief. However, by denying death, a new form of fear is created, the fear that one will die and no one will notice.

Personal Coping Strategy

Since the publication in 1969 of Elisabeth Kübler-Ross's seminal work on anticipatory grief, the field of thanatology has seen a proliferation of models of grieving. Most include at least some adaptation of the Kübler-Ross stages of grief model beginning with denial. Authors and practitioners recognize that a common response to loss is the attempt to maintain homeostasis through rejection of the scope of change. Even William Worden's theoretical framework around the tasks of grieving focuses first on the importance of accepting the reality of the loss, in response to the assumption that failure to accept the reality of the loss is the normal first response. Unfortunately, some writers in the area of death and grief and many consumers of medical care and bereavement services have written about this denial of the reality of the loss as pathological or negative. In reality, it is normative and protective, unless taken to an extreme. Similar to any other defense mechanism, survivors' denial of death can protect them from experiencing too much reality too quickly. Like a car airbag that activates when the car is hit, denial cushions survivors from the full impact of their loss. This protection allows survivors to negotiate complex societal requirements in a time of crisis while maintaining some homeostasis. Like any other phenomenon of health, denial in moderation is a healthy mechanism. Denial that persists for months, that does not respond to the work of grief, or that becomes increasingly

delusional requires professional intervention. However, practitioners must be very careful not to overpathologize this phenomenon. The mind is able to recall shared experiences with enough power and reality to respond physiologically. So, the common experience of seeing or hearing the deceased in the immediate days and weeks after the death is rarely indicative of psychosis and should initially be normalized as much as possible.

Developmental or Life Span Issue

The experience of death denial in children and adolescents is a developmental phenomenon, particularly in industrialized countries where medical advances have increased life expectancy and changed the death experience, from acute to chronic illness and from home to institution. Children and adolescents are rarely exposed to end-of-life issues, in part because nuclear families are disconnected geographically and experientially from older family members. Many children and adolescents have never visited a hospital or nursing home; nor have they experienced the death of anyone close to them. Their exposure to death occurs through television and movies in which the person who died might be on another show the following day or week. These experiences reinforce the natural developmental belief that children and adolescents are invincible.

For children younger than 3 years of age, there is very little knowledge of death. Infants respond to the emotion and grief of significant adults around them. As they develop object permanence, they respond to the absence of love objects but do not conceptually understand death. From 3 to about 5, children have a difficult time understanding death as they are not cognitively able to process the construct of death as the ending of life. They understand such concrete issues as broken or out of reach, but in either case, it is the obligation of the parent to fix the situation. Sigmund Freud understood this to be a part of the development of the permanence of the objects around the child. Latency-age children and preadolescents begin to understand the permanence, universality, and irreversibility of death but resist the notion that death is something that can happen to them. This attitude deepens and intensifies in adolescents and young adults, whose engagement in high-risk behaviors is often a reflection of a belief that they are invulnerable. This death denial has been credited with increases in high-risk sexual behavior in an era of HIV and AIDS; high-risk, mind-altering drug use; and, interestingly, with valor in military combat.

In the lengthening middle years of the life cycle, the experience of death denial is manifested in a variety of ways, from the myriad euphemisms used for death to the relatively new phenomena of cryonics. Conversations about death and dying are softened by the use of words like asleep and passed away. Before burial, bodies are first prepared with makeup to look normal and positioned to appear asleep in caskets that, in part, are marketed by the comfort of their mattresses. In the growing phenomenon of cryonics, bodies are frozen for preservation and awakening at a time when the cause of death can be reversed.

At the other end of the life cycle, studies of older adults have consistently found that seniors are less likely to be afraid of death and more likely to be afraid of how they will die. Fears of suffering, of intractable pain, and of meaningless and purposeless days are the focus of many older adults. The process of dying is significantly more terrifying than the actual prospect of death itself. Victor Cicirelli points out that there is a distinction between body loss as a physical entity and mental or spiritual loss as emotional and spiritual entities. The prospect of body loss, which is another way of referring to how the body will be lost, can be terrifying to older adults. However, the prospect of mental or spiritual death may not be as worrisome. It is not unusual for older adults to engage in denial of death to protect their children and grandchildren from an emotionally upsetting topic and protect themselves from a difficult discussion.

This life span perspective suggests that the denial of death, a common phenomenon, is experienced differently in the various development stages. For young children, death denial is related to their inability to grasp the concept of the permanence of death. At such time as the child can comprehend abstracts such as permanent loss, then a denial of death that stems from a complete fear of death may develop. This is seen both in adolescents, who cope by believing themselves to be invulnerable, to middle-aged adults, who fear the interruption of death. This denial continues until old age, when in another transition, the older adult

moves from being afraid of death to being afraid of how they will die.

Conclusion

In summary, the denial of death can be understood as a cultural phenomenon, a personal coping strategy, and a life span issue. Like other social sciences, modern thanatology has rejected the singular concept of denial of death. Denial of death is ingrained in the elements of our modern society, in which physicians view death as a failure of their art. Additionally, when seen as a step in the process of coping, denial of death is a transient stage, something to pass through, not a permanent part of the human landscape. When viewed through the lens of human development, denial of death is an evolving experience based both on cognitive capacity and interrelational dynamics. Practitioners need to examine the evidence based on how the client sees death to determine how each of these three perspectives will be most useful. Essential to practitioners is the understanding that denial of death is pathological only when exaggerated beyond the norm of coping mechanism and beyond the scope of therapeutic support.

Depictions of Death in Art Form

Death has been a topic of depiction as every culture develops a way of representing the deceased. As this topic concerns representations of death in art form, it is most illustrative to focus on Western culture where an established definition of art exists and is influenced by the social and religious environment. In this view the relationships between the human experience of death in social context and their expressions in art form can be observed.

This entry describes the primary methods used to depict death throughout the centuries. These different approaches are considered within a global perspective consisting of establishing the links between this practice, social change, and the permanence of religious conceptions.

Different Means of Representation of the Dead

Two distinctions of the representations of the dead can be offered: the *ad vivum* (prior to death) depictions and the *postmortem* (after death) depictions. However, each representation may be viewed in the same Christian conception of death.

During Renaissance England and France, the tradition of the king's double corpse appeared: the real one, putrescible, and the other, immortal effigy. Clémence Raynaud indicates this was made by artists who used a mortuary mask, made from a postmortem molding of the king's face. Use of this effigy was determined by political events and social need. As one example, it had to symbolize the permanence of the king's life and the continuity of the political body during the transmission of power. This ritual of transmission could last several weeks, and the effigy was used in order to avoid any semblance of a hiatus in power.

During the Renaissance the fashion of recumbent effigies, which adorned the graves of royal and aristocratic families, also appeared. These effigies were a faithful representation of the dead, generally portrayed in a state of sleep, thus creating the illusion of restful death. These figures also were represented with opened eyes, thus symbolizing the living. The position of the effigy with joined hands was suggestive of prayer, thereby attesting to the religiosity of the deceased.

At the end of the 14th century, a new recumbent effigy, the *transi*, represented the deceased in a state of decomposition. This fashion is linked with the development of the dance of death (*danse macabre*) theme, inspired by the occurrence of great epidemics and used by the church to influence the population through spreading ideas that led to the fear of death.

About this same period another depiction of the dead appeared in Poland: the coffin portrait, a hexagonal shaped portrait fixed on the side of the coffin. Representing an idealized image, this portrait was a way to identify the deceased physically and socially, especially among aristocratic families. Przemysław Mrozowski indicates this portrait, as an ad vivum depiction, was intended to display death not as the end of life but as a transition from one state to another. Thus, the coffin as an element of the liturgical ceremony became representative of the permanence of life beyond biological death.

A new form of funeral portrait first appeared among the Flemish bourgeoisie during the 16th century as well as in France, England, and the United States. As Emmanuelle Héran explains, when a family member was lost, a painter was asked to depict the dead in his or her bed. Such portraits can be considered expressions of *ars moriendi*. Indeed, they are depicted after the fashion of those representations of the deaths of Jesus Christ, the Virgin Mary, and the saints. Philippe de Champaigne played a prominent part in the diffusion of this Flemish practice in France, especially among the partisans of Port Royal. Funeral portraits were initially public but became progressively integrated into private areas.

From this practice emerged another art form, namely, the mortuary mask. Philippe de Champaigne, in responding to a request of the partisans of Port Royal, depicted postmortem portraits and, in so doing, he used a mortuary mask of the deceased as a template for paintings. The mask of Blaise Pascal, who died in 1662, was made for this purpose. In the 18th century, France, Germany, and England also began to use this technique, not as a template but as a representation of the deceased. This method was completely integrated in the 19th century to be followed by Italy, Russia, and the United States. Thus, we can find mortuary masks of Dante, Puccini, and Tolstoy, among other great characters. In France, the famous Madame Tussaud made masks of Marat and Robespierre, but it was in Germany that the production was most important. Among the gentry the practice spread to the artists and intellectuals such as Goethe, Beethoven, and

Recumbent effigy of the Queen Jadwiga in Wawel Castel

Lessing as well as political leaders including Frederick II of Prussia. Even if the practices of mortuary masks and postmortem paintings were simultaneously in use during this time, the mask had a great advantage in that it was infinitely reproducible and easily transported.

In the context of democratization of postmortem portraits, photography was used as a new medium for the depiction of the dead. Considered to be a faithful reproduction of reality, initially the pictures were used by painters as models but, progressively, they became a new way of making funeral portraits. Bourdieu noted the success of photographic method functions, as with other representations of the dead, to solemnize and eternalize the great moments of collective life. Furthermore, this method had a lot of advantages compared to the effigies, statues, paintings, and masks. It was possible to make portraits more realistic and much more quickly, and the pictures were infinitely reproducible and easily transported. The success of this practice also resulted in cost reduction. Indeed, everybody could afford such portraits. However, it cannot be concluded that postmortem pictures were used only by common people. Indeed, postmortem pictures of famous people such as Victor Hugo, Marcel Proust, or Gustave Doré also are known to have been created by Nadar and Man Ray, whereas portraits of common people were made by anonymous photographers. If the former stayed in a formal artistic way of making portraits, the latter developed as a kind of popular art.

Social Context of Representations of Death

The progression of the funeral portrait was determined by its democratization. Previously reserved for the saints and then for kings and aristocrats, its use was extended to bourgeois families and to great national figures. This democratization and personalization of the postmortem portrait reflects the transformation of Western societies. The development of the bourgeoisie and then the French Revolution shaped new political and social ideals, allowing the appearance of egalitarian values and of individualism to become an important part of the cultural ethos.

To understand the success of the funeral portrait, it is necessary to focus on the relations of those societies with death. In France, cemeteries were completely integrated into social life until the 17th century when the Church forbid what was then called "unholy behaviors." Even as the French Revolution implied a change in the perception of death, funeral portraits were still in use. Indeed, the increased importance of hygiene and sanitation, along with a declining importance of religion, led to the relocation of cemeteries outside of city boundaries.

This distancing from the reality of death was temporary, and the pomp of the ancient regime reappeared during the 19th century. Grief became a social event that focused on the deceased's bedroom. People became accustomed to the reality of death, and it was usual to visit the Paris catacombs or the public mortuary as a form of entertainment. In this context, death was an everyday reality, which could even appear as a show. Proximity to the dying and the dead lends some understanding of the motivation of people to order such portraits. This event caused community members to gather around a deceased person, who embodied the social essence of ars moriendi (the art of dying a good death) and thus ensuring one's eternal salvation. In addition to the social context, the traditional depiction of the dead was characterized by the Christian conception and practice. Indeed, the tradition of making portraits of the dead was inscribed in the continuity of religious portraits of the saints and of Christ. When the living representations of the dead suggested the permanence of life after the occurrence of death, the postmortem representations were expressions of the ars moriendi as determined by the concepts of judgment, heaven, and hell. These supported the pastoral play based on the fear of death. Furthermore, the Christian concept of the individual offers a more complete explanation of the tradition of depiction of the dead. Accordingly, the soul and the body are the components of individuality, even if a distinction is made between them. Indeed, the soul has to master and transcend the body, which is considered the

source of sins. After death the body is disintegrated and the soul is supposed to stay alive until the Last Judgment when believers will resuscitate. Even if the concept of resurrection is considered as a metaphor, Christian death does not imply a dispersion of the components of individuality but a reunification in another dimension. Thus, the body stays an important reference in the definition of the individual during one's life and after death. So the depiction of the dead underscores not only the permanence of life but also the permanence of individuals among the living.

Depictions of Death in Sculpture and Architecture

The depiction of death as both a physical reality and as an abstract concept has been a preoccupation of sculptors, builders, and architects for centuries, particularly in relation to gravesites and funerary monuments. Since ancient times nearly all cultures have developed rituals and beliefs surrounding the death of a person. In Western civilization death has often been personified in art. Other ways of depicting death range from allegorical figures (a human figure that represents or embodies an abstract concept such as hope or faith) to representations of the dead body. In architecture, certain types of structures and monuments, whether at gravesites or, for important or significant people, in public spaces, have also developed into a visual "language" of death. Much of what we know today about the way people have thought about or considered death in the past comes from the study of funerary and commemorative art and architecture.

Depiction in the Ancient World

In ancient Greece, death and life became personified—that is, ascribed a human figure and personality. Life was considered as feminine, and death as masculine. In classical Greek mythology, the minor god Thanatos was the personification of death and mortality. Thanatos was the twin brother of Hypnos, or sleep. The twins were the sons of Nyx (night) and Erebos (darkness). In ancient Greek sculpture Thanatos was often shown as a winged youth (or angel), often with his twin, as a mediator between two gods negotiating for a mortal soul, or at the scene of a death (e.g., a battle scene). Thanatos was not seen as a fearful or tragic figure; rather, Thanatos (from which the word *euthanasia* is derived) was often depicted as a peaceful, serene presence. Thanatos's presence on a sculpture did not imply that the work was necessarily a funerary monument. The Greek tradition of death as a winged figure, and one often synonymous with eternal sleep, is one that influenced many later artistic representations of death. Later, in European depictions of Thanatos, he is

often shown holding a downturned or extinguished torch, symbolic of a life that had ended. Ancient Romans did not produce specific sculpture depicting representations of death, although these occasionally appeared in mosaics and other artistic forms.

Architecture and tomb structures related to death in the ancient world came in many different forms and sizes. It is important to note that death-related architecture never depicted death in the same way that sculpture did, but acted more as an indication that they were connected to, or housed, the deceased. Some structures were meant to accommodate individuals, others for large numbers of persons, for example, multiple generations of a family. In general, the large monuments and structures that have survived were almost always erected for rulers or powerful persons. Pyramids—such as the famous ones at Giza—are the most recognizable and enduring form of ancient Egyptian architecture; they mark the resting place of the pharaoh, considered the embodiment of a God on earth. Pyramid tomb shapes were later used in ancient Greece and Rome. Temple structures were popularized in ancient Greece, while mausoleums—often in temple shapes—were popularized in ancient Rome. In the ancient Mideast, characteristic tomb and mosque shapes were rounded. Some Asian cultures favored pagoda-like structures. All of these cultures and countries, however, borrowed ideas from each other, and myriad variations can be found everywhere throughout history.

Medieval Period

The Middle Ages (ca. 500–1400 C.E.) were a particularly rich era in memorial arts. As Christianity spread and flourished during this period, the concept of *memento mori*—a term coined in ancient times—became dominant. Loosely translated from the Latin, the phrase means "as I am now, so too you shall be," referring to the fact that everyone must eventually die, regardless of wealth and status. Christian religion emphasized salvation of the soul through good deeds and living a pious life, so memento mori served a moralizing purpose.

Despite the leveling nature of death, status was still indicated by the size and quality of one's tomb (or lack of one). For those who could afford it, however, there were options. One was commissioning a stylized portrait figure engraved on a brass plate. Though not technically sculptural, making these required the skill of the engraver as well as the sculptor, two often interrelated skills.

Persons of higher status and wealth could commission full-length recumbent portrait figures of themselves atop or near their tombs. These are fully realized three-dimensional sculptures, often of a husband and wife lying or "sleeping" under an elaborate canopy, occasionally with other references to their earthly lives—such as the inclusion of a pet dog—as part of the scene. These recumbent figures usually express serenity and confidence that through their pious lives, their souls' salvation has been assured. An example of this type of sculpture is the pair of recumbent figures of Charles III, King of Navarre (d. 1425) and his wife Eleanora of Castille (d. 1416) in Navarre, Spain.

A particularly stark type of monumental sculpture was the "cadaver tombs" that were popular for those who could afford them. These were popular especially in England, Italy, and France but were produced elsewhere in Europe as well. Only the high-ranking or very wealthy could afford to have these made, as they required expensive materials and highly skilled artists to produce. A cadaver tomb is a monument in which a full-length sculptural representation depicts the deceased either right after death or in some advanced state of decay. Emaciated corpses or skeletons, sometimes shown with the worms and other animals that would feed on the remains, were graphic and realistic depictions of the transience of life and earthly pleasures, and of the inevitability of death. These were also reminders that death would overlook no one and that there was a vast difference between dying a "good death," that is, being assured of salvation and an eternity in heaven, and a "bad death," one in which salvation was probably out of reach, therefore dooming the deceased to hell. Only a virtuously lived life could ensure the salvation of one's soul; presumably cadaver tombs also acted as motivators of the very real dangers and horrifying consequences of dying a "bad" death. Examples of well-known cadaver tombs include that of Cardinal Jean de Lagrange (d. 1402)

in Avignon, France, and of William Sylke (d. 1502) in Exeter, England.

Apart from Christian concepts of death, another major factor affecting depictions of death during the Middle Ages was the devastating effects of the plague. The plague, or black death, which ravaged Europe at various times between the late 14th and 17th centuries and in many cases decimated entire populations, also contributed to fearful depictions of rotting corpses, known as *transis* in art. Although plague victims were rarely depicted in sculpture, their representations in paintings and engravings of the time—for example, the dance of death images—had a significant impact on other visual arts.

The Renaissance

The Renaissance, a period of cultural, artistic, and architectural achievement that remains unmatched to this day, produced some of the finest sculpture ever known, by artists such as Michelangelo and Leonardo da Vinci. This was also a period during which artists emerged from the relative anonymity of the medieval guild system and began to cultivate their own patrons and sign their own works.

Artists who lived during the Renaissance (literally "rebirth") found renewed inspiration in themes from antiquity. In architecture and sculpture, church and tomb structures based on ancient Greek and Roman temples were the norm, while sculpture resurrected the realistic representation of the human body and the portrait bust, among other devices. Most sculpture commissions for Renaissance artists were funerary monuments. Depictions of death developed into a particularly rich variety of tomb sculpture. Since the wealthy were usually buried inside churches, large and elaborate interior monuments were the norm, especially if the family could not afford to build its own private chapel. Architecture to house the deceased was usually in the form of a church or, borrowing forms from antiquity, a temple or mausoleum.

Death as a skeleton or rotting corpse continued to influence generations of artists and sculptors; depictions of these popularized during the medieval era remained common, especially for wealthy or high-born clients. A newer, less frightening conception of the skeleton appeared at this time: the winged skeleton. Gian Lorenzo Bernini, one of the Renaissance era's most celebrated artists, designed many different funerary monuments, and his work was extremely influential. An example of Bernini's work is the Merenda monument in the Church of San Giuseppe alla Lungara (Rome), which shows a winged skeleton ascending while displaying a large rippling "banner" that contains all of the deceased's biographical information. Another Bernini-designed monument is the Vallini monument in the Church of San Lorenzo (Rome), which shows an ascending skeleton holding a cameo portrait of the deceased.

Monuments to deceased popes were important and highly visible. These, again designed by highly influential artists, often memorialized such men by showing them in full three-dimensional form, sometimes as they had appeared in life, for example, praying on their knees, but often on their deathbeds, much like the recumbent styles of the medieval period. Monuments dedicated to deceased popes were extremely elaborate, often reaching tremendous heights; for example, St. Peter's Basilica in Vatican City has a cavernous interior and extremely high ceilings. These monuments comprised many different parts and sculptures, often in differently colored marble and always exquisitely carved. Sometimes depictions of death were subtle, such as the recumbent figure; other times figures such as a skeleton holding an hourglass or participating in the dance of death, were more overt reminders of memento mori, the fact that even popes are mortal. Not all great artists called upon to design tombs for a pope chose such graphic representations, however—for his design of the tomb of Pope Julius II (1542–1545, Rome), Michelangelo chose the mythological figure of Moses from antiquity to symbolize the power of the pope. Other popular topics for tomb sculpture included angels, saints, and the Virgin Mary.

Beyond the Renaissance

Since the Renaissance, depictions of death in Western sculpture and architecture have primarily relied on motifs and representations popularized throughout history. In colonial America, Puritans

used variations of memento mori iconography, such as skeletons with scythes (i.e., the Grim Reaper), skulls and winged hourglasses, all on slate gravestones, to ensure that observers understood that time would not stand still for anyone. By the late 18th century, however, depictions of death—now mostly in white marble, a new material in America but long favored in Europe—took a very different turn, emphasizing a more hopeful spirituality and a collective belief that every individual could ascend to heaven. Depictions of skulls and skeletons lessened in favor of a wide variety of motifs, including sleeping babies, cherubs and angels, and botanical motifs. Classical motifs such as downturned torches, funerary urns, and mourning allegorical figures were also popular, particularly in 18th- and 19th-century Europe and 19th-century America. Architectural structures to house the deceased still borrowed from antiquity, most notably in the forms of mausoleums, often designed to look like miniature Greek temples or churches.

Since the 19th century in Europe and America, graphic depictions of death in sculpture have virtually disappeared. In cemeteries, granite stones with generally pleasing motifs have replaced earlier, more elaborately carved slates and marbles. Contemporary works of art—most notably, Damien Hirst's controversial "For the Love of God" (2007), a platinum cast of a human skull (with real teeth) encrusted with over 8,600 diamonds—occasionally use death or memento mori imagery, but usually for publicity or shock value. In general, depictions of death today in art are uncommon.

Depictions of Death in Television and the Movies

While television and cinematic film are well recognized as the medium with the greatest communication impact across the globe, only recently have the various forms of death depicted in these formats received serious consideration. Because death is no longer a taken-for-granted finality to life, it has become a focus of considerable research and debate. This developing field proffers an understanding that death is not only the underlying driving force in nearly all cinematic narratives or television genres, but its various forms and portrayals are a psychological response to a deep-seated human need to confront the concept and inevitability of death.

Interaction with movies and television is a viewing experience that is much more complex than simply watching for enjoyment. These visual texts "talk" about issues of identity at both a personal and a social level. It is the act of viewing that most fully provides a candid experience in regard to how people come to grips with the concept of the finality of identity through death as well as the related fear of abandonment.

It is the concept of death as portrayed in both the large- and small-screen experience that has assumed an important point of reflection and social comment. Sociologists tell us that the current number one fear across the globe is related to our inability to articulate our understanding of existence. In other words we experience some difficulty in answering the philosophical questions of who or what we are, and how we will end up. The concept of death is important to this understanding because to answer questions relating to life and death, it is critical to achieve some understanding of the concept that defines our end.

Visual experience plays an important function by providing an ending and by revealing myriad forms that deal with death as the ultimate finality and the finality of earthly existence. From the very first movies that dealt with the death of the Christian messiah to the 21st-century cinematic and televisual themes of the undead, the living dead, murder, suicide, and the concept of a good death, a consistent theme in this viewing experience is that death is both an ongoing source of fear and fascination.

Although no single media definition of death can sufficiently capture the full meaning of cultural mores, myths, and metaphors that reveal our relationship to death, death often is characterized by visual metaphors. The most common of these is the Grim Reaper, the dark, hooded, unknown, menacing being. This visual metaphor represents the ultimate threat to human existence and that point of life beyond which there is no comprehensive understanding. In the following sections we deal with the concept of death by a discussion of the organizers of menace.

The Death of Individual Identity

One's reflections on philosophical questions relating to self within the context of everyday life underscores the self-awareness and knowledge that life is finite and that answers to existential questions of self may remain unanswered. Some analysts recognize that this fear of death becomes crystallized in the consciousness around the age of 3 years. The reality of death as the ultimate form of the unknown is a constant throughout life. As such, our television and movie viewing experiences allow us to see, firsthand from an early age, actual corpses. These physical aspects of death have always been seen as a typical source of abject fear in that the corpse is reminiscent of life. The physical nature of the corpse reinforces the possibility that life is simply mayhem that leads to total abandonment.

Whereas movies from the 1990s, such as *Philadelphia, The Sixth Sense,* and *City of Angels*, offered elements of hope with regard to death, more recent movies have returned to a more pessimistic perspective reflecting the uncertainty the concept of death of the individual brings. These themes of insecurity are epitomized in the movie *The Departed* (2006), wherein the death of those seeking to engage in fighting corruption and crime are cast in similar forms of capricious finality as those who are selfishly destroying all in their path for self-gratification. The final metaphoric scene with a rat in the foreground of the Massachusetts State Legislature gives voice to the futility of making sense of an individual life given the inevitability of death.

Just as the human condition is haunted by this fear and the apparent inability to find a suitable answer as to the nature of self, so it becomes a more concrete visualized image on the screen, through ongoing representations and iterations such as the slasher films, *Frankenstein* motifs, and Dracula forms. The Count and his vampyric minions are at the same time both alive and dead, thus placing themselves outside of the natural realm and apparent cycle of existence that is unknown.

The fascination-with-death motif deals not only with fear but with the fascination with death itself. The entire host of the cinematic and televisual death scenes, from the living dead and zombies to the fascination with Egyptian mummies, not only serves as a threat to humanity but also reveals the obsession with the fears related to the transformative process of death. Through observing these "death transformed" creatures, it is possible to comprehend the prospect that death is a developmental process that involves physical transformation.

In real life we experience a single point of death, but with movies another sense of menace is revealed, namely, decomposition. Although many forms of death occur in film and video narratives, it is only the zombie, mummy, and Dracula motifs that explore our fear of what happens to the body after death. And it is through the horror films that this degeneration process is visually explored. Bandages, bites, and blood mark the corpse as being in the process of degeneration, which is the first form of the radical trajectory that occurs after death.

Death as Social Disconnection

The process of death also involves the severing or disassociation of a supportive psychosocial network. Thus, the forms and points of death as portrayed in the movies are often couched as the disengagement of an individual's social and cultural identity.

Death of the central characters in the multimedia experience is rarely defined or revealed on an individual level. Instead it is typically connected to a context involving friends, loved ones, family, societal connections, and a broader cultural fabric. With the exception of horror films, scapegoat themes, and elements of suicide, overwhelmingly individuals resist death in the movies and television. Thus, by its very participatory nature, the visual narrative not only allows the viewers to revisit the notion of death as physical and psychological disconnection from the here and now but also provides an opportunity to revisit this disconnection point within the framework of societal and cultural immersion. The movie *Babel* touches on the all of these issues as well as from different cultural standpoints through the use of a pastiche of intertwined vignettes. Although the differences in death are briefly touched on in this movie, the connecting thread is the notion that the most powerful disconnecting force death brings is the severing of our social familial fabric and our fear of being alone in this world and in death.

The experience in a darkened movie theater has been compared to a "dream-like" state which, in the case of death portrayals, provides the viewer with an even more reflective opportunity to begin to allow both personal desires and subconscious fears to surface. The viewing of death and all the facets of dying provides a context for the darker elements and fears to emerge that relate to how we perceive we are connected to others. Thus death as portrayed in the movies reveals the death process as a raft of issues including morality, emotional states, and fulfillment within a familial, social, and cultural context.

Research reveals that the viewing of death in the movies and television represents an ongoing experience that has replaced the typical religious rituals of the past. But the death experience is rarely explained because the whole point of these portrayals is to reveal an example of personal and societal incongruity and inconsistency. This connection between lack of full explanation but explicit portrayal of death in action is typified in the Coen brothers' 2007 movie *No Country for Old Men* (2007). While the apparent unpredictability of life and its relationship to death are explored in a similar fashion to *The Departed,* this film also deals with the futility of finding meaning in life itself given that death comes to all. The film ends with the main character preferring to accept a quiet good death as opposed to the violent death that has occurred all around him as he sought to forge an ethical path in his world.

An interesting death perspective that these acclaimed films also bring to light is the relationship between death and screen violence. Current research had identified that despite current societal concerns, there is little supporting evidence that the viewing of death and violence actually produces ongoing aggression in individuals. It has been suggested that the viewing of death within scenes of hostility is a necessary part of human development and that if avoided, these aspects will constantly resurface in popular culture. This area represents a much needed focus for research.

Death as Final Abandonment

An integral part of the psychological response to death is based on the belief that the after-death experience represents the ultimate form of dissolution when the body is decomposing and social connectedness has also dissolved. However, death opens up the question of whether there is any form of transformation after life. Linked to concepts such as the soul, the supernatural, and the afterlife, fear of death has been explained in many ways across all visual genres. The possibility that this fear could be the ultimate form of freedom, albeit unknown and indescribable, has also been explored. Science fiction horror films, war documentaries, and movies linked to popular culture envision myriad postdeath realms, as well as the possibility that death is total oblivion.

The elements of death and dying represent a fear that death is the absolute end of physical and social existence, the fear that death is nothing but a void without end, representing the notion of total abjection and the absolute fear that the death process leads to total meaninglessness or absolute nothingness. Death of the individual is represented as a marginal phenomenon or a process of reaching toward and beyond the natural limits of the life cycle.

While in many recent movies death is linked to the notions of futility, ultimate finality, and cosmic abandonment, several recent television series portray death in a different perspective. *Crossing*

Over, Medium, and *John From Cincinnati* depict death as a point of transition and transcendence. Also, these screen depictions associate death with moral values, ethical considerations, and principled lives. This difference in focus is emblematic of the ongoing tension and ambivalence that death constantly brings to the human condition.

If death is the central tenet of narrative, then perhaps our infatuation with television and the movies is based on the notion that they provide a sanctuary of viewing an unfolding of what has been called the "little deaths" of others, so that when the larger imminent reality or certainty appears, we are more prepared and accepting of the inevitability.

Deviance, Dying as

The word *deviance* is derived from the Latin verb *deviare,* meaning "to deviate." To deviate is to extend outside the parameters of normative expectation. Dying as deviance, then, is a death that occurs in other than an expected condition, manner, or situation. This entry explores this unique concept within the context of death and the human experience. Thus an analysis of deviance addresses several issues relating to who deviates; from what these individuals deviate; what death-related actions constitute deviation; and how society reacts to death perceived as a deviant act.

Because deviance is understood to be outside the realm of the expected, the concept of deviance is a distinctly human affair. Predicated on the expectation that certain behaviors and attitudes are to be followed, behavior that is contrary to expectation elicits a negative response. It is important to note, however, that what constitutes deviant behavior for some is not necessarily deviance for all. As the postmodernist world becomes more tolerant of diverse perspectives, the interpretation of the seriousness and importance of deviance may become more difficult and differentiation between difference and deviance more problematic. On the other hand, the impact of national strategies to address perceived terrorist threats may influence behaviors and attitudes in a direction of national solidarity and, consequently, toward a more universally standardized expectation of behavior. Not all deviance is considered to be serious, though some deviant acts are viewed as both deviant and wrong because they violate social norms agreed upon and upheld by virtually all societal members. Other deviant acts may be interpreted as wrong by some and not by others.

Deviant death presupposes a culturally specific set of beliefs, values, and norms that are, in some way, violated through the experience of death. Such experience includes those who die as well as individuals who, while in close proximity, may be a participant in lifesaving or death-inducing acts or be among those who observe the death.

Explanations of Dying as Deviance

A variety of sociopsychological explanations are useful for understanding and interpreting dying as deviance. Statistical deviance means that the form of deviance occurs infrequently. This could include desirable spontaneous remission from a terminal or chronic disease or an undesirable diagnosis of a particularly rare disease. This framework is without a moral sense of deviance and simply serves as a measure of occurrence.

An absolutist concept of deviance presupposes that certain behaviors and/or attitudes are simply

inherently and intrinsically wrong. This perspective assumes full societal agreement on what is, and is not, deviant. Laws are viewed by some as a codified response to certain kinds of serious deviance. Others argue that such laws are developed to protect the interests of the privileged and powerful.

The symbolic interactionist perspective holds that deviance is so defined through interpretation; that is, the *act* is perceived by others to be deviant. When an act has *meaning*, that meaning is socially constructed through different or conflicting interpretations of the same behavior. For the symbolic interactionist, the social world is filled with symbols that are meaningful, but these symbols are, to an extent, fluid in their use/application. For example, death of enemy targets caused by military personnel during active warfare is defined and interpreted as desirable, whereas death caused by military personnel during a barroom brawl is defined in a significantly different way. Thus dying is likely to be interpreted differently depending on the context in which dying occurs.

Death as Unnatural

The notion of dying as deviance does not stem from the event of death itself, as all living creatures naturally die. Dying as deviance could result from the perception that the death occurs at an unusual or unexpected time during the life course, either too early or too late. A good death implies a death after a long and fruitful life, wherein the deceased had contributed to the community, as well as having experienced life course events that embellished his or her personal sense of individuation. Death that violates the usual ordering of death—for example, a child's death preceding the parent's death—also can be viewed as deviant. And death by homicide may be a way for humans to address the incomprehensibility of death and enact qualities of the divine since life and death are understood as originating from, and provided through, the divine deity.

Biological Death

Biological death, as the cessation of body organ function, may be framed as deviant if the person pronounced dead unexpectedly and inexplicably regains organ function. In rare cases individuals who have been pronounced biologically dead have spontaneously revived after periods exceeding 12 hours. Dying as deviance may be applied to those who are revived after clinical death has been pronounced. Many individuals who have regained biological functioning after having been pronounced clinically dead provide accounts with strikingly similar qualities. Some adherents of spiritualism and occultism present such accounts as supportive evidence of the certainty of an afterlife, whereas supporters of the scientific perspective dismiss such accounts through arguments that drugs, oxygen deprivation, limbic lobe syndrome, endorphins, and/or sensory deprivation may be physiological conditions influencing perception at death. The address of death in connection with the realm of the occult or supernatural may position the experience or idea of death as deviant, particularly in cultures operating under the paradigm of science.

As the living human being has a significant tendency to identify with the body, death as the demise of the corporal may be viewed as deviant, a departure from the normative realm of the living, physical body. This attitude is contrasted with the notion of the condition after death as the realm of the spiritual. So, too, death as a condition for entry into the "underworld" may be regarded as deviant, a rupture from the normative world of life.

Forms of Dying as Deviance

The form of death—for example, death through crime, death as sexually related, or death as self-deliverance or suicide—may be understood as deviant, as contrasted to natural death caused by old age. In fact, there exist a number of ways dying may be viewed as deviant.

Suicide

Émile Durkheim explained suicide through the analysis of social structure rather than as an exclusively personal act. He proposed four different types of suicide based on the degree of, and combination of, social regulation and social integration. Durkheim found that people who experienced extremely high or low levels of either social regulation or social integration, had a greater tendency to commit suicide. Altruistic suicide often involves

highly integrated individuals whose lifestyle includes rigid proscriptions and restrictions, such as those expected of military personnel, for example, Japanese kamikaze pilots during World War II.

Japanese culture has long recognized an act of completed suicide as vindication from shame, disgrace, and dishonor. However, many other cultures regard suicide as *anti*social. To complete suicide is to reject participation in the social world. Such a rejection is a movement away from the world of sociability and therefore is viewed as deviant. Thus, suicide comes under the scrutiny of the law.

Many organized religions address the issue of suicide. Suicide may be understood as violating expectations of religious mores. The act of suicide always violates the expectations of religious-minded people. To override the will of a god, through willful acts of inducing one's own death, is seen as an offense. Some contemporary religions have guided congregations to engage in ideologies resulting in death. Marshall Applewhite, leader of Heaven's Gate religious cult group, encouraged more than 30 group members to complete suicide within the context of the group's religious ideology. Virtually all religions are concerned with transitions from life to death. The usual pairing of death and religion is not generally perceived as deviant. The encouragement of Heaven's Gate to self-deliverance is unusual within the context of religious direction in the contemporary West.

Finally, clinical psychology views self-harm as a pathological behavior through the assumption that the mentally healthy person does not engage in self-harm. It is the mental illness of the suicidal person that influences their actions.

Autoerotic Fatalities

Autoerotic fatalities are not categorized as suicide because criteria for suicide include the intention of death. Because autoerotic fatalities are sexualized activities wherein a potentially dangerous agent is used for heightening sexual arousal, accidentally killing the victim, the intentionality of death, as in suicide, is absent. Autoerotic asphyxia is a typical cause of death in the majority of autoerotic fatalities. Accounts of autoerotic fatalities evidence ritualistic qualities that often mirror address of the taboo within organized ritual. Many preliterate collectives demonstrate attitudes and responses to taboos through formal rituals. Rituals in such cultures, and even in Western culture, tend to be enacted at life continuum points representing significant changes or transitions from one social status to another.

Atypical autoerotic fatalities include causal factors such as aspiration of vomitus, electrocution, exposure, and Freon or nitrate inhalation. Autoerotic fatalities may be viewed as one of a variety of risk-taking behaviors. Whether or not risk taking is interpreted as deviant has to do with cultural attitudes toward particular behaviors that may be categorized as risk-taking behaviors.

Devil

The devil by definition is a powerful force of evil, either a real spiritual personality or a metaphor for human evil. As such, the concept of the devil exists only in monotheist religions including Judaism, Christianity, Zoroastrianism, and Islam. Other religions (including Greco-Roman, Egyptian, Mesopotamian, and Canaanite beliefs), traditional

Eastern religions such as Hinduism and Buddhism, and animist religions all have spirits who are malevolent or else combine malign with benign qualities, but all lack a single power of evil. In monotheist religions there are demons (minor evil spirits), but they are subservient (as are evil humans) to the great and single devil, who is known by many names, including Satan, Lucifer, Mephistopheles, Azazel, and the Prince of Darkness.

Religious Traditions

Israelite Religion

The figure of the devil is extremely vague in the Tanakh (the Hebrew Bible or Old Testament), where the word *satan* basically means a stumbling block or an opponent of any kind, though a personal Satan appears in a few passages such as in the book of Job. The devil first attained real prominence in the period from 200 B.C.E. to 100 C.E. in Hebrew and Jewish pseudepigrapha (anonymous writings ascribed to ancient figures such as Enoch and Baruch) and in 1st-century C.E. Christian writings, specifically the New Testament. From 100 C.E., rabbinic and Talmudic views prevailed in Judaism and have generally given the devil very little importance.

Early Christianity

In the New Testament gospels, Christ is tempted near the beginning of his ministry by the devil in the wilderness; there the devil claims the power to hand over all earthly riches and powers to Christ, a claim and an offer that Christ refuses. Christ frequently rebukes the devil and casts out (exorcizes) demons from the victims that they "possess." In the writings of Paul and John, diabology (theology about the devil) was developed: He was an angel created good by God, but through his own free will he chose to serve his own ego rather than to love God. As a result, he and the other angels who chose to follow him were cast out of heaven; these fallen angels are the demons who now act under Satan's leadership to block God's plan for the cosmos by corrupting God's creatures. It is the devil who tempts Adam and Eve (representing all humanity) to sin and continues to attack humans by possessing them (taking control of their bodies), obsessing them (launching physical and mental attacks on them), and tempting them. The devil has great power over humanity, though he can never compel anyone to sin, and the central purpose of Christ's mission is to free us from the dominance of sin. By dying for us on the cross Christ breaks Satan's power; still, we retain our free will to sin until the last day, the Last Judgment, at which point Christ returns to cast Satan and his demons into hell forever. Hell, a Christian development of the Jewish Gehenna, is a place of torment for sinners; it is usually located under the earth's surface or in some undefined outer darkness. Its chief characteristic is the absence of God, light, and love.

Christian Tradition

Throughout its history Christianity confirmed these views, developing further details. The early church established hell as the devil's dwelling place from the moment of his fall from heaven yet asserted that he can issue out and roam the world, seeking the ruin and destruction of humanity. The devil and the demons have a dual role in hell: On the one hand they are imprisoned there themselves, and on the other they are the jailers of sinful humans there. Most of the baptismal formulas of the early church included a formal renunciation of Satan, a ritual widely preserved to the present day. The church followed the example of Christ and his disciples by exorcizing demons from the possessed, a procedure still practiced in some denominations. The presence of demons was intensely and widely felt in the first few centuries of the church, particularly in monastic communities, who often felt that their prime purpose was to wage war against Satan. The devil is an angel, an asexual being, but he can assume the form of either sex for the purpose of temptation. In serious writing, the devil is seldom imagined to be female.

Sin, Death, and Hell

The devil was tied to death; it was because humanity (in Adam and Eve) yielded to Satan that humans lost their immortality. Since then, humans are mortal until Christ restores their immortality. The central purpose of Christ's Passion is to free humans from the tyranny of sin and death. By the 3rd century C.E. it was established theology that between his death and resurrection, Christ had

descended into hell to liberate the just who had been consigned to it before his incarnation. At the same time it was becoming common for Death to be personified along with the devil and hell as one of the three great enemies of humankind. From the 4th century a growing body of liturgy, literature, and legend portrayed the dramatic moment when Christ appears at the gates of hell and vanquishes Death, hell, Satan's demons, and Satan himself. Legend and art also established that at personal death, the devil or a demon appears at the judgment of the dying person. When a person dies, the devil accuses him or her and struggles (vainly) against a benign angel to tilt the scale of justice against the dead. Then, if the person is justly condemned, the demons bear off the person's spirit to hell. In no way, however, can the devil carry off anyone whose character is turned away from selfishness and toward love of God.

Opposites: Dualists and Muslims

Certain heretical groups, mainly gnostics, exaggerated the role of the devil to extremes, sometimes asserting that he and Christ were locked in almost an equal struggle to control human society and the whole cosmos. Such ideas were linked to the Zoroastrian idea of a nearly equally balanced cosmic war between the god of light and the god of darkness. By the 7th century C.E., when Muhammad received the Qur'an, the devil was much on the mind of both Christians and Zoroastrians, and in the Qur'an he appears with the name of Iblis or Shaytan. Muslims have always feared and despised him—pilgrims to Mecca continue to stone the pillar representing his power. Though strictly Allah is all-knowing and all-powerful and is threatened or limited by no opposing power whatsoever, it is his will to allow the devil to tempt and persecute humans, whose only hope is *islam* (submission) to Allah. In Islam the conviction that the Qur'an is the literal word of God continues to discourage any deconstruction of any of its passages, including those about Shaytan or Iblis.

Later European Developments

Both Christian (Orthodox, Catholic, and Protestant) and Muslim theologians continued to develop the idea of Satan right into the modern era without changing the basic concept. The Protestant Reformation in 16th-century Europe did virtually nothing to change the theology of the devil, although the struggles between varieties of Christianity in that and the following century caused an increased belief in the presence of Satan and in the reality of witchcraft. However, beginning in the 18th century, Christian Europe developed increasing skepticism about religious authority, tradition, and the Bible. That had two huge effects on the concept: the development of a "liberal Christianity" that had little room for the devil, and the development of agnosticism and atheism that rejected Christianity and religion as a whole.

Those two effects are felt mostly in Europe and, to some extent, in the United States, but in countries where Christianity is on the rise—Africa, Latin America, and China, for example—biblical and traditional views continue to prevail. In Western countries the decay of belief in the existence of Satan can be observed in four different attitudes. Among the dominant intellectual elite, the devil is a silly and superstitious idea that has been proven wrong both by philosophical materialism and by literary deconstruction. For this elite, belief in the devil is one of a number of preposterous ideas that make Christianity meaningless. Among the minority of the elite who are Christian, the assumption is that the devil may be said to exist, but only as a metaphor for human evil. Among the clergy, most Catholic and "mainline" Protestants strenuously try to avoid mentioning the devil or hell, partly because they feel that such beliefs make Christianity less plausible and partly because they fear losing their congregations by making them feel uncomfortable. Some clergy, however, especially Evangelicals, teach that the existence of Satan cannot be questioned in the light of clear biblical teaching. In popular culture, hedonistic materialism and feel-good self-esteem discourage thinking about the devil, sin, and death.

Contemporary Satanism

Since the 1960s there has been a strange set of countercurrents in the West, especially in the United States. Renewed belief in the powers of Satan led to an increase in exorcisms. Fear of Satanism became a mini-craze in the 1970s and 1980s, when a number of people lost their jobs

and even their liberty because of lurid, false accusations, and a few people declared themselves to actually be Satanists. Of these last, most are simply poseurs, but a few actually believe that Satan is the good spirit and God the evil one. Such a belief springs from the Romantic movement of the 19th century, when political and cultural revolutionaries glorified rebellion and regarded God (along with church and state) as a tyranny to be overthrown. Among most people today who believe in the existence of the devil, however, the emphasis is much less on the negativity he represents than on the positive hope for harmony with God. In all monotheist religions, the devil has power only to tempt and not to control; therefore a person who has led a life of love and obedience need have no fear of the devil at the moment of death or in an afterlife.

Disasters, Man-Made

Disasters are significant disruptions of a social system that compromise that system's ability to respond to the disruption on its own. Disasters can vary widely in their geographic scope and impact. For example, a disaster might impact a small municipality of less than 1,000 people or impact hundreds of thousands of inhabitants of a major metropolitan area. Man-made disasters are those disruptions that originate from the intentional or accidental actions of humans. The sarin gas attack of March 20, 1995, in the Tokyo subway and the massive terrorist attack on September 11, 2001, are examples of the former, whereas the radioactive steam emission from the Three Mile Island Nuclear Generating Station on March 28, 1979, and the Exxon *Valdez* oil spill of March 24, 1989, exemplify the latter.

Disaster Types

There are many types of man-made disasters. They include the disruptions that result from breakdowns in the technology that humans have created. Examples could include dam failures, radiation breeches, chemical spills, and other far-reaching technological failures. Other man-made disasters include intentional acts, such as technological sabotage and bioterrorism, as well as other

terroristic acts that create a significant disruption in a social system.

A disaster is more than an emergency. It is an event of such magnitude that local first responders and emergency managers are overwhelmed and unable to cope, on their own, with the scope of the event. In addition, disaster events that are triggered by illegal actions create an additional overlay on the response to the event. Local, state, and federal law enforcement officers may have jurisdiction, which can complicate the initial and continuing response to the situation. The organized efforts to respond to, as well as prevent, mitigate, and recover from disasters that are precipitated by terrorist actions are termed *homeland security*.

The Sarin Attack

The sarin gas attack involved the release of packets of the chemical during morning rush hour on the Toyko commuter transport system. One drop of this chemical agent is sufficient to kill an adult. In total, there were five separate releases of the chemical on different trains by a team of attackers that resulted in 12 deaths and over 1,000 injuries. The event has been described as domestic terrorism, although some researchers are now viewing it from the perspective of a toxic disaster. A toxic disaster has some unique features, which include the "invisible" nature of the attack. Specifically, radiation, germs, and chemicals are invisible to the human eye and thus create special stresses. The stresses flow from the lack of awareness of how the toxin will impact victims over the long term. In particular, there may be no specific end point for the impact of the toxin as it may have increasing and unknown negative health impacts over time. As such, there can be a variety of mental health consequences concomitant to the exposure. These may include depression, anxiety, somatization, post-traumatic stress disorder, and other negative outcomes.

Three Mile Island

The Three Mile Island event involved the escape of radioactive steam due to equipment failures and human errors. The governor issued an announcement that those 3,500 individuals in the immediate area should evacuate. Surprisingly, reports indicate that a total of 150,000 to 200,000 people left the area, some for several weeks. The event caused no immediate deaths, and a variety of epidemiological studies have focused on the longer-term health consequences to residents. This type of "accident" has led commentators such as Kai Erikson to describe Three Mile Island as falling into a "new species of trouble" in the form of technological disasters. Included in this grouping are events such as Chernobyl, Bhopal, and the Buffalo Creek flood disaster. As is the case with the sarin gas example, these technological disasters involved toxins that elicit a special type of fear as well as a variety of psychological symptoms. This is because toxin-based disasters may leave a residue and create a contamination effect rather than a time-limited damage trajectory as in the case of such natural disasters as tornadoes. Some toxin-based technological disasters can invisibly wreak havoc on the human body, and so victims can carry the impact of the disaster with them continually for the remainder of their lives.

Man-made disasters have increased in frequency and their incidence has resulted in significant human mortality and associated experiences of grief, bereavement, and mourning among survivors. It is important to recognize that loss in disasters includes personal and public dwellings, environmental resources, memorabilia, and other possessions, as well as the loss of human life. This entry presents issues related to human mortality and loss from the perspective of the disaster phase model. The disaster phase model is a conceptual framework employed in the field of emergency/disaster management that provides a general orientation to the sequence of disaster events.

Disaster Phases

Disasters, both natural and man-made, are in the purview of the developing discipline variously called emergency management or disaster management. The term *emergency management* is used in this entry as it has become the traditional label for the network of managers, planners, and others who form the developing profession whose work involves the identification and management of risk.

A frequently used resource for examining activities related to disasters is the disaster phase model. This model conceptualizes disasters as a cycle

involving preparedness, response, recovery, and mitigation. Preparedness refers to those activities prior to a disaster that involve planning, training, or notification and warning systems. Response constitutes those activities during a disaster that are directed to immediate emergency assistance such as medical care, security, evacuation, search and rescue, and related activities. Recovery is a process that is thought of in short-term and long-term dimensions. Short-term recovery typically refers to weeks or months while long-term recovery spans years and, in some cases, decades. Mitigation activities focus on eliminating or reducing a risk. These activities can be structural, such as using of building codes or levees, or nonstructural, such as developing education or insurance programs. These phases can overlap as the activities of one phase can spill over or be embedded in the other.

This disaster phase model will be used to review death and dying issues as they relate to man-made disasters. Under each category of the disaster phases there is a detailing of what Robert Kastenbaum has described as the death system. The death system is the matrix of people, places, times, objects, and symbols that constitute the social response to death.

Preparedness Phase

From the death systems approach, preparedness would include those predisaster activities that have the objective of saving human life and reducing human suffering. This includes all first responder systems. Given the possibility of death in many man-made disasters, preparedness would also include the organization of specialized counselors with skills to work with survivors of the disaster as well as those who have lost family or friends in the disaster.

Preparedness activities also include the development of Disaster Mortuary Operational Response Teams (DMORTs). DMORTs began in the 1990s and now include over 1,200 volunteers who are grouped into 10 regional teams. These teams have the following responsibilities: temporary morgue facilities, victim identification, forensic dental pathology, forensic anthropology methods, and the processing, preparation, and disposition of remains. The DMORT program is supported by two disaster portable morgue units, one located in Rockville, Maryland, and the other in San Jose, California.

In a more general sense, the growth of death education at all levels is a form of preparedness, as knowledge of grief, bereavement, and mourning processes enhances the understanding of a wide range of individuals, and this can provide an additional preparedness resource. In particular, the growth of death and dying courses on higher education campuses is particularly beneficial. Many universities with emergency management programs may have courses in death and dying that can provide critical background knowledge for those who deal with mass fatalities and the needs of those who have lost significant others in a man-made disaster.

Response Phase

The activities of preparedness merge into the response phase. DMORT is a response-oriented program and is requested only when more deaths occur than the local responders can manage. The response phase in disasters is dominated by first responders, such as firefighters, HAZMAT teams, law enforcement, and related professionals. Specially trained counselors are also an important part of the response phase when deaths or other traumatic events have occurred.

The increase in mass casuality events has led to a proliferation of books and operational texts that provide guidance for managing these types of situations. Memorialization can also become a focal process in the response phase of a disaster. Sylvia Grider refers to these informal cultural responses as "spontaneous shrines." This form of informal memorialization response was evident after the Oklahoma City Murrah Building bombing in 1995 as well as at the sites of the 2001 terrorist attacks.

Recovery Phase

Recovery work in the area of death and dying focuses primarily on the counseling dimensions and less on structural activities. Counseling activities can be directed to a wide range of individuals who may need special support. These include families, friends, and coworkers of the deceased, as well as those who assist in fatality management, body recovery, and body identification.

Recently, special attention has been directed to the needs of children bereaved after the September 11, 2001, terrorist attacks.

Memorialization activities are also an important part of the social psychological process of recovery. Terrorist-triggered disaster events that result not only in multiple deaths but also in extensive infrastructure damage are often followed by the construction of memorials to commemorate the lives that have been lost. Commemorative efforts after the destruction of the World Trade Center towers are perhaps the most visible example of efforts to symbolize the loss of life, as well as other losses, experienced from the attack. The Pentagon Memorial is another example of these efforts. A variety of other vehicles such as websites, t-shirts, posters, and other creations have become tangible expressions of loss as well.

Another important recovery activity that relates to the death system includes economic recovery. One traditional element in economic recovery from the loss of an individual life includes resources such as life insurance. This is also a part of individual preparedness as families and households need to determine their level of financial risk if an income-earning member of the group dies and is no longer able to provide for the financial needs of dependents.

After some man-made disaster events, an attempt will be made to determine liability for the event. If negligence is determined, then survivors may be entitled to a significant financial settlement.

Mitigation Phase

The fourth phase of the disaster cycle is mitigation. Mitigation and preparedness are interlinked phases. Structural activities, such as levee construction or building codes, frequently come to mind when discussing mitigation. In the realm of death and dying, nonstructural mitigation such as education would be particularly relevant. Educational activities, for example, can be helpful in mitigating the impact of death by sensitizing individuals to the variability of grief and the typical range of responses to loss. An understanding of the range of responses can help individuals to normalize their experience or to seek assistance if the mourning process does not lead to resolution.

Memorialization relates to mitigation in that formal memoralization helps socially define and institutionalize the event. Formal memorial sites serve an educational function with the educational goal of maintaining the history of the event and its impact, thus establishing a tangible symbol of what should be avoided in the future.

Disasters, Natural

Throughout history human beings have been confronted by the forces of nature. Natural disasters serve as vivid reminders of just how powerful those forces can be and how vulnerable societies are to them. Volcanic eruptions have buried ancient cities, droughts have devastated entire regions, and tidal waves have inundated small fishing villages and major tourist destinations alike. The tragic and lasting effects of these kinds of events are reflected in folklore, literature, and film and passed on from one generation to the next. In addition to their potential for widespread physical destruction, natural disasters disrupt

society's normal functioning, stretch community resources beyond their limits, and often leave sizable death tolls in their wake. Yet, human societies are surprisingly resilient in the face of catastrophe. Survivors find ways to effectively cope with their losses, most communities manage to rebound, and social life continues. Large-scale disasters do, however, pose some major challenges. Social inequality, for example, plays a vital role in shaping people's vulnerability to disasters—that is, some social groups are more likely than others to be negatively impacted by them. Additionally, because they result in mass fatalities, natural disasters have important implications for the systems that exist in every society to handle and process the dead, sometimes leading to temporary changes that violate established cultural practices and exacerbate the suffering of survivors.

Types of Natural Disasters and the Deaths They Cause

The UN International Strategy for Disaster Reduction estimates that from 1991 to 2005, nearly 1 million people worldwide died as a result of natural disasters. Based on that estimate, approximately 65,000 lives are lost each year, a number that is certainly not trivial but much lower than other risks present in modern society. In the United States alone, for example, the National Highway Traffic Safety Administration reports that approximately 45,000 motorists die each year in automobile crashes, and according to the American Cancer Society, more than 500,000 people die each year from cancer. It can be concluded, therefore, that a person's risk of dying in a natural disaster is relatively low compared to other, more common causes of death. However, it should be noted that this risk goes up or down depending on where a person lives in the world and his or her demographic characteristics, including race, social class, gender, and age.

In estimating the fatal impacts of natural disasters, it is common to distinguish between three major categories of events: weather-related phenomena, geological processes, and biological episodes. Weather-related disasters include hurricanes, tornadoes, droughts, heat waves, wildfires, and floods. Geological events include volcanic eruptions, earthquakes, and tsunamis, which are massive waves triggered by seismic activity. Biological disasters include epidemics of rapidly spreading contagious diseases and serious cases of insect infestation. Over the past decade and a half the most commonly occurring disasters have been floods, hurricanes, tornadoes, epidemics, and earthquakes. The most deadly events have been earthquakes and tsunamis, causing almost half of all disaster-related deaths during that time period. This fact is not surprising given that the 2004 Indian Ocean tsunami, which caused approximately 250,000 deaths, occurred during this time frame, as did major devastating earthquakes in Japan, Turkey, Iran, and Pakistan. Hurricanes, tornadoes, and other windstorms have caused approximately 25% of disaster-related deaths in the past 15 years, and the remaining deaths are distributed across the other disaster types.

Beyond the obvious differences in their physical properties, disasters also vary along other important dimensions, all of which have consequences for the ways in which people experience them. For example, some disasters, such as earthquakes and tornadoes, strike very quickly, whereas others, such as droughts and hurricanes, have a much slower speed of onset. As a result, the latter events allow for a considerable period of forewarning, during which time people can take protective measures and get themselves out of harm's way. Conversely, rapid-onset events offer little or no advanced warning, thereby increasing people's risk of injury or death. Disasters also vary in terms of the magnitude, scope, and duration of their impacts. At one extreme, tornadoes tend to last only for a short period of time and produce damage that, while substantial, is limited to a relatively small geographical area. Droughts and epidemics, on the other hand, can last for days, weeks, or even months and cause widespread damage across an entire region.

While there are basic differences between various types of natural disasters, it is important to note that there are also significant and meaningful similarities between them. For example, all disasters share in common the fact that their effects are felt by groups, not just individuals. Certainly, experiencing a traumatic event can have profound consequences for an individual, but that event is only considered a disaster if it affects multiple individuals at once. In other words, disasters, regardless

of their physical properties, are collective events, not personal traumas; this is an important distinction that has consequences for how people experience and cope with them. Another common feature shared by all disasters is that they place extraordinary demands on local communities, requiring them to rely on the assistance of outside agencies and volunteers in order to effectively respond. Despite the traumatic and extraordinary nature of disasters, communities confronted by them tend to respond in a predictable and surprisingly prosocial, resilient manner.

Community Impacts of Natural Disasters

A common misconception about natural disasters is that they produce overwhelmingly negative effects. It is commonly believed, for example, that in the wake of a major disaster there will be widespread panic, looting, and other antisocial behavior. It is also often assumed that individual victims will experience acute post-traumatic stress disorder and other psychological problems, immobilizing them in a state of severe shock and preventing them from being able to take care of themselves and their families. Professional emergency responders, it is feared, will abandon their jobs in order to tend to personal matters, leaving the community in a state of chaos and anarchy. The mass media, of course, plays a crucial role in the perpetuation of these and other disaster myths, using distorted images and sensationalized accounts of human suffering to appeal to viewers, readers, and listeners. In the aftermath of Hurricane Katrina in 2005, for example, the media portrayed New Orleans as a city in shambles in which civil society and the rule of law had collapsed.

The reality of community response to disaster is quite different from the negative view purported by the media. Even in the midst of extreme physical damage and widespread death and injury, people exhibit remarkable strength, resilience, and altruism in response to major natural disasters. During the emergency response period, crime rates typically go down and helping behavior increases dramatically, as individuals and organizations work together in novel and innovative ways to meet heightened demands brought on by disasters. Informal volunteer groups form to carry out search and rescue activities, and donations begin to pour in from neighboring communities, as people immediately begin putting their lives back together. In stark contrast to the negative view portrayed by some media, most responses to natural disasters exhibit high degrees of social order, organization, and creativity.

Social scientists have found this pattern of prosocial behavior to be consistently present over the past several decades, leading them to conclude that natural disasters are capable of producing a therapeutic effect on the communities that experience them. Having gone through such a stressful experience together, community members develop a stronger sense of collective identity, efficacy, responsibility for each other, and shared purpose. It is important to note, however, that these positive outcomes can be short-lived, quickly giving way to feelings of unfairness and exclusion as decisions about relief and recovery expenditures are made. Furthermore, there is a significant amount of research suggesting that this argument does not apply to technological disasters, including nuclear power plant incidents, toxic chemical releases, explosions, and other human-induced crises.

While natural disasters are capable of producing some positive effects, they also pose significant challenges for human societies. For example, although they are widely perceived to be random and unexpected, natural disasters actually discriminate, subjecting some groups to their harmful effects more than others. Additionally, when they result in a large number of deaths, natural disasters sometimes force communities to alter the ways in which dead bodies are handled, causing added stress for survivors and complicating the recovery process.

Social Inequality and Natural Disasters

Social inequality is present in all societies—that is, things that are socially desirable and undesirable are distributed in an unequal fashion. Social desirables include such things as money, power, and education, whereas undesirables include poverty, environmental pollution, criminal victimization, and other social problems. The bases of social inequality vary from one society to the next, but the most common determining factors include race, social class, gender, age, and region. In many countries social movements have formed to actively promote

and protect the rights of women, minorities, and the poor, but problems of inequality persist.

The consequences of social inequality are plainly revealed in the context of natural disasters. In the past 15 years, approximately 90% of the deaths caused by natural disasters worldwide have occurred in developing countries, such as India, Pakistan, Bangladesh, Indonesia, Turkey, Iran, El Salvador, Mexico, and Guatemala. Conversely, the developed countries of western Europe, the United States, and Canada have experienced far fewer disaster-induced deaths. Thus, for the developing world, disasters exact staggering financial and human costs, while in the developed world their impacts tend to be primarily, though not exclusively, financial.

These numbers clearly demonstrate that social inequality operates on a global scale between societies, but it is also important to recognize that similar effects can be observed within a single society. Research in the United States, for example, suggests that racial minorities, the poor, and the elderly are more susceptible to injury and death in natural disasters than are others. Among survivors, these same groups have a more difficult time recovering from disasters.

The heightened vulnerability to natural disasters of some countries and groups relative to others is the result of many factors. At the country level, for example, the higher death tolls in some disasters can be attributed to a combination of population density, dangerous construction practices, and lax enforcement of building standards. In other cases, mass fatalities result in large part because of the lack of adequate early warning systems that would allow people to take necessary protective actions. Fatalistic attitudes that exist among some cultures can create a climate of apathy in which people accept high death tolls because they perceive disasters as acts of divine intervention.

At the local level, developers sometimes pressure planning commissions and city councils to allow them to build in high-risk areas such as floodplains in order to provide affordable housing to low-income, minority, or elderly residents. In other cases, affordable housing comes in the form of mobile homes, which lack the structural integrity to withstand a tornado or hurricane. For the elderly, social isolation can be a major factor that contributes to their increased risk of being injured or killed in a natural disaster, and for the poor it can be as simple as not having a car or enough money to leave when an evacuation order is issued.

Handling the Dead in Natural Disasters

In addition to the problem of social inequality, natural disasters also create logistical problems in terms of handling the large number of dead bodies. Every society has established procedures, structures, and cultural practices in place for dealing with the deceased. Of course, there is tremendous cultural variation in terms of how death is processed, but there are several core concerns that cut across cultural lines. Social norms, and in some cases written laws, spell out the proper way in which a body should be handled, prepared, and presented; imbue certain actors with the authority and legitimacy to handle dead bodies and certify death; and prescribe culturally acceptable methods for grieving and coping with the loss of human life. These practices, which have been passed down from one generation to the next, work well under normal conditions, but natural disasters are extraordinary events in which death occurs on a massive scale. As a result, these practices are sometimes modified in the aftermath of major disasters, which can have both functional and dysfunctional results.

There are times when death practices have to be modified simply because of the sheer number of fatalities involved. For example, under normal conditions it is possible for a few trained death professionals to recover bodies as they surface one at a time, but during a disaster it is sometimes necessary to recover tens, hundreds, or even thousands of dead bodies. Out of necessity, then, death specialists have to rely on the assistance of volunteers, many of whom have no professional training in dealing with emergencies. The involvement of these volunteers poses a significant dilemma: On the one hand, they are exposed to potential psychological trauma resulting from their encounters with death; on the other hand, the death establishment is not equipped to handle the situation on its own. Another alteration to death practices that is sometimes necessitated by natural disasters is the creation of temporary morgues, which can include gymnasiums, parking structures, and ice rinks.

Under normal conditions a fairly small morgue is adequate for storing bodies until they can be identified by family members, but in a major disaster a larger space is required for the identification process. Once it has been identified, the body can then be transported to a mortician for preparation and included in traditional funeral rites.

Whereas some modifications to death practices are necessary and functional in light of the circumstances brought on by natural disasters, some changes can have dysfunctional results for survivors. In particular, mass burials or cremations can cause extreme anxiety for survivors, undermine the grieving process, and impede their ability to effectively cope with, and recover from, the tragedy. When bodies are disposed of in this fashion, it is often because community leaders fear that the presence of decomposing corpses will expose survivors to adverse health consequences and potentially cause an epidemic. Epidemiologists and public health researchers, however, have found that such concerns are unfounded and have actively discouraged the practice of mass burials. Sociologist Émile Durkheim offered insights that also suggest that mass burials can have dysfunctional effects for survivors. In his classic study of religious rituals, Durkheim argued that funeral rites in particular serve important functions in society. Most notably, for survivors they provide an outlet for the expression of grief, reaffirm the strength of the community, and remind individuals that despite their losses social life continues. When people are deprived of these socially meaningful rituals, it is more difficult for them to achieve emotional closure and lead a healthy life after a tragedy. Indeed, the social value of these rituals is vividly revealed by the tendency of survivors to commemorate disasters through the creation of informal and formal memorials and recognize anniversaries as time passes.

Coping With Natural Disasters in the Future

As people throughout the world continue to settle in hazard-prone areas, natural disasters will continue to occur. The financial costs of physical damage caused by these events will likely increase, and more lives will be lost. Although it may not be possible to prevent all disaster-related deaths, there are measures that can be taken to dramatically reduce the death tolls of disasters. For example, early warning systems that alert people of impending hurricanes, tsunamis, and other threats can be improved through additional research and made more widely available, including in the poorest countries of the world. Public officials responsible for communicating risk information and charged with emergency management responsibilities can make special efforts to reach out to the most vulnerable segments of the population, including the poor, the elderly, and minorities. Finally, national and local governments can do more to educate themselves about natural hazards and make better policy and land-use decisions that balance the need for short-term economic development and the longer-term safety and sustainability of their communities.

Discretionary Death

As a result of advances in medical technology and antibiotic therapy, the average life span in Western societies has increased significantly. Most people no longer die from infections or parasitic diseases but from protracted degenerative diseases; for this reason, dying may be a prolonged and painful process. This situation has paved the way for changes in hospital practices concerning death, where limitation of life support and even hastening of death are becoming increasingly commonplace. Consequently, a subtle but major conceptual shift has taken place regarding established notions of natural and unnatural death. Discretionary death thus defines and identifies a class of death situations that has become increasingly common and which entails neither natural death (defined as death without human intervention) nor unnatural death (defined as accident, negligence, or killing).

A New Technical–Medical Context

Modern life support technology in health care is able to uphold life functions in critically ill patients to a considerable extent and for a significant period of time. These forms of technology have been enormously successful in rescuing patients from medical crises, such as heart failure, stroke, hypothermia, traumas, and other acute life-threatening episodes and have made it possible to perform major surgical procedures.

Alongside the major benefits these technologies provide, they also lead to unintended consequences in the form of growing human and financial costs, for instance, the futile prolongation of dying processes in incurable patients. Furthermore, some of the rescued patients suffer from serious neurological deficits and/or poor quality of life. In response to these unintended consequences, the first standard guidelines for limiting life support in cardiopulmonary resuscitation and ventilation were issued in the 1970s in the United States. Later these guidelines were developed into institutionalized practice based on the principles of patient autonomy and informed consent.

Death and End-of-Life Decisions

Death preceded by decisions of limiting life support or forgoing of life-prolonging treatment are increasingly common today. (The limitation of life support is indicated by different designations such as do not resuscitate orders, allow natural death, forgo life-sustaining treatments, advanced directives, or withholding and/or withdrawing life support.) Comparative studies of end-of-life decision making in Europe and the United States indicate that the administration of drugs with the explicit intention of hastening death and decisions to limit life support without the patient's request are commonly practiced. Approximately 70% of all deaths in European intensive care units are preceded by a decision to withhold or withdraw support. Even larger figures are reported for neonates and infants in intensive care units in Europe and the United States. In several European countries one fourth of all hospital deaths are preceded by decisions to limit treatment or hasten it through palliative efforts.

Futility, Quality of Life, and Patient Autonomy

End-of-life decisions are related to several factors, including medical and social factors. The principal medical factors influencing the decision to limit or forgo life support are prognosis, condition of the patient, and assessments of the utility of treatment, that is, determinations of futility. However, considerations of whether the patient might benefit from further life support are not entirely medical as they entail judgments about the expected benefits for the patient as well as the avoidance of inflicting harm. Futility sets an upper limit for intervention, justifying turning over the process to nature, for which human agents are not responsible. In a sense, futility has developed into a pivotal normative concept that guides and supports judgment in the area of discretionary death

A second factor considered in decision making is the quality of life to be saved or prolonged. Linked to characteristics such as the patient's age and the perceived seriousness of the illness, these quality-of-life variables also have medical meaning. But the value judgments about the patient's quality of life (present and future), which are attached to age and the perceived seriousness of the illness, influence quick decisions such as those relating to the intensity and extent of resuscitative efforts in emergency situations.

A third factor is the wishes of the patient and/or the family regarding prolongation of life and under what conditions. This is based on notions of autonomy and the right of the patient to make decisions about his or her own situation. This type of determination can be extended to the next of kin as representatives and witnesses of the wishes of the patient.

Thus, three factors—futility, quality of life, and the autonomy rights of the patient—are key influences in discretionary judgment. These are not simply medical but also relate to social and normative dimensions. The distinction between natural and unnatural death, increasingly ambiguous, relates to a fundamental distinction in social life, namely, the difference between what we define as "natural" and what we define as "social."

Natural and Social Conceptualizations of Death

This distinction is particularly important because it attributes moral responsibility and legitimacy to particular events, resulting in responsibility being assigned to human agents for certain occurrences or freeing them from such responsibility.

The social and the natural are two distinct frameworks or sense-making categories associated with particular and distinctive discourses. The natural framework encompasses natural events or unguided, unintended phenomena that, from beginning to end, are due to natural determinants. The frame excludes human agency and intentionality. Causality is understood as chain of cause and effect without human intervention. Within this framework, standard medical terminology still refers to *natural death*, for example, when referring to unintended death or letting nature take its course, in contrast to intended death such as euthanasia.

The counterpart to the natural is the social framework. This is the conceptual domain of the act and action, which is expected to be normatively regulated. It implies motivation and intentionality of human agents. Occurrences embedded in this framework are interpreted as "guided doings"; that is, they are the result of human agency. Causality refers to purposeful actions of human agents and to intended or unintended effects of human judgment and action. Thus, in the social realm it is more appropriate to talk about deed and intentionality rather than of occurrences or events and their natural causes.

The introduction of notions of human agency in relation to such phenomena opens the way for normative concepts and moral judgments about human discretion and intention. Thus, nonnatural death is placed within a social frame, and social agents are held responsible in that criminal liability is attached to human acts that cause death. Omissions would not necessarily be considered criminal; however, they might be viewed as neglect of professional responsibility.

Understanding Discretionary Death

Discretionary death entails a classification of situations in which human intention and intervention are decisive. Although some uncertainty, confusion, and contentiousness are evident, such death as deed is not arbitrary. The moment of death and the means of death may be negotiated, especially with respect to when and how life support and levels of palliation are determined. Much end-of-life palliation is carried out under the doctrine of the "double effect," in that the immediate cause of death of a patient is not intended even if foreseen. Because this concerns dying patients, the term used is to *hasten* death and not *cause* death.

The increasing recognition of the rights of patients to choose not to be supported by all available technologically means sanctions the transformation of the moment and process of death into a deed, a matter of judgment and technological intervention. Typically, discretionary death situations entail discussions and negotiations involving not only responsible medical personnel but also the patient and/or relatives and friends of the patient.

Death as Negotiable

The emergence of a negotiated death is part and parcel of the discretionary death concept. Many patients and families negotiate, directly with physicians and other involved professionals, the patterns and course of treatment. These negotiations may also involve lawyers and hospital administrations and concern the possible liabilities from halting therapies, alternative and competing options, and issues of how aggressive or passive to be in terms of levels of intervention. As a result, decisions about withdrawing life support for comatose patients are rendered whether or not directives or testaments for their own care and final treatment are already in place. These negotiations may be informal and ad hoc or formal, depending on existing legal and administrative regulations.

Staging Death as Natural

Within the framework of discretionary death, life support technology may be used for staging a natural good death in the hospital in order to realize a special or unique representation of death. The patient's next of kin, for example, may be led to believe that a peaceful natural process is taking place. In this case, technology and intervention become constitutive of, rather than separate from, the natural. The situation is thus staged and negotiated in such a way that human intervention is defined and perceived as minimal, thus satisfying conditions for the natural frame. Another aspect of staging death in the form of a fictionalized natural process of death is the suggestion of replacing the term *DNR* (do not resuscitate) with AND (allow natural death); the euphemism AND is a softer expression concealing in part the discretionary judgments involved.

Once again, situations of discretionary death—because of the deliberations and negotiations as well as conditions of ethical and legal accountability—point out the prominent role of human agency.

Beyond Natural Death and Intended Death

The new technological developments outlined here and within a zone of discretionary death have unsettled the established model of death based on a dichotomy of death with two modes: natural or unnatural, along with the norms and social relationships based on each of these. Thus, given the new technological possibilities, deaths that do not fit this dichotomy and abnormalities, misunderstandings, and controversies are frequently reported in the medical literature as well as in the media.

Norms, laws, and shared understanding, which represented a basis of defining, interpreting, and regulating earlier judgments and action, often fail in the face of the new situations. These situations are noteworthy under the terms of limiting and forgoing life support, terminal sedation, passive or active euthanasia, physician-assisted suicide, and palliative care.

New Notions of Intentionality and Death

Another development is that physicians no longer represent agents engaged in death decision making. The physician-autonomy model is under challenge by the patient-autonomy model. In a world of negotiated pluralistic death, patients have an increasingly important role, as noted in social movements relating to the right to die and to physician-assisted suicide.

In response to the indignities of high-tech death, more flexibility and greater options in forms of dying, supported by themes in the broader culture of self-determination, personal empowerment, and secularized systems of meaning, are sought. In this milieu arguments are directed at reform in the law and in the practice of medicine.

Simultaneously, new norms develop not only within the medical profession but also among physicians and other agents representing the law, the courts, politics, the mass media, and the general public.

Whatever norms are eventually established must transcend particular interests and be shared across social sectors. The challenge is to develop norms and normative principles that are generally understandable and acceptable to a wide spectrum of social agents at the same time they serve to guide and legitimize physicians and other health care personnel who orchestrate the functional aspects of intensive care units and hospices with respect to discretionary death. Thus, the new morality of intervention has to define acceptable and unacceptable applications of these new technologies as well as to establish limits. At this time the application

of new technology results in the prolongation of bodily function that may no longer be considered worthwhile, or at least is questionable.

Disenfranchised Grief

Disenfranchised grief is defined as that emotion which people experience when they incur a personal loss that is not openly acknowledged, socially sanctioned, or publicly mourned. The term has been thoroughly explored in two books by that same title and is a generally accepted concept within the literature on grief.

The concept of disenfranchised grief integrated a sociological perspective into the study of grief and loss. Previous theory emphasized grief as an intrapsychic process. Kenneth Doka's work emphasized that this process is heavily influenced by the degree to which the other individuals and society at large acknowledge and validate that loss. Grief is complicated when others do not acknowledge that the individual has a right to grieve. In such situations, persons are not offered the rights or the grieving role (such as a claim to social sympathy and support) or such compensations as time off from work or diminishment of social responsibilities.

To understand the social aspect of grief, it is important to remember that every society has norms that not only govern behavior but also affect cognition as well. Every society has norms that frame grieving. Thus, when a loss occurs, these grieving rules include not only how one is to behave but also how one is to feel and think. They govern what losses one grieves, how one grieves them, who legitimately can grieve the loss, and how and to whom others respond with sympathy and support. These norms exist not only as folkways, or informally expected behaviors, but also in formal statements such as company policies that extend bereavement leave to certain individuals or regulations and laws that define who has control of the deceased's body or funeral rituals.

In the United States and many other societies, these grieving rules limit grief to the deaths of family members. When a family member dies, one is allowed and expected to grieve, often in a specified way.

Yet human beings exist in intimate networks that include both kin and nonkin. They harbor attachment to fellow humans, animals, and even places and things. Persons experience a wide range of losses—deaths, separations, divorces, and other

changes or transitions. When these attachments are severed, be it by death or any other separation, the individual grieves such loss in characteristic ways. Individuals may experience, express, and adapt to loss in many ways, some outside of the grieving rules. In such situations, the personal experience of grief is discordant with the society's grieving rules. The person experiences a loss, but others do not recognize that grief. That person has no socially accorded right to grieve that loss or to mourn it in that particular way. Some analysts suggest that individuals internalize these grieving rules. Thus, there can be an intrapsychic or self-disenfranchisement of grief where individuals believe that the grief they are experience is inappropriate, repressing the grief or converting it to feelings of guilt or shame.

The Disenfranchisement of Grief

There are a number of reasons that grief can be disenfranchised. First and foremost, in most Western societies, the family is the primary unit of social organization. Hence kin ties have clear acknowledgment in norms and laws. Although most individuals live their lives in "intimate networks," or associations that include both kin and nonkin, only kin have legal standing.

Another principle of Western societies has been rationality—meaning that beyond the family, policies should apply equitably to all. The grieving roles reflect that. Extending grieving roles to nondeath situations or to nonkin would create organizational burdens. Organizations would be forced to define levels of friendship or types of loss. They might be required to broaden the concept of bereavement leave, at considerable cost. Acknowledging the death of kin alone makes organizational sense. It recognizes the grief of kin when a family member dies, at least symbolically. By limiting the acknowledgment of loss to family members, organizations avoid confusion and potential abuse, affirming a single standard. This keeps organizations from having to assess on an individual standpoint, whether this loss or relationship is entitled to recognition. These policies then serve to reflect and project societal recognition and support, again reaffirming and sanctioning familial relationship.

They also point to another significant factor—the relationship of grieving rules to ritual. The funeral becomes the vehicle by which grief is acknowledged and sanctioned, and where support is extended. The primacy of a family at the funeral reaffirms that these survivors have experienced a loss and that their subsequent grief needs sanction, acknowledgment, and support. The rite of the funeral publicly testifies to the right to grieve.

Naturally, in a diverse society, even the losses disenfranchised by society as a whole may be acknowledged within a smaller subculture. For example, the death of a gay lover may not be fully recognized by family or coworkers, but the grieving partner may be recognized and supported within the gay community. According to Frank Eyetsemitan, these grieving rules may change over time. Younger cohorts, for example, may be more supportive of the loss of an unmarried cohabiting couple. Thus subcultures may mitigate the sense of disenfranchisement. Naturally this implies that grieving rules differ among cultures. What is disenfranchised in one culture may be supported in another.

Typologies of Disenfranchised Grief

Losses attributed to disenfranchised grief can be distributed into five broad categories:

The Relationship Is Not Recognized

Grief may be disenfranchised in those situations in which the relationship between the bereaved and deceased is not based on recognizable kin ties. Here the closeness of other nonkin relationships simply may not be understood or appreciated. The roles of lovers, friends, neighbors, foster parents, colleagues, in-laws, stepparents and stepchildren, caregivers, counselors, coworkers, and roommates (e.g., in nursing homes) may be long-lasting and intensely interactive; even though these relationships are recognized, mourners may not have full opportunity to publicly grieve a loss. At most, they might be expected to support and assist family members.

Then there are relationships that may not be publicly recognized or socially sanctioned. For example, nontraditional relationships, such as extramarital affairs, cohabitation, and homosexual relationships, have tenuous public acceptance and limited legal standing, and they face negative sanction within the larger community.

The Loss Is Not Acknowledged

In other cases, the loss is not socially defined as significant. Individuals experience many losses—some death related, such as perinatal loss, others nondeath related, such as divorce, incarceration, the loss of a job or material possessions, or a significant change in behavior that may be unacknowledged by others. There are many other types of loss, all of which may be profound but nonetheless may not be recognized or validated. Some may be intangible. For example, a teenager aspiring to a sports career and cut from a team or the parents of a child born with a developmental disability may experience a loss of dreams. Similarly, the loss of reputation, due to scandal, gossip, or an arrest, can be devastating. Even transitions in life can have undercurrents of loss. Aging, for example, leads to constant developmental losses such as the loss of childhood or other losses associated with different points of life.

The Griever Is Excluded

There are situations in which the characteristics of the bereaved, in effect, disenfranchise their grief. Here the person is not socially defined as capable of grief; therefore, there is little or no social recognition of his or her sense of loss or need to mourn. Despite evidence to the contrary, others typically perceive both the old and the very young as having little comprehension of, or reaction to, the death of a significant other. Similarly, mentally disabled persons may also be disenfranchised in grief.

Circumstances of the Death

The nature of the death may constrain the solicitation of the bereaved for support as well as limit the support extended by others. For example, many survivors of a suicide loss often feel a sense of stigma, believing that others may negatively judge the family because of the suicide. Similarly, the stigma of AIDS may lead survivors of an AIDS-related loss to be circumspect in sharing the loss with other.

The Ways an Individual Grieves

The way an individual grieves also can contribute to disenfranchisement. Certain cultural modes of expressing grief, such as stoicism or wailing, may fall beyond the grieving rules of a given society and thus be disenfranchising.

These examples and categories are meant to be illustrative of the many ways grief may be disenfranchised. They are neither exhaustive nor exclusive. An individual's grief may be disenfranchised for a number of these reasons. And, of course, this particular taxonomy draws examples attuned to contemporary Western culture.

Approaching the issue deductively, yet another taxonomy of disenfranchised grief addresses the question "What is disenfranchised in grief?" The answer to this question is that the state of bereavement, the experience of grief, and the process of mourning can all be disenfranchised.

Special Problems of Disenfranchised Grief

Though each of the types of grief mentioned in this entry might create particular difficulties and different reactions, one can legitimately speak of the special problems shared in disenfranchised grief. The problem of disenfranchised grief can be expressed in a paradox. The very nature of disenfranchised grief creates additional problems for grief, while removing or minimizing sources of support.

Disenfranchising grief may exacerbate the problem of bereavement in a number of ways. First, the situations mentioned tend to intensify grief reactions. Higher levels of guilt, anger, and confusion, for example, are often present in disenfranchised grief. Second, both ambivalent relationships and concurrent crises have been identified in the literature as conditions that complicate grief. These conditions can often exist in many types of disenfranchised grief.

Although grief is complicated, many of the factors that facilitate mourning are not present. In death-related losses, the bereaved may be excluded from an active role in caring for the dying. Funeral rituals, normally helpful in resolving grief, may not help here. In some cases the bereaved may be excluded from attendance. In other cases they may have no role in planning those rituals or in deciding whether to have them. In cases of divorce, separation, or psychosocial death, rituals may be lacking altogether. In addition, the very nature of the disenfranchised grief precludes

social support. Often there is no recognized role in which mourners can assert the right to mourn and thus receive such support. Grief may have to remain private.

Treatment of Disenfranchised Grief

In treating disenfranchised grief, it is critical to remember that it is treated as any form of grief, complicated by the fact that social support is limited. It is also suggested that the key to treating disenfranchised grief lies in analyzing what is known as empathic failure. Empathic failure refers to the factors that limit support, generating disenfranchisement. Once the cause of empathic failure is analyzed, therapists can devise interventions that develop or compensate for the lack of support. These interventions can include many modalities, including individual or group counseling, support groups, expressive therapies, or the therapeutic use of ritual.

Disengagement Theory

Disengagement theory states that it is beneficial to both society and the individual to participate in a process of withdrawal from meaningful roles and relationships as that person enters the later years of life. While the theory does not suggest that one should sever all ties with previous acquaintances and enter a hermit-like state of existence, it does suggest that an aging individual will be less bound by the social networks in which he or she was previously engaged, and a decreased level of involvement will take place at four levels. First, the number of people with whom the individual regularly interacts will be reduced. Second, the amount of interaction he or she has with those persons will be diminished. Third, the style of interaction will be changed due to the altered status that the older individual now occupies. Finally, and most importantly, as the frequency and quality of interaction with others is diminished, the older individual will become increasingly preoccupied with his or her own situation; society will withdraw from the individual just as he or she will withdraw from society.

The roots of disengagement theory can be traced to an article published by Elaine Cumming, Lois Dean, David Newell, and Isabel McCaffrey in 1960, and a more complete description of the theory was provided 1 year later when Cumming and William E. Henry published *Growing Old: The Process of Disengagement*. Using data from the Kansas City Study of Adult Life, the authors fleshed out the details of disengagement theory by presenting nine postulates and eight corollaries. Within the postulates, Cumming and Henry asserted that disengagement is universal, though the form it takes is influenced by the culture in which one lives. In addition, the process of disengaging can be initiated by the individual or society. However, the desire of one party to disengage does not necessarily mean that the other party is willing to comply. When this occurs, the desire of society usually outweighs the desire of the individual. The authors also emphasized that disengagement varies by gender because the central role of men in society revolves around instrumental tasks whereas the central role of women involves socioemotional tasks. As it relates to the study of death and dying,

two postulates are particularly relevant. Postulate 1 emphasizes the inevitability of death, though it also acknowledges that disengaging is a highly personal experience that reflects the individual's physiology, personality, and life situation. Postulate 7 describes how the proximity of death impacts the readiness of the individual, as well as society, to disengage from one another. When the individual recognizes that death is approaching, he or she begins to curtail certain activities and discontinue selected relationships. In addition, the nearness of death leads the individual to more focused reflections on the meaning of life.

Since its introduction in the early 1960s, disengagement theory has been heavily scrutinized by a number of behavioral scientists, many of whom argue that the underlying logic of the theory is flawed and that its basic tenets cannot be adequately tested with empirical research. Nevertheless, disengagement theory has played a major role in the emergence of the multidisciplinary field of gerontology (the study of the aging process) as well as the area of life span development due in large part to the role it has played in theory development. For instance, when disengagement theory was first presented, Cumming and Henry argued that an implicit theory of aging had shaped social-scientific thought for many years without being formally stated or adequately tested. In response, the implicit theory was formalized by Robert Havighurst and named activity theory. Once in place, the theory provided the polar extreme to disengagement theory because activity theory rests on the assertion that individuals want to remain as active in later life as they have been in their middle adult years. To accomplish this, when a role or relationship is lost it is essential that another one be identified to fill the void created by the loss of the previous role. This process allows for the maintenance of one's current level of social involvement while simultaneously encouraging the expansion of his or her social network. In stark contrast, disengagement theory emphasizes that as an individual ages, he or she desires to gradually withdraw from the roles and responsibilities that were held throughout adult life. Society encourages this withdrawal because it provides the opportunity for younger individuals to occupy positions of increasing power and importance.

In addition to contributing to the formalization of activity theory, reactions to disengagement theory have led to the emergence of other theories, including continuity theory, which states that adults seek to maintain the same activities, behaviors, and relationships in later life as they did earlier in life. In order to achieve this continuity, older adults modify strategies for dealing with life events that worked in the past in order to handle the situations they face in later life. Because continuity theory is a modification of activity theory, it is also diametrically opposed to disengagement theory.

Although many scholars have been critical of disengagement theory, its role in examining how people navigate the changes that accompany the later years of life must be acknowledged. As the first explicitly stated theory of aging, it prompted the development of additional schools of thought which have greatly enhanced our understanding of the human experience.

Domestic Violence

The term *domestic* means the house (*domus*) or home, and domestic violence broadly refers to the sustained abuse by one person of at least one other with whom he or she is in a personal relationship. The reference to the domus suggests a distinction between public (stranger violence) and private (domestic violence). Although it is possible

to examine how often domestic violence occurs (i.e., its *prevalence*) and how often it results in death, it is important to find a way of distinguishing among different types of domestic violence.

Relationships are one of the key defining features of domestic violence. These domestic relationships are more likely to be called intimate, personal, or family relationships, and one feature is that they somehow preclude the possibility of violence through care, love, or responsibility. To explore domestic violence in more detail, it is useful to distinguish between dyadic intimate relationships, such as in marriage, and those between generations, such as between a child and parents. It is also important to consider the sociopolitical context, which is often complicit in domestic violence and also attempts to deal with aftermath and prevent further violence.

Dyadic Intimate Relationships

When considering domestic violence, people most often refer to the abuse between two adults in an intimate, loving, and sexual relationship. This could include homosexual relationships, but it is often limited to heterosexual relations where the man is abusing the woman. Indeed, many more men than women are violent in intimate relationships.

Life prevalence rates in domestic violence usually calculate how many people will experience domestic violence. Globally, lifetime prevalence for women is 1-in-4 to 1-in-5, whereas it is much lower for men at 1-in-10 to 1-in-20. More specifically, crime figures for assault show that women are usually assaulted by their partner in an intimate relationship, whereas the vast majority of men report that their attacker was a stranger.

Similar differences are seen when domestic violence leads to mortality where there are almost 3 times as many women than men murdered by their partner. For example, homicide estimates in the United States suggest that in the year 2000 there were 1,247 women and 440 men killed by their partners. Many of the men murdered seemed to have been persistent perpetrators of violence, and therefore the murder was most likely a result of self-defense or provocation. Of those—mainly men—who do murder their partner, some also kill other members of the family (familicide) and, subsequent to the murders, a large proportion also kills themselves (homicide-suicide).

Relationships Between Generations: Older Abusing the Younger

In relations between different generations, there are at least two different directions of abuse. The first is the abuse of a child by an adult, which could be an adult within their family—a parent, uncle, aunt, or grandparent—or within their family's circle of friends. The term *child* would seem to suggest that this is limited to people below a certain legally defined age threshold (16 or 18, for example), but the relationship between generations—where the younger generation needs protecting and the older generation is responsible for its progeny—seems more important because it is unlikely that passing a certain age would define certain acts as less violent. As a child is often dependent upon older generations for survival, the persistent failure to provide for a child's psychological and physical health, termed *neglect*, is a prominent aspect of understanding relationships in which the older generations abuses the younger.

Most information on the prevalence of child abuse comes from countries with monitoring systems that include, or are specifically focused on, such abuse, most of which are in the West. For every 1,000 children there can be as few as 2 children abused, such as in the United Kingdom, whereas in other countries there are as many as 12 per 1,000 as in the United States.

It is difficult to track mortality related to child abuse because the adults responsible for the child, and the child's death, are unlikely to be forthcoming about the circumstances around the death. Overall, there seem to be about two child abuse fatalities per 100,000 children every year, although estimates suggest that 50% to 60% go unreported. For example, in the United States there were an estimated 1,530 child deaths that were due to child abuse in 2006. The younger the age of the child is, the greater is the proportion of deaths caused by child abuse. Most of those deaths are due to neglect and leave no evidence of physical abuse, although many fatalities combine multiple types of abuse (e.g., physical, sexual, neglect, psychological). Perpetrators are usually young, in their 20s, of low socioeconomic status, and have experienced

abuse themselves. Again, there are gender differences, as men usually enact physical violence, whereas women are usually guilty of neglect.

The example of the Austrian Josef Fritzel is instructive. Fritzel was 73 years old when police took him in for custody in 2008. It was revealed that he had imprisoned his daughter, Elisabeth, in his basement for at least 24 years, where she had seven children by him. Police reports suggest that his abuse of Elisabeth started when she was 11; she was 42 when finally released. While this case may seem rare in how horrifying it is, it demonstrates how abuse can be perpetrated over long periods and can involve multiple forms of violence from a man that many respected.

Relationships Between Generations: Younger Abusing the Older

The second direction of abuse between generations is the abuse of an older generation person by the younger generation. This is often limited to the abuse of elderly members of the family whose advanced age is seen as making them reliant on the younger generation. In such cases, the term *elder abuse* is used, although the term can also refer to abusers outside the familial unit, such as care workers. Exploiting someone to gain access to their financial resources, referred to as financial abuse, is a prominent feature in the understanding of elder abuse.

It is important to avoid focusing solely on older adults. Parent abuse or, more broadly, the abuse of an older member of the family by a younger member, has received greater attention since the development of activist and support groups in the past decade. Adults are often seen as retaining responsibility for the behavior of the minor, however, which means that the issue of whether a minor can abuse an adult remains contentious. Indeed, in cases of parent abuse the inability of the parent to control the minor may be interpreted as neglect and therefore as abuse of the child by the parent.

It is difficult to find accurate figures on the prevalence of elder and parent abuse because it often remains hidden and receives little official recognition. As with violence in other relationships, perpetrators are usually male and perpetrators often abuse women. Estimates suggest that around 5% of those at pensionable age experience abuse, particularly psychological abuse, with slightly smaller figures (2%) for physical and financial abuse. In contrast, estimates of those who are in regular contact with people of pensionable age suggest almost double are psychologically abusive (9%), whereas half (1%) enact physical abuse. The figures for parent abuse are comparable in that almost 10% of children under 10 years old appear to be abusive toward their parents. Physical violence seems to be used more often than that of a psychological nature. Abusive children are usually considered to be severely abused and/or either severely mentally ill or dangerously antisocial.

Elder abuse has received attention only since the 1990s, and parent abuse still remains largely unacknowledged. Thus, there are few reliable studies of mortality in relation to these two types of abuse. In crime statistics, however, there is a long tradition of recording parricide, patricide, and matricide, which are the murder of a parent or close relative, father, and mother, respectively. In such figures, the terms *parent* and *elder abuse* would seem to relate to the age of the child in question, particularly whether they can be considered to be a minor that is dependent upon their parents (in parent abuse) or an adult that is independent (in elder abuse). Accounting for 1% to 4% of all homicides, parricide is relatively rare, and the majority are patricides committed by a male child. Patricides are usually limited to biological and stepfathers rather than adoptive or foster fathers. Parricides usually seem to result from relationships that are highly conflictual where it often seems that the parent is abusing the child. As with murders of men by women in dyadic intimate relationships, this suggests that the murder was a result of provocation or self-defense. Consequently, mortality figures suggest that parent and elder abuse may be underlined by abuse from the parent in question, which may be one of the reasons these are not always recognized as forms of abuse.

An illustration of abuse in relationships in which the person from the younger generation is abusing someone of an older generation is found in the patricide of Takeo Aizawa in Japan. At first, it appeared that Takeo Aizawa was murdered in 1968 by his wife. It emerged that he was murdered by his eldest daughter whom he had been sexually

abusing for over 15 years and kept in such a way that many thought she was his wife, and with whom he had five children. This case of long-term persistent abuse that was missed by neighbors and friends shows how complex the abuse in relationships can be. What at first appears to be murder in a dyadic intimate relationship is actually child abuse, and so it is possible that the abuse of older generations in domestic relationships remains hidden by other factors that seem to take precedence, such as the responsibility of older generations toward their progeny.

Future Directions

In some respects, domestic violence is no longer a contentious issue because, in many countries, it is unacceptable to openly advocate domestic violence and there is a vast amount of scholarship dedicated to exploring it. More importantly, there are a number of policy instruments in place that demonstrate the political legitimacy of recognizing and developing responses to domestic violence. For example, the United Kingdom has a policy on domestic violence entitled Safety and Justice, and Aotearoa/New Zealand has legislation devoted to domestic violence. Both of these examples, and many other policy responses to domestic violence, are linked to the UN Convention on the Elimination of all Discrimination Against Women (CEDAW), which is over half a century old and, even though it is limited to women, has been a major international instrument for dealing with domestic violence. Thus, the social supports sanctioning domestic violence are slowly being chipped away. CEDAW's focus on women, however, signals what is still contentious, and this is domestic violence's connections to deeper structural issues, particularly gender and power, which are much more difficult to elucidate. Even though most of the work advancing scholarship on domestic violence has come from feminists, there is still a reluctance to think in terms of gender as a socially constructed category that is intimately intertwined with the abuse of power. Indeed, as domestic violence is increasingly taken up by other interest groups, such as those against elder or parent abuse, the terms by which it is defined are likely to fragment, and gender will become one issue alongside a series of others.

Drug Use and Abuse

The use of psychoactive substances is a common feature of all human societies, and these drugs have been used throughout human history for medicinal purposes, pain control, religious rituals, and personal pleasure. Notwithstanding the "war on drugs" metaphor of recent decades, drug use and abuse are not problems of late modernity but rather problems from antiquity. Nevertheless, drug use and abuse take an immense economic and social toll on society in terms of society's criminalizing response to those who use and abuse these substances, the morbidities and mortalities associated with their usage, and the familial dysfunction and community disintegration common to those with addiction troubles. Drugs are viewed as a scourge on society, on morality, and on social order, and because of this viewpoint, there is a long history in the United States of battling this problem.

The terms *drug abuse* and *drug use* speak to very different concepts, although historically they

have often been conflated in the policy and public rhetoric on illicit substances, especially around the use of marijuana. A drug user is not necessarily a drug abuser. Indeed, the American Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders, Fourth Edition,* defines drug abuse by the following four markers: (1) the failure to maintain and discharge one's role requirements, (2) the frequent use of illicit drugs in settings that are dangerous or hazardous, (3) having multiple legal problems, and (4) experiencing recurring social and interpersonal crises. On the other hand, a drug user is someone who frequently or occasionally uses psychotropic substances but is not dependent on them. Ostensibly, a drug user can give up his or her use of illicit drugs, but addicted individuals (i.e., those who abuse drugs) cannot easily accomplish this. Throughout the history of laws on drug use and abuse in the United States, there have been few attempts to differentiate between the recreational user and the everyday, freewheeling addict; this is particularly acute in discourses on marijuana use, especially where federal and state laws treat both recreational users and addicted abusers as criminals.

History

Humans have a long storied history with psychoactive plants and synthetic chemicals. The fathers of Western medicine, Hippocrates and Galen, prescribed plants with medicinal properties such as *Papaver somniferum*, the poppy flower, for a host of physical and psychological ailments, from asthma to chronic sadness. During the Industrial Revolution in Europe, laudanum, which was a tincture of alcohol and opium, was widely prescribed and used for its painkilling and healing properties. Opium was so important to international commerce that the British fought two wars, the first from 1839 to 1842 and the second from 1856 to 1860, over China's efforts to enforce Prohibition and to end British monopoly of the trade.

In the Americas, *Erythroxylum coca,* or the coca leaf, from which the drug cocaine is derived, played an important role in Inca rituals and religious funeral rites and was used for medicinal purposes. Native Americans in the U.S. Southwest and indigenous groups in Mexico employed, and continue to use, the peyote cactus and a host of hallucinogenic mushrooms in sacred rituals and religious ceremonies. The *Cannabis sativa* plant, commonly known as marijuana, has been used throughout most cultures as a medicinal, ritual, and pleasure-producing substance. Almost all human societies, including those of India, China, Africa, the Middle East, and the Americas, have a recorded antiquity with the plant, dating back to 4000 B.C.E.

The recent history of psychotropic substances in pharmaceuticals and over-the-counter products is telling. Coca-Cola soft drink was sold with cocaine until the early 1900s, and a host of mail order medicines came laced with heroin, cocaine, and opium. In fact, the Bayer Company once employed heroin as the primary ingredient in its painkilling and cough suppressant "medicines," and Smith Kline sold the "American Cannabis" brand of marijuana legally in the 1920s and 1930s before federal prohibition statutes were enacted.

America's most notable contribution to the worldwide use and abuse of drugs came in the form of the "stinking weed," tobacco. Columbus was introduced to the plant by the indigenous inhabitants of the newly discovered Americas, and it quickly spread to Europe. Tobacco was arguably the most important cash crop in colonial America as it was to the newly independent confederation of United States. In recent times, tobacco has experienced a slate of federal and state regulations on its sale, marketing, and use, and has been the source of important class-action litigation to recover monies from cigarette companies for the substantial medical costs of treating the morbidities associated with the habit. Finally, the cultivation of grapes for wine and grain for beer has been a part of human history dating as far back as 6400 B.C.E.

Prior to 1914 and the passage of the Harrison Narcotic Tax Act, the United States did not have any comprehensive federal laws prohibiting the use, manufacturing, distribution, and sale of illicit drugs, particularly cocaine and heroin. There was a patchwork of state laws and the 1909 Smoking Opium Act, which prohibited the importation of opiates, but these laws said nothing about possession for medical use or their pharmaceutical application in medicines. The Harrison Act, sponsored by Representative Francis Burton Harrison of New York, imposed a tax on the distribution of a wide range of opiate and coca-based products while

imposing strict prohibitions on how doctors could use these drugs in treating health ailments, particularly addiction itself. The Harrison Act was quickly followed by laws on alcohol prohibition between the years 1920 and 1933, the Marihuana Tax Act of 1937, and the Boggs (1951) and Daniel (1956) Acts, which increased penalties for drug use. But it was under the Nixon administration in 1970 that the United States officially declared a War on Drugs with passage of the Comprehensive Drug Abuse Prevention and Control Act. This act defined five schedules of drugs, from those with little medicinal benefit and having a high potential of being abused, to drugs like over-the-counter medications that are fairly benign. It also required the pharmaceutical industry to retain precise records on the distribution of controlled drugs and boost security for keeping these substances safe. The Comprehensive Drug Abuse Prevention and Control Act consolidated several laws on a range of illicit drugs, including anabolic steroids. Then in 1988, the U.S. Congress passed the Anti-Drug Abuse Act that led to the creation of the Office of Drug Control Policy.

In addition to the long history of statutes criminalizing the possession, usage, distribution, and sale of narcotics in the United States, there have also been noteworthy laws that have expanded treatment options for drug-dependent individuals. For instance, 1973 saw the introduction of the Methadone Control Act, which introduced the methadone maintenance treatment option to assist opiate-addicted individuals with their recoveries. In 1996, California passed Proposition 215, the Compassionate Use Act, which allows chronically and terminally ill patients to procure and/or grow medically prescribed marijuana without fear of state prosecution. And in the year 2000, Congress passed the Drug Addition Treatment Act, which allows certified physicians to prescribe narcotic substitutes for the treatment of opiate addiction, such as the drugs methadone, buprenorphine, and LAAM (levo-alpha-acetylmethadol).

Prevalence

The Substance Abuse and Mental Health Services Administration (SAMHSA), under the auspices of the Department of Health and Human Services, is the federal body charged with conducting annual epidemiological surveys on the prevalence of illicit drug use in the United States. SAMHSA surveys ascertain information on the number of Americans who are current users, that is, people who have used a substance, whether illicit or licit, over the past month.

The most recent SAMHSA survey report, *Results From the 2006 National Survey on Drug Use and Health: National Findings*, states that an estimated 20.4 million Americans were current users of illicit drugs, or about 8.3% of the population over the age of 12. These Americans used an illegal drug such as marijuana, heroin, cocaine, hallucinogens, or methamphetamine in the month preceding the date of the SAMHSA study. The survey also found that the most prevalent illicit substance was marijuana, with 14.8 million persons, or 6% of the population over age 12, using this drug in the previous month. SAMHSA data also show that about 1 million Americans used a hallucinogen, 7 million used a prescription-based psychotherapeutic, 2.4 million used cocaine, and 731,000 individuals used methamphetamine in the month prior to the survey. The results for youth between ages 12 and 17 show that in 2006, 9.8% had used an illicit substance in the previous month, down from 11.6% in 2002.

In addition to collecting information on the use of legal drugs, SAMHSA also collects epidemiologic data on the use and abuse of licit drugs, namely alcohol and tobacco. The 2006 survey of legal drug use shows that 50.1% of Americans over the age of 12 are current users of alcohol and that 6.9% of Americans are heavy drinkers, bingeing on at least 5 days over the past month. And 72.9 million Americans, or 29.6% of the population over age 12, reported they were current users of cigarettes, pipes, cigars, and/or chew tobacco.

As a whole, SAMHSA data shows that in 2006 an estimated 22.6 million people, or 9.2% of the population over the age of 12, were struggling with drug abuse or substance dependence problems as defined by the DSM-IV criteria of drug abuse, a rate that has remained constant since 2002. Not surprisingly, marijuana leads among illicit substances as the drug with the most abuse problems (4.2 million abusers) followed by cocaine (1.7 million abusers).

Besides the SAMHSA data on prevalence, the National Institute on Drug Abuse collects

information on epidemiologic and geographic trends in drug abuse through its Community Epidemiology Work Group (CEWG). This body, which has been the preeminent narcotic surveillance system since the 1970s, collects information on the abuse of six illicit substances (cocaine/crack, heroin, opiate-based substances, marijuana, methamphetamine, and MDMA [ecstasy]) from 21 standard metropolitan statistical areas across the United States, including Atlanta and New Orleans in the South, Minneapolis/St. Paul and Detroit in the Midwest, New York City and Newark in the Northeast, Phoenix and San Diego in the Southwest, and Seattle in the Northwest, in addition to other cities. The CEWG results from the 2006 survey show regional differences in, or preferences for, illicit drugs of choice. For instance, heroin abuse is particularly acute in the northeast United States, especially in the cities of Baltimore, Boston, New York, and Newark. Cocaine/crack abuse, although prevalent throughout much of the United States, is especially acute in Atlanta, Miami/south Florida, New Orleans, Washington, D.C., and Texas. Methamphetamine dependence was highest in Honolulu and San Diego, but saw increasing abuse in 2006 in the midwest metropolitan area of Minneapolis/St. Paul and in Los Angeles and Denver. And as for marijuana, it continues to lead all other illicit substances as the most frequently abused and used illegal drug in all 21 areas under CEWG surveillance.

Mortality/Morbidity

Drug use and abuse is a subject of major thanatological interest if only because of the incidences of mortality each year from the use of both illicit and licit substances. The Centers for Disease Control and Prevention (CDC) lists unintentional poisoning as the second leading cause of unintentional injury deaths in the United States, with 20,928 deaths in 2004 and 23,592 deaths in 2005. In addition, the CDC reports that "nearly all" deaths from unintentional poisoning are the result of drugs and that most of these drug-related deaths are due to the decedents' abuse of either illegal narcotics or prescription drugs. CDC mortality data for unintentional poisoning in 2004, by type of substance, shows that there were 9,798 unintentional deaths attributed to narcotics and hallucinogens (heroin, opioid analgesics, cocaine, etc.) and another 8,506 unintentional deaths attributed to other drug overdoses (sedatives, etc.). Altogether, the 18,304 unintentional poisoning deaths attributed to drug overdoses in 2004 represent an increase of 44% over the 10,295 unintentional drug overdoses in the year 1999. The aforementioned statistics mainly represent reports on illegal narcotics. The mortality figures for lawful drugs are much more pronounced.

In 2006, 418,000 deaths were attributed to the use of tobacco products, mostly from malignant neoplasms, cardiovascular disease, and respiratory disease, making tobacco consumption the leading cause of preventable death in the United States. On the other hand, the CDC reports that excessive alcohol consumption is the third leading cause of preventable mortality, with about 80,000 deaths per year that are alcohol-attributable deaths, that is, morbidities such as alcoholic cirrhosis of the liver, ischemic heart disease, and liver cancer. Moreover, alcohol-related traffic fatalities account for nearly 40% of all vehicular deaths in the United States, close to 17,000 deaths each year.

The incidence of morbidity associated with drug use and abuse varies by the type of drug in question and the mode and pattern of use or abuse. Some drugs and modes of use carry significant risk of illness, not to mention death. Heroin, above all illicit drugs, is associated with some of the most life-threatening viral morbidities. Heroin use and abuse typically begins with addicts snorting the drug and only later proceeds to the intravenous mode because of the intense "high" associated with injection drug use. However, once the mode of use changes from nasal ingestion to intravenous injecting, morbidity and mortality risks dramatically increase.

Epidemiological surveillance on injection drug users finds that HIV/AIDS, hepatitis C, and hepatitis B continue to afflict this population in disproportionate numbers, largely because of the sharing of hypodermic syringes among opiate-addicted individuals. Injection drug users accounted for 14% (5,292) of the 37,164 newly diagnosed HIV infections in 2005. CDC statistics report that 50% to 80% of heroin addicts will become infected with the hepatitis C virus within 5 years of the start of their drug use, and hepatitis C virus is a major contributor to liver cancer and cirrhosis.

Accordingly, blood-borne and other infections, such as bacterial pneumonia, skin infections, and endocarditis, are morbidities that too often result from the sharing of used needles.

Given the serious risks of morbidity and mortality associated with injection drug use, it is startling that more needle exchange programs are not in existence across the United States. Intravenous drug users share because of the scarcity of available clean needles. One approach to reducing the high rates of HIV, hepatitis C virus, hepatitis B virus, and other viral and bacterial infections that afflict drug users and abusers is to encourage needle exchange programs in areas where the intravenous mode is high. But although the epidemiological evidence suggests that needle exchange programs work in reducing viral infections commonly associated with injection drug use—and even though the CDC has called, since 1997, for reform in syringe laws to remove the legal barriers that prevent needle exchange programs from operating—the U.S. federal government refuses to fund these programs. As of 2006, there were 185 needle exchange programs in the United States, but many were illegal and all were operating without federal funding.

Treatment

SAMHSA reports that in 2006, 4 million Americans, age 12 and older, received treatment for a drug-related problem. Moreover, alcohol was the most common drug for which individuals sought treatment, with some 1.2 million receiving treatment for alcohol abuse and 1.6 million receiving treatment for a combination of alcohol and illicit drug abuse. Once the decision has been made to seek help for drug abuse, affected individuals have several treatment options: (a) detoxification and rehabilitative therapies, (b) substitution treatments, (c) private doctor's office, and (d) self-help support groups, such as Alcoholics Anonymous (AA) and Narcotics Anonymous (NA); the last of these is the most common treatment option.

The medical model of drug use and abuse presupposes that addiction is a disease and, as such, is a condition that can be medically treated. But under the medical model, arguments continue about whether drug addiction should be treated as a chronic condition, with appropriate pharmacological interventions to manage cravings, or whether substance abuse should be seen an acute, or temporary, condition that should be assuaged with detoxification, group counseling, and rehabilitative therapies. Consequently, there are two competing paradigms on drug addiction which encapsulate this debate: the harm reduction and the demand reduction approaches to drug abuse treatment.

Advocates of the harm reduction approach generally ascribe to the view that the primary focus of treatment should be on reducing the negative effects of addiction, such as the high rates of viral and bacterial morbidity and mortality associated with injection drug use. The best exemplar of this approach is substitution treatment. Substitution is an approach whereby the addict is given a pharmaceutical substitute to replace his or her illicit drug of choice. Under substitution treatment, an addict might also receive counseling in the form of group and individualized therapy. Substitution treatments usually employ a synthetic pharmaceutical such as methadone, buprenorphine, Suboxone (high-dose buprenorphine), or naltrexone that blocks the effects of the drug on the brain. While on these substitutes, the addict will not be able to experience the euphoric sensation that heroin has on the brain's pleasure receptors.

The most common substitution therapy in the United States is methadone maintenance treatment; about 110,000 individuals receive daily doses from methadone clinics. Another substitution therapy is heroin maintenance, whereby opiate-addicted individuals receive a "daily dose" of pure heroin administered by a clinician. A few heroin maintenance programs exist in Germany and the Netherlands, but the vast majority of European programs, for their 300,000 substitution patients, administer a synthetic pharmaceutical. Finally, another type of harm reduction approach is the needle exchange program, whereby opiate-addicted individuals can exchange dirty needles for clean ones without fear of arrest and prosecution.

Advocates of the demand reduction treatment approach, by contrast, tend to favor strategies that stress rehabilitation in conjunction with complete detoxification and sobriety. Demand reduction treatments usually require a period of detoxification followed by rehabilitation therapy that typically involves individualized and group counseling and encourages participation in a sobriety

commune, like Narcotics Anonymous (NA) or Alcoholics Anonymous (AA). The demand reduction approach, especially as advocated by NA and AA, sees recovery as a perpetual state wherein the addict must be forever vigilant against falling back into drug use and abuse behaviors.

Some advocates of the demand reduction approach, which is favored by U.S. policymakers, see substitution treatments as simply substituting one addiction for another, since drug-addicted individuals frequently become dependent of these pharmacological substitutes, especially methadone. Other demand reduction supporters believe that harm reduction therapies, such as needle exchange programs or heroin maintenance, enable and encourage bad behavior.

Drug use and abuse are intractable problems in society with no clear solution in sight. The thanatological importance of this subject is profound and unassailable given the level of morbidity and mortality from drug use.

DUELING

Dueling is a ritualized form of combat used to settle an honor conflict between two individuals. In Western societies, key elements in a duel often include the original offense to a person's honor, or social reputation; the use of seconds, or witnesses, in the communication between the offended parties; and the ceremony of the duel itself, often facilitated by the seconds and where participants select arms and subsequently engage in brief, organized combat. A duel has concluded when blood has been shed, when one of the participants is too wounded to continue, or when someone has died. Although this more ritualized form is rarely practiced today, dueling has become a common term denoting competition for dominance between two individuals or parties. The triumphant party acquires vindication or fame. Failure to participate leads to social death as a result of the loss of honor or reputation. In addition, vestiges of the duel emerge in contemporary culture in the form of fights between individuals or groups seeking dominance, the restoration of their reputation, or revenge. Examples of this include gang conflicts or honor killings.

General Dueling Scenario

In general terms, a duel arises through the following process. An individual suffers an insult to his or her honor. Offenses may be verbal, such as an implication of cowardice for a man or impurity for a woman, or physical, such as tugging on a man's beard, slapping him in the face, or seducing a woman in his family. Once the insult has occurred, the offended party issues a challenge demanding satisfaction through a duel. The other party faces high pressure to accept this challenge or risk being viewed as a coward by society. Because duels are often illegal but socially accepted, participation in one shows that both parties value their honor more than

the law and even their lives. Once the challenge has been accepted, both parties agree upon a time and place to meet for a clandestine combat. The seconds serve as representatives for the offended parties in all communication and also participate in the dueling ceremony, which includes selection of equal weapons. Depending on their selection of weapons, participants may engage in a sword fight, exchange shots with pistols, or use some other type of combat. Once the duel has concluded—that is, when one member sheds blood, becomes too wounded to continue, or is dying—honor is restored for both parties.

History of Dueling

The modern duel's origins have been traced back to the Middle Ages after the fall of the Roman Empire with the emergence of its antecedent, the judicial duel, or trial by combat. V. G. Kiernan notes that the development of the judicial duel occurred in the context of a feudal society. The high level of competition among nobles led to disputes among groups, and trial by combat offered an alternative to acts of revenge or large battles between these groups. Elements from the modern duel, including the issuing of a challenge and the selection of weapons, appear in the judicial duel. In addition, the phrase "throwing down the gauntlet," or challenging an opponent, appears during this time. It was believed that the outcome of the judicial duel was determined by divine intervention, and the guilty party would either die in battle or, upon losing, would face additional punishment.

Initially approved by kings and other rulers to settle legal disputes, the duel eventually encountered opposition from the Catholic Church and, later, civil authorities. Both viewed the duel as a threat to divine and legal authority. Nonetheless, dueling continued and morphed from the joust of knightly Europe into the clandestine duel of honor during the Renaissance.

With the duel of honor, the use of armor and horses was discarded, and participants stood on their own two feet, wielding simpler weapons, such as swords and (later) pistols. Rather than fight in a tournament before a crowd of spectators, duelists met in secret locations, often at dawn, to settle their disputes, because dueling had become illegal in many places. During the late 15th century the conditions for settling disputes with dueling began to be written down in honor codes. Girolamo Muzio's *Il Duello,* published in 1550 in Venice, is one of the more famous codes, and the term *duel* is adapted from the Italian, which originated from the Latin word for war: *duellum*. Treatises described the types of offenses that justified dueling as well as various regulations for dueling ceremonies, such as the selection of weapons and who could stand in if a participant was unable to fight.

Dueling proliferated throughout Europe during the 17th century, in part due to the influence of the Thirty Years War from 1618 to 1648, despite ecclesiastical and legal opposition. Laws prohibited dueling and even mandated that it be punishable by exile or death, though enforcement was inconsistent at best. Dueling's prevalence extends to literature, especially in plays by Spanish authors such as Lope de Vega and Calderón de la Barca (1796).

Although the number of duels fought decreased during the 18th century, its influence continued in culture. For example, dueling appeared in novels such as Samuel Richardson's *Clarissa* (1747–1748) and Pierre Choderlos de Laclos's *Les Liaisons Dangereuses* (1782). However, the French Revolution of 1789 regenerated interest in the practice of dueling and also democratized it. Members of the aristocracy continued to use the duel to settle disputes, but an increasing number of members of the military and middle class also participated.

During the 19th century, dueling initially increased in action and cultural representation in Romantic literature. In the United States, dueling acquired a more public flavor, and many duels had spectators. The most famous duel in U.S. history occurred in 1804 when Alexander Hamilton was killed by Aaron Burr. Dueling first fell out of favor in the North, but continued to be associated with Southern culture. By the end of the 19th century, duels were rare in both Europe and the United States, though isolated examples continued well into the 20th century.

Implications for Contemporary Culture

Although duels of honor are now rare, their influence in contemporary culture appears in

numerous ways. The notion of dueling as a contest for fame or dominance between two parties often emerges in various competitions during which opponents face each other one-on-one. In addition, revenge killings, occurring outside the sphere of the law, reflect a compulsion to attain satisfaction for an offense. John Grisham's *A Time to Kill* (1989) centers itself around such a situation. Such behavior suggests that many value honor more than the law or their own lives, because they believe a physical death is more tolerable than a social death.

Economic Evaluation of Life

The economic evaluation of life encompasses the costs associated with death, the amount people and governments pay to reduce risk of death, and the appropriate compensation for wrongful death. Costs associated with death are an accounting after the fact, often one restricted to tangible costs that ignore quality-of-life loss. The amount paid for risk reduction mirrors the value placed on death before the fact. Compensation for wrongful death is driven by deterrence, providing incentives to be diligent with other people's lives. It is constrained by widely varying state laws. This entry excludes the topic of life insurance, as it is not a valuation of life. Rather, life insurance shows how much money risk-adverse families and businesses choose to invest to ensure survivors will be able to meet their financial needs if someone dies. Some people also buy life insurance to impose discipline on their effort to provide an inheritance. Thus, life insurance purchasing does not reflect how people intrinsically value their lives.

Costs Associated With Death

Death imposes costs on survivors, employers, and governments. The venerable method of valuing these losses was stated by Adam Smith in his 1776 classic *Wealth of Nations*: A man is valued by what he produces, his *human capital*. In practical terms, that meant people were valued by what they were expected to earn during their remaining life span. Over time, that definition expanded to include the value of household work such as cooking, cleaning, maintenance, yard care, and child care. Direct costs were added for emergency services, such as police, fire, and emergency transport; medical treatment prior to death; investigation of fatal incidents; coroner and medical examiner services; and funerals, as well as employer costs to hire and train replacements for deceased employees.

Despite those expansions, human capital costs have severe limitations. They lack a theoretical basis. They fail to value pain, suffering, lost quality of life, loss of consortium and companionship, and loss of unique skills. They place minimal value on retired people, and because of wage discrimination, they undervalue women and minorities relative to white males. Men, for example, earn 25% more than do women in comparable jobs.

Value of Risk Reduction

Basing public policy choices on a method with such obvious gaps and biases is not appropriate. In the 1960s, a new economic paradigm emerged when Jacques Dreze and Thomas Schelling suggested that policy analysts should value a person's life based on the amount the person was willing to pay for a reduced probability of dying.

Unavoidably, everyone takes risks. But most individuals view life as sacred and willingly spend large sums to save people whose lives are at risk. Search and rescue operations, space shuttle fail-safe measures, and heart transplants are viewed as heroic measures, regardless of their cost. Although

policymakers recognize this view, they need to make decisions about anonymous lives and daily risks. Economists assume people behave rationally in response to the risks they perceive and understand the consequences if risk taking leads to illness, injury, or death. With those assumptions, risk behavior reveals the value of risk reduction. Assuming rationality prevails, risk reduction values show how people value preventing deaths.

Challenged by Schelling, economists developed values. Some asked people what they were willing to pay for risk reduction. Others analyzed risk reduction markets. All began to probe (a) the extra wages paid to induce people to take risky jobs; (b) the demand, price, and perceived effect on risk of bicycle helmets, smoke alarms, cigarettes, and other products that affect health and safety; or (c) the trade-offs people make between time, money, comfort, and safety (e.g., in choosing how fast to drive on an open road). These analysts learned what people actually pay for small reductions in their health and safety risks. Actual payments are more concrete and more credibly measurable than survey responses about what one would be willing to pay, yet they are equally acceptable from a theoretical viewpoint.

The values were named *willingness to pay,* which is so nebulous that it raises immediate doubts about the method for most people. Summing people's risk reduction payments, economists compute what a group actually pays, and therefore is willing to pay, in the expectation of saving a life (e.g., what 10,000 people pay for a 1 in 10,000 reduction in fatality risk)—the *value of statistical life* or, stated in another way, the value of an anonymous life.

More than 100 studies have assessed anonymous life values, providing more than 250 estimates. Systematic reviews of the values suggest they vary with income. Calculating the best estimate for 2008, for example, suggests the value of an anonymous American was approximately $6 million. The credible range is from $5 million to $8 million.

Quality of life dominates anonymous life values. Lost wages and household work account for only one sixth of the total. Although one fourth of all medical spending typically occurs in the last year of life, medical expenses average about 1% of fatality costs.

Anonymous life values are family values. Spouses, parents, even children influence safety belt use, speed choice, and decisions about high-risk employment. Because the value of an anonymous life is a family value, it excludes costs compensated by government and insurers—lost taxes, wage replacement, and most direct costs. Those exclusions total less than $500,000. Public valuation of an anonymous life would add these costs to the family value.

Individual Versus Statistical Lives

These values should be cast in the context of Broome's paradox: Widely accepted risks that would result in anonymous deaths are not acceptable if the lives at risk are not anonymous. With a known life, not only do the individual's attributes become relevant but emotion may overwhelm rationality. As Schelling observed, avoiding the death of a particular person is not simply a market transaction. Guilt, social responsibility, morality, and religious beliefs come into play once the person who would die is known. Personal characteristics and relationships also gain relevance.

Partially due to Broome's paradox, assuming the value of risk reduction and the implied value of an anonymous life, revealing the cost of deaths that already have occurred is controversial. Rationality demands variation in values between individuals. Scoundrels should be valued less, saints more. People's views of, experiences with, and valuations of an individual may differ radically, muddying the person's value from a societal viewpoint. Moreover, 100,000 one-in-a-million risks of death may be valued much less than a one-in-ten risk of death. As certainty nears, the threat becomes more tangible and avoidance rises disproportionately in importance; the value of an anonymous life, thus, represents a lower bound on the postevent value placed on the average decedent.

Risk Reduction Decision Making

Sound public policy on health and safety requires comparing the costs and savings from intervention and trading off risks. Implementing every conceivable protection is unaffordable. It also is economically inefficient. For example, the U.S. Department of Labor's 1987 standard on occupational

exposure to formaldehyde cost $400 million per life saved. That expenditure diverted funds that firms and their workers would have spent on other things, including health and safety measures with a lower cost per life saved. Research suggests that $20 million to $25 million in government-mandated or direct government spending on risk reduction costs someone his or her life. Sometimes implementing a risk reduction measure also directly increases other risks. For example, road improvements to improve safety can cause fatal construction-related crashes. Decision analysis should weigh all the risks and benefits.

Compensation for Wrongful Death

Regulatory decisions value death differently than does the tort system. The law primarily compensates individuals for their losses. If compensation for wrongful death were only for the sometimes minimal losses of surviving family, it would be much cheaper to kill someone than to maim that person. States address this moral hazard. Some states allow compensation to the estate, standing in place of the deceased. Others prescribe what compensation is due to survivors. The categories of damages that may be compensated vary, and the methods of computing these damages sometimes are dictated. Courts impose additional computation rules. In the courts, compensation for lost quality of life computed from the value of an anonymous life is called *hedonic damages*. The first hedonic damage claims were made in the mid-1980s. They are gaining some acceptance, but many states disallow them.

Because wrongful death compensation is bound by legislative fiat, studying these awards does not reveal the costs associated with death. Analysts interested in juries' willingness to award instead study the value of an anonymous life used in compensating nonfatal injury. Excluding punitive damages, they are able to explain 22% to 38% of the variation in jury awards based on the percentage of quality of life lost. Adding other explanatory variables—such as age, gender, contributory negligence, whether the defendant had deep pockets, and whether experts were used—raises explanatory power above 50%. Willingness to award ranges from $3 million to $6 million per life lost. It is higher for assaults and injuries caused by drunk drivers than for unintentional injuries caused by consumer products.

Economic Impact of Death on the Family

The economic impact of death can largely be described in terms of life insurance needs. Life insurance policies provide financial resources to absorb the economic shock to surviving families. Depending on the family situation, the purchaser of the life insurance policy, usually an income provider, identifies the financial needs of their surviving family and loved ones in the event of the income provider's death. Life insurance pays death benefits to those who were financially dependent on the deceased to cover income replacement, final expenses, readjustment-period needs, debt repayment, college-expense needs, and other special needs. Final expenses occur immediately before or after death. The readjustment period is the time needed by the surviving family to adapt to the physical and, in the case of an income earner or provider, the financial void caused by the death of a loved one. In

general, the need for life insurance decreases as families get older and assets accumulate over the life course.

This entry describes the loss of income at the death of an income provider, final expenses, readjustment period, and other unmet financial obligations of deceased providers. Coping strategies in the financial life cycle and other death benefit programs—such as prepaid funeral arrangements, burial societies, and welfare programs—are also discussed. The customary practice of wife inheritance in Africa, which was designed to ensure widows and surviving children are provided for economically, is described as an example of cultural differences in strategies and programs used to mitigate the economic impact of death.

Loss of Income

Upon the death of an income earner, the immediate impact is the loss of income. Life insurance planners estimate that, to maintain the same living standard, survivors need to replace about 75% of the deceased's after-tax annual income, as the family's expenses are reduced by 20% to 25% due to the death of that family member. Surviving spouses and partners must adjust to income loss over a period of time, which varies depending on the circumstances of the death (whether the death was anticipated or sudden) and the survivors' economic dependency (whether the survivors are partially or solely dependent on the deceased's income).

In the final stage of life of most retirees, there is no regular income from paid or self-employment. Retirement savings, investments, and insurance policies (such as health insurance and long-term care) provide resources for later life and the end of life, but if death is premature, these reserves are often inadequate to absorb the economic impact of death on the family. Younger families need to avoid tapping into such assets because they may be needed for special goals such as college expenses or the retirement income of a surviving spouse. The temptation to use these funds is greatest when there is no life insurance policy. Funds held by the deceased in savings accounts, investments, retirement plans, and pensions can be used to pay for final expenses and readjustment expenses.

Final Expenses

Final expenses, usually comprising burial costs, occur in the event of any death, whether of an income provider, dependent, or a young child. Obvious pre-death final expenses include uninsured medical expenses for terminal illnesses. Medical expenses for deaths attributed to illness or injury comprise out-of-pocket payments for uninsured health care, deductibles, and copayments. Burial costs include the professional services of the funeral director and other staff for visitation and graveside services and transportation, embalming, burial clothing, and other preparations of the body. Other funeral costs include the casket or cremation urn, the tombstone, rental of facilities, floral arrangements, travel, accommodation, and food. "No-frills" funerals cost about US$10,000; cremations cost less.

Readjustment Period

In the readjustment period after the death of an income earner or adult, surviving family members develop strategies to become self-reliant, to manage the household, and to live within their reduced financial means. This period can last a month or several years, depending on the family situation. Longer readjustment periods are typical when death is unexpected, if surviving partners are unemployed, or if there are young children. Survivors may need to obtain education or training before entering the labor force. Some survivors have to work part-time or stop working to care for minor dependents. Households that have experienced premature adult death tend to allocate more time to child care, which could mean reduced working hours and reduced wages for working survivors. It has been found that in most households where there has been a death of an income provider, there is a decrease in the average daily time for nonfamily productive activities, especially among the higher educated. However, child care costs can also increase in families in which the deceased was employed and the other parent, who previously stayed home to care for the children, now has to work outside the home. Other family members may use the readjustment period to receive counseling to cope with the loss, especially if it is an unexpected loss or the loss of

a young child. Counseling costs are therefore also a consideration for some survivors.

Financial Obligations of Deceased Providers

Debts are not written off by the death of the borrower. Mortgages and car loans must still be paid by co-borrowers or through the dissolution of the borrower's estate. Unpaid credit card balances and other loans must be paid off or settled. Unmet education loans of the deceased, spouse, and/or children must also be paid. The economic impact of death can also affect the future needs of survivors because the death of a provider is also the loss of future income or savings to pay for college expenses for surviving children, spouse, or both. Other special needs may be required, such as extra coverage for wealthier families who have to pay estate and inheritance taxes, or medical needs for dependents with chronic medical conditions.

Coping With the Economic Impact of Death and the Financial Life Cycle

Several coping strategies are adopted by households and families to mitigate the economic impact of the death of an income provider. Across all income groups, researchers found significant reductions in savings and investments by affected households. Lower-income surviving families are more likely than are wealthier survivors to reduce expenditure on consumer durables and sell assets to raise or supplement income. Some families may increase their debt burden if they have open lines of credit, such as home equity and credit cards, which they may use to cope with living expenses after the death of a provider, especially if life insurance assets and death benefits are inadequate or not available.

In their life cycle hypothesis, Ando and Modigliani proposed three stages of an ideal or typical individual's financial life cycle. During the first stage, individuals accumulate human capital in the form of education and training in anticipation of higher income. Once education is completed and employment begins, in the late teens or early 20s for college graduates, the financial life cycle really begins. The first stage can be decades long and centers on the accumulation of wealth in the form of increasing income, with career experience, and the accumulation of assets. Goal setting, income protection and insurance of assets, home purchases, and family formation get the spotlight in terms of financial planning.

During the second stage, which for some people may begin in their early 50s, financial goals shift to the preservation and continued growth of accumulated wealth. The highest income or peak of an individual's career usually occurs in this stage. Estate planning may become a consideration for those who wish to pass wealth to their heirs. The third and final stage is retirement, which typically begins in the mid-60s. From retirement until death, an individual spends and "dissaves" accumulated wealth, particularly retirement savings and investments. *Dissaving* means that one spends more than one earns, as one lives on retirement savings and investment income.

A criticism or complication of the life cycle hypothesis is that it fails to account for inheritances and bequests as part of an individual's financial life cycle. Households place value on consuming a portion of their accumulated wealth while alive, bequeathing the remainder upon death. In addition to final expenses, the settlement of the deceased's estate, in the absence of a will, is estimated to cost 4% of assets. Survivors and beneficiaries must consider additional costs of inheritance taxes.

Other Death Benefits Programs and Post-Death Arrangements

In addition to savings and life insurance assets, employer accidental death benefits and government and welfare benefits provide financial resources to absorb some of the economic impact of death. In the United States, Social Security taxes paid by workers provide death and survivor benefits to primary beneficiaries after the worker's death through Old Age, Disability or Survivors Insurance (OADSI or OASI). Death benefits are given as monthly annuity payments or as a lump-sum death payment to surviving spouses and children under the age of 18, or up to age 22 if those children are students. Lump-sum payments from OASI benefits can also be sent directly to funeral homes for funeral expenses. Supplemental Security Income is available to those who do not qualify for OASI benefits or have a small amount of OASI

benefits. Surviving parents, relatives, or kinship caregivers may apply for financial hardship benefits to support qualifying children of the deceased through the Temporary Assistance for Needy Families program.

Most developed and increasing numbers of developing countries have similar welfare models as well as employer-sponsored accidental death benefits. In collective societies, particularly in developing countries, family and community groups contribute to burial expenses. In some African traditions, clothing and other material property not protected by a will or probate system are gathered and distributed to survivors by elder relatives. Traditionally, surviving dependents are adopted by extended families or the community, and a surviving wife may be "inherited" by the deceased's surviving male relative chosen by elders as fit to provide for her and any surviving children. Most widows accept this arrangement as a way to keep their children and property.

It is more common nowadays to prepay funeral expenses by purchasing burial or funeral insurance policies or guaranteed pre-need arrangements, thus locking in today's funeral prices. Burial societies are common too, particularly in developing countries. These are nonprofit social organizations to which members pay voluntary contributions for the payment of funeral expenses upon their death or the death of a family member. This preparation for death, just like life insurance planning, helps eliminate the financial stress of surviving family members.

Conclusion

The economic impact of death varies with family structure and the economic circumstances of survivors: whether or not the deceased was an income provider, if the deceased had life insurance, and what the ages are of the deceased and the surviving family. Life insurance planning may mitigate income loss, the burden of final expenses, and the long and difficult readjustment periods for younger families and hence help prepare families for the premature death of an income provider, but the U.S. Survey of Consumer Finances showed only a modest impact of life insurance on survivors' financial vulnerability. The diminished living standard after the death of a loved one is more significant for uninsured surviving women than it is for uninsured surviving men. Further, the data revealed that the financial vulnerabilities of the uninsured were widespread across the whole life cycle, that is, for all age groups of survivors.

Older families do not need to purchase life insurance to prepare for the economic impact of death. They are adequately prepared for the final expenses and living expenses after the death of a deceased provider if they have accumulated reserves in retirement plans, pensions, savings, and investments, according to the ideal financial life cycle. In addition, older families typically would not be supporting dependents and would have paid down significant debt burdens.

Egyptian Perceptions of Death in Antiquity

The Giza Pyramids, the only remaining example of the Seven Wonders of the Ancient World, are massive tombs that demonstrate the emphasis placed on death and the afterlife by the ancient

Egyptians. Life in ancient Egypt was, as noted by Thomas Hobbes, "brutish and short." The ancient Egyptian beliefs regarding death are complex. The focus was not on the end of life but on the cycle of life, which encompassed such issues as sex, fertility, death, and rebirth, and potentially immortality. But the ancient Egyptians prepared in life for a more pleasant existence in the afterlife, an afterlife that promised an easier existence than that experienced while living.

Because of the burial practices in Predynastic Egypt (c. 5500–3100 B.C.E.), such as funerary goods, it is assumed the ancient Egyptians held a complex set of beliefs regarding the afterlife. Given the typical items found in these early graves, it is clear the Egyptians believed one would need these items in the afterlife.

During the Predynastic era, Egyptian bodies were buried in the fetal position; this practice implies a belief in rebirth after death. The scarab beetle (aka the dung beetle), which hatches in a ball composed of mud and dung, appears throughout ancient Egyptian literature as a theme that links notions of death and rebirth. This link with life, death, fertility, and rebirth are common features throughout Egyptian practices. Some funerary texts dating from the Middle Kingdom (c. 2030–1650 B.C.E.) describe the *ba* (the living, immortal divine soul) of the dead man engaging in sexual activity with goddesses and mortal women.

The practice of mummification is thought to have developed after bodies that had previously been buried in the desert emerged in a preserved state. Discovery of these preserved bodies may have aided the ancient Egyptians in developing the concept that the dead continued to live and that the physical body was needed to maintain existence in the afterlife.

To ensure this continued existence, statues of the deceased were often interred with the person's body. Another method to ensure existence after death was via the name, or *ren*, of the deceased person. In instances when it was thought an individual had betrayed the interests of Egypt, that individual's name was physically destroyed by eliminating appropriate writings and inscriptions, along with the destruction of that person's physical body and images thereof. One such example of an attempt to thwart an existence in the afterlife is that of Akhenaten (c. 1349–1336 B.C.E.), a pharaoh who ruled during the Eighteenth Dynasty (c. 1550–1295 B.C.E.). Akhenaten was unsuccessful in attempting to replace ancient Egyptian religion with monotheism. In this instance at least the attempt was not totally successful given that some information remains.

Related to the concept of the afterlife are the *ka*, *ba*, and *akh*. The ka is commonly translated "spirit," like a spiritual doppelganger; ba is thought to be associated with one's personality of moral qualities akin to a soul; akh is held as the successful reunion, at death, of a person's ka and ba, somewhat like a shadow. If a person's ka and ba were not reunited and akh failed to develop, then everlasting life would not occur. In essence that person would be condemned to eternal death.

In the ancient Egyptian religion, the opposite of paradise or Hatep (meaning offerings) was not hell or misery but rather the absence of existence. In addition to ka, ba, and akh, two additional elements required for one to be remembered and protected after death were a person's name and shadow.

Ancient Egyptians believed they would experience judgment upon their death in a ceremony known as Weighing of the Heart. The ceremony was thought to occur in the presence of Osiris, the chief god of the dead. The deceased was required to name each of the deities present and to swear in oath that none of the long list of offenses described had been committed during his or her lifetime. Along with professing their innocence was the ritual of placing the deceased's heart on a scale opposed by a feather which symbolized *ma'at*, the ancient Egyptian concept of truth and justice. If the heart balanced against the feather, the procession was permitted to continue. If the deceased's heart was heavier than the feather (believed to occur because of that person's lifetime transgressions), the heart would sink on the scale and be devoured by "the gobbler" Ammit, an animal with the head of a crocodile, the torso of a lion, and the hind end of a hippopotamus.

The heart was held to be the focus of thought and emotion and was, therefore, considered the most important organ. Given its critical role in one's existence, the heart was not separated from the body during the process of mummification. However, the brain was not considered to be valuable, and thus it served as packing for the head. During mummification, the brain was removed and discarded.

Ancient Egyptians believed that writings and illustrations held magical properties. The Book of the Dead, a collection of approximately 200 magical spells, offers a roadmap into the afterworld. Those individuals able to afford to do so included various parts of the Book of the Dead among the burial artifacts. One example of a more popular spell prominent in a person's burial is chapter 125, which outlines and portrays the Weighing of the Heart as having a favorable outcome for the deceased. Even though some of the spells would nearly ensure successful passage into the afterlife, the Book of the Dead sections were expensive, so most common Egyptians could not afford to make such as purchase.

Mummification

The preservation of the body was considered as being vital for continuation of existence in the ancient Egyptian afterlife. Even though many analysts believe that the first mummies were naturally occurring, it is clear that steps were taken at a later time to improve bodily preservation. The oldest Egyptian example of human attempts regarding bodily preservation dates from the Fourth Dynasty (c. 2575–2551 B.C.E.) with Queen Hetepheres, the mother of the pharaoh Khufu, who is thought to be the builder of the Great Pyramid. Some of her internal organs were removed, embalmed, and buried separately from her body.

Variations in mummification practices are noted throughout the period of ancient history including examples such as the use of blue beads to cover mummies from about the Twenty-Fifth Dynasty onward. But the basic procedure for mummification remains unchanged.

The entire mummification process took 70 days. First, the deceased's body was purified; usually this occurred along the west bank of the Nile because of properties associated with the Nile River. The body was washed in a salt solution mixture known as natron, which aided in the dehydration process vital in mummification. The embalming process included removing the internal organs, which were individually embalmed and placed into Canopic jars. From the Twenty-First Dynasty onward, these organs were then placed back into or around the body. The body was stuffed with temporary packing material and covered with natron for a period of 40 days, after which the body was uncovered, the stuffing was removed, the deceased's body was rinsed inside and out, dried, and repacked with linen, resin, natron, and other materials. In the Late Period (712–332 B.C.E.), bodies were often completely filled with resin. The body was rubbed with a variety of substances—such as natron, beeswax, wine, and spices—and cosmetics and other aesthetical effects, such as rouge, were applied to the body. Amulets to provide protection were placed in various locations on the body. A coating of resin was then covered over the body to further enhance preservation. At this point, the 15-day process of bandaging was begun.

The bandaging with 450 square yards of linen was a common practice. The process included rituals, such as spells, recited by priests and placing jewelry items in the separate layers. A bandaged body was covered in one or more shrouds and placed in one or more containers. The type, elaborate nature, and quantity of the containers varied depending upon the wealth of the deceased. In the case of royal individuals, mummies were usually placed in gold coffins.

Funerals

Funeral scenes were a common feature of paintings found in the tombs of ancient Egyptians. Expensive funerals and the extent of the lavish nature of these funerals depended on the status and wealth of the deceased. The mummy was placed in a shrine-like configuration and surrounded by bouquets of flowers. For the procession of the body from the embalmer to the tomb, the body, encased in a shrine-like container, was placed on a boat-shaped bier and onto a sled. The Canopic jars holding the deceased's internal organs followed behind the body. Priests walked in front of the body performing rituals such as the burning of incense, while food and other items accompanied the body during the procession. Mourners were viewed as a critical part of the funeral ritual, and if enough funds were available, professional female mourners, who tore their hair, cried, rubbed themselves with dirt, and ripped their clothes, were hired.

Dancers represent another common feature of the funeral procession. Women had a prominent role to play in mourning; men, on the other hand, were more reserved.

Priestly rituals performed during the funeral, such as the "opening of the mouth," were included to ensure the body contained the ka during the afterlife. Ceremonies also had to be performed on any statues of the deceased so that they could serve as vessels for the ka if needed. After the burial, guests would partake of a feast.

Most ancient Egyptians were buried in underground graves and raised platforms. Burial site security was of concern given the importance placed on the preservation of the body. Elaborate tombs, such as the Great Pyramids, are a sign of the importance placed on the cycle of life; these also serve as a signal to where great wealth is housed. The vast majority of elaborate tombs were ransacked long before Egyptologists began cataloging their contents. One of the most famous Egyptian discoveries, the tomb of Tutankhamen ("King Tut"), held one on the largest caches of goods found in modern times. The lack of external ostentation of the tomb hid the fact a tomb was present. It is ironic then that the desire to display one's wealth, in essence, ensured that that wealth would be removed and, in fact, would lead to the destruction of the body, which was thought to be vital for continued existence.

In conclusion, death was a central focus of Egyptian culture. Within ancient Egypt, death was viewed not as the end of life but as part of the life cycle. Many aspects of Egyptian culture, such as religion and commerce, paid considerable attention to death, grieving, and the afterlife, all of which seem quite different in comparison to modern practices. Other elements, however, such as partaking of a feast after burial, are quite similar to what is common in modern times.

Elegy

Elegy refers to a particular pattern of poetry that addresses topics such as love, longing, and mourning; more often, elegy encompasses a variety of formats that address death and dying. The death-related elegy is the lyrical approach to loss and grief. Sorrowful lamentation, idealization of the deceased, and provision of solace are among the elegy's identifying traits. Though they vary across cultures and eras, elegies commonly convey mourners' melancholic emotions, memories, and struggles to grasp meaning from the demise of their beloved. They may be written for and about the dead, on the nature of death and life, or in anticipation of one's own expiration. Though elegies promote knowledge about the life and character of a particular decedent, they also assure that bereavement is a common and survivable human experience. They range in tone from visions of bright and glorious afterlife for the deceased to gruesome description of a body during or after death.

This entry examines the origins and use of elegy over time. Notable poets who have produced elegies include John Milton, John Donne, Alfred Tennyson, Thomas Hardy, Ralph Waldo Emerson, Walt Whitman, Dylan Thomas, and W. H. Auden. The tradition of elegy is self-referential in that elements developed by ancient-era elegists have been invoked by their successors.

Origins of Elegy

In ancient Greek civilization, several centuries B.C.E., one rhythm or meter of poetry was the elegiac distich. It was a constraint of format rather than topic, as elegies tended to focus on intense subjects, such as politics, love, and loss. Poets, including Callinus, Tyrtaeus, and Archilochus, wrote song-like elegies to be accompanied by

musical instruments. Antimachus's "Lyde" was a collection of elegies written to assist the poet's recovery from the loss of his wife. Theocritus's idylls, featuring nature, deceased and grieving shepherds, and the shepherds' protective nymphs, were harbingers of the later English tradition of pastoral elegy. Roman/Latin elegists, including Ennius, Gallus, Propertius, and Ovid, devoted their efforts to love and eroticism.

During a pre-Islamic period starting in the 6th century C.E., an Arabic elegiac tradition arose; tearful weeping at graveside, participation in grief by the entire universe, and the incontrovertible role in death of Dahr, a fateful destiny, were all prominent. Females were believed to be especially emotional and advantaged as elegists. One praised example was al-Khansa, a contemporary of the Islamic prophet Mohammed, who wrote about her brother Sakhr's passing for the rest of her life. In the Muslim Spain of the 10th century, Hebrew poets such as Solomon ibn Gabriol and Moses ibn Ezra were encouraged to contribute to cultural tradition and did so in elegies that heavily echoed Arabic motifs.

European Elegy

The Middle Ages offered many elegies for royals that included contact with the dead and prophetic dreams. For instance, Geoffrey Chaucer's "The Book of the Duchess" probably honored the wife of John of Gaunt and portrayed a poet's dream of a hunt interrupted by a darkly clad grieving knight.

Only two 16th-century French poets received any acclaim for their elegies, the majority of which were not about death or grieving. Clement Marot's "Suite de l'Adolescence Clementine" included both love epistles and the "Complaintes," which lamented the passing of contemporaries. Marot may be best known for invoking tragic catastrophe, such as the burning of one elegy subject's bed and the drowning of another by river gods envious of his talent. Charles Fontaine also wrote many love elegies but later integrated a few examples of mourning in "Les Ruisseax de Fontaine." German poets of this era also produced elegy that rarely addressed death and loss.

Many great English poets of the 16th through 19th centuries contributed to the elegy canon. Whereas Thomas Churchyard ruminated on the dreary aspects of burial and bodily decay after death, Nicholas Grimald, Barnabe Googe, and Ben Jonson detailed characteristics of, and personal connections with, the deceased. Jonson also eschewed what he considered to be disingenuous displays of emotion. Edmund Spenser's "Astrophel" emphasized passage into an eternal state and the union of romantic partners in an afterlife while John Donne's "A Funeral Elegy" section of his "An Anatomy of the World: The First Anniversary" also exhibited great concern for the soul of the deceased.

Spenser's "The Shepheardes Calender" was a return to the pastoral sensibility of the ancient Greeks. The unifying components of pastoral elegy include simple address, dead contemporaries represented as shepherds and mourned as friends, mythological entities such as nymphs and muses, and bucolic locales that correspond to the natural acceptance of spiritual resurrection and afterlife. Milton's "Lycidas" mourned his fellow poet and minister in training, Edward King, as a shepherd lost to his flock of sheep. A majestic bitter emotion sweeps through his otherwise serene world as does a "blind Fury with th' abhorred shears." In Thomas Gray's pastoral "Elegy Written in a Country Churchyard," the narrator passes a graveyard, reflects on the likely humble status of its inhabitants, and resolves that emphasis on grandeur and glory in life is misplaced. Natural phenomena, such as moping owls, droning beetles, and morning breezes, abound in its 32 stanzas. Percy Bysse Shelley's "Adonais" portrays the English Romantic poet, John Keats, as the Greek vegetation god, Adonis, and is set among dewy flowers, fresh leaves, and moss.

The close of the 19th century found English poets considering the role of destiny in death. Tennyson, poet laureate of the United Kingdom, cajoled into creating a poem of thanksgiving for his own recovery from serious illness while at sea, instead produced an elegy for himself. In "Crossing the Bar," the barrier separating one from the sea of death is navigated by the pilot, who determines all outcomes. Hardy, writing often on the loss of his wife but also about suicides, wartime, and accidental deaths, seemed conflicted on whether a god or some unknowable force was responsible for evil and loss. Hardy's removed detachment marks his elegiac efforts such as "Drummer Hodge," in

which the deceased resides only in a small mound rather than among the constellations of stars above. Wilfred Owen, an eventual battle casualty himself, railed against the inevitable elimination of a generation of young European men in World War I. His war elegies, "Anthem for Doomed Youth" and "Dulce et Decorum Est," questioned the feasibility of adequate consolation for gassed, bootless soldiers whose "blood come gargling from the froth-corrupted lungs."

American Elegy

The course for elegy in the New World was initially set by the Puritan sensibility. An early New England tradition was to attach elegies to coffins; thus, only a fraction survived to become a type of family heirloom. As in Europe, the Puritan elegy was, to some extent, a self-reference. For instance, Cotton Mather's elegy for Urian Oakes, a top administrator at Harvard University, named other local elites who had created, or had been subjects of, elegy. By the 1730s, as Puritan practices of dour lamentation and longing for heaven faded somewhat from social life, Puritan elegy was ostracized. Nonetheless, the elegy satire tradition, practiced by noteworthy writers such as Benjamin Franklin and Mark Twain, has never extinguished the American passion to elegize.

One prominent and prolific producer of elegy in colonial America was Annis Boudinot Stockton, who wrote dozens of elegies in the latter half of the 18th century, including several for her husband, female friends, and celebrities such as Benjamin Franklin. Often adopting the pastoral elements, Stockton also utilized dialogue and explored issues such as the burdens of grief on friendship. Early 19th-century American elegists reinforced the honoring of the dead, history, and tradition. For instance, William Cullen Bryant's famed "Thanatopsis" revisited the English practice of graveside meditation while reminding readers that the dead actually exist to both haunt and guide the living.

Antebellum America fervently produced elegies to remember the children who did not live long enough to make history. Lydia Huntley Sigourney was such a renowned specialist in the child elegy that she was barraged with requests for customized exemplars. Alternatively, Transcendentalist writer Emerson was besieged by the deaths of his own wife and two brothers shortly before that of his 5-year-old, Waldo. In his elegies "Nature" and "Experience," he numbly ponders his losses and a grief that he somehow detaches from without scars.

Concurrently, African Americans expressed their enslaved status, culture, and resistance in song and literature; the elegiac form was no exception. Though Phyllis Wheatley's acclaimed elegies of the previous century were for whites, such as the English preacher George Whitefield, George Moses Horton was a Southern slave poet who published just as many elegies in the mid-1800s. Elegies for slaves were also key pieces of propaganda by abolitionists, such as Sarah Louisa Forten, as well as honest expressions of mourning for the dead and their difficult lives.

A great elegy was crafted by a renowned American poet upon the assassination of President Abraham Lincoln. Though Whitman's "When Lilacs Last in the Dooryard Bloom'd" is pastoral in tone and even portrays Lincoln as the shepherd to the nation, it also portends a shift toward symbolic and political remembrance of public figures. Nature emerges only in the end as apart from the grief and death of wartime. With his description of nameless wasted soldiers as debris of the Civil War, Whitman ushered in the modern elegiac response to calamitous and abundant fatality by way of war, genocide, and terrorism.

Born on the edge of the 20th century, a generation of poets began to shift from modes of comforting solace to accounts of incontrovertible loss, inconsolability, and unfulfilled quests for understanding. Thomas's "Do Not Go Gentle Into That Good Night" famously exhorts his dying father to "rage, rage against the dying of the light." Langston Hughes was an African American poet whose incorporation of musical blues themes into his poetry produced a mourning of social injustice and racial inequity rather than elegies for individuals. Auden, a noted writer of sonnets and love poems, strongly identified with the subjects of his elegies, even echoing their own characteristics in his form. He challenged Yeats, mocked the "unknown citizen" consumer of modern life, and even analyzed Sigmund Freud posthumously.

Passage into personal and psychological realms has marked elegy of the past half century. Beat

poet Allen Ginsberg mixed homosexual and scatological imagery with references to his mother's repulsive physical appearance and to the Kaddish in his elegy for her. Poet and novelist Sylvia Plath multiply elegized her menacing father, who also figured prominently in the journals that were released after her suicide. In elegizing both celebrities and the lesser known, New York school poet Frank O'Hara countered grief with vivid accounts of random contextual details. Adrienne Rich, a noted voice in poetry for the lesbian and feminist movements, purposefully avoided the suicide of her husband in elegies, choosing instead to honor the work and lives of women who might otherwise have been forgotten.

In light of these varieties of elegy, one thing appears certain. As it always has, elegy in the 21st century is likely to adopt new shapes while preserving, adapting, and discarding the various characteristics of its predecessors.

Embalming

Embalming is the use of a chemical process to provide short- or long-term preservation of a dead body. Modern embalming removes blood and gas from a body and typically the contents of its internal organs, and then treats the body with chemicals. The process and the preservatives used have changed considerably since its first practice by the ancient Egyptians. The reasons behind the process have varied from the religious and scientific to the hygienic and the psychological. Today, embalming is used mainly in North America (and to a limited extent in Great Britain and Australia) to provide short-term preservation of a corpse for viewing, typically within a week of death. Embalming continues to be used throughout the world to preserve cadavers for medical research. Though embalming is the norm and even considered traditional by the North American general public, the practice is not without its critics.

History

The history of embalming can be divided into three periods: the ancient Egyptian era, the period from the Middle Ages to the U.S. Civil War, and the current era, which began during the U.S. Civil War and continues to the present. Each period reflects different purposes and techniques. Some call the process before the use of arterial injection into the circulation system, embalmment. Embalmment involved evisceration, the removal of internal organs, packing the cavity with chemicals, and allowing the body to dry out. The development of arterial injection in the late 17th century marked a significant change in the process.

The ancient Egyptians started embalming during the First Dynasty (3200 B.C.E.) and continued the practice for 4,000 years. The purpose was religious: to preserve the body for reincarnation. The process usually included evisceration. The internal organs were preserved separately. The body was chemically treated in a lengthy process including a sodium salt bath. Treatment of the deceased had variations based on social rank and dynasty.

Embalming during the Middle Ages through the U.S. Civil War was mainly to preserve the bodies of important individuals or to preserve cadavers

for medical research. During this period, embalming shifted from the embalmment process using evisceration to arterial embalming, thanks to advancements in medical knowledge. Arterial embalming used a vast array of chemicals, such as oil of turpentine and camphorated spirits of wine in the late 1600s and then bichloride of mercury, zinc chloride, heavy metal salts, and arsenic compounds by the mid-1800s. The injection of chemicals would eventually make evisceration a rarer occurrence for the preservation of cadavers. As arterial injection embalming became more widely used in the 1700s, barber-surgeons were its main practitioners as they preserved cadavers for medical and scientific study.

Embalming bodies for the purpose of short-term preservation before burial received its first public notice during the U.S. Civil War and the embalming of President Lincoln and his son Willy before him. Embalming surgeons, such as Thomas Holmes and Richard Burr, embalmed thousands of soldiers during the war using gravity fluid injectors to inject their solutions. At this time, undertakers did not embalm but provided coffins and other services. After the war, embalming was not performed to a great extent in the United States until a number of inventions became widespread, undertakers became organized in associations, and embalming training spread.

In the late 1800s, if bodies were to be preserved, they were typically put on ice and/or wiped down by undertakers with disinfectants and preservatives. Important inventions helped change American funeral customs, including the discovery of formaldehyde as a preservative in the late 1880s. A 4% formaldehyde solution was developed in the 1890s and would hold up as the favorite solution for over a century, replacing the more toxic chemicals containing mercury and arsenic. The trocar for cavity aspiration was patented in 1878. When perfected, the trocar would make evisceration unnecessary. In the late 1800s cavity and arterial embalmers competed over which practice produced superior results. Eventually undertakers typically did both processes.

For embalming to spread, training and organization of the funeral industry was needed. The National Funeral Directors Association was established in 1882. Shortly before that, two funeral industry publications, *The Casket* (1876) and *The Sunnyside* (1871), were established. An embalming text, *The Undertaker's Manual,* was developed by Auguste Renouard in 1878. Finally many embalming schools were established in the 1880s. The first, in Cincinnati, was established in 1882. The modern funeral industry now had its footing as it worked to become an established profession.

The mass manufacturing of funeral products would occur in this same period. Dodge Chemical Company, the Champion Company, and Frigid Fluid Company, makers of embalming fluids, were founded in the decades after the Civil War. These companies were deeply involved in the development of the funeral industry. For example, the Dodge family founded and ran the Massachusetts College of Embalming, now part of Mount Ida College. Other funeral products, such as caskets, embalming tools, cooling boards, and hearses, would also be mass produced by 1900 to support the growth of the industry.

Embalming was done in the home of deceased as the funeral business started to apply the practice to the general public in the 1890s. Using the gravity fluid injector and a cooling board, the undertaker embalmed in the parlor or other room of the home. The body would be displayed in the parlor, for those who had one. The transition from home to funeral home for embalming and body display is not well documented. The typical explanation for this transition is that crowded tenements, smaller homes, and isolated families led to the need for the use of the funeral home.

Purpose

The purposes of embalming are contentious. Born out of the sanitation era of the 1880s, the funeral industry has typically said the main purpose of embalming is for disinfection and to protect public health. The funeral industry seems to be the only source still claiming embalming serves a public health function. Funeral industry critics such as Jessica Mitford and the Funeral Consumer Alliance claim the use of formaldehyde and other chemicals make the process more of a public health hazard than leaving the bodies to deteriorate naturally. In the United States, the Occupational Safety and Health Administration has set up numerous regulations regarding embalming and chemicals that are considered a danger to embalmers. Less toxic

alternatives to formaldehyde have been introduced into the field, including ethyl alcohol and polyethylene glycol, glutaraldehyde, and phenoxyethanol. But none of these seems to produce the favored effects of formaldehyde.

The other purpose of embalming, according to the funeral industry, is to slow decomposition to facilitate the creation of a "Beautiful Memory Picture," a concept coined by the funeral industry. Embalming provides the basis for the restoration of the body, to not only make it lifelike but to attempt to return the body back to the way the person looked before long- or short-term trauma took its toll. By introducing coloring, hydrating tissues, setting features, makeup, and possible reconstruction, the dead look asleep. This illusion is reinforced by an upholstered bed (casket) with a pillow and a mattress. This presentation has obviously become an expectation of the North American funeral ritual. Whether such a presentation of a body is needed to help facilitate the grief process is highly debated by critics of the practice. Many claim it feeds the denial of death that is prevalent in North American society.

The Process

The modern embalming process typically uses four processes: arterial, cavity, hypodermic, and surface embalming, as well as the setting of the mouth, the use of eyecaps, and shaving.

Arterial Embalming

Arterial embalming involves injecting chemicals (including preservatives and tint) into the circulation system, usually via the right carotid artery. A small incision is made just deep enough to cut the skin, and an aneurysm hook is used to raise the artery and vein. The artery is cut into and a tube is inserted. Blood is displaced from the right jugular vein. A clear hose is attached to the drain tube, and the hose from the embalming machine is connected to the arterial tube. The embalming machine has two knobs, which regulate pressure (the force of the fluid) and rate of flow (speed of the fluid). These knobs are adjusted to create the best rate of injection for the body. The 3 to 4 gallons (1 gallon per 50 pounds of the body) of embalming solution is injected while the embalmer massages (and perhaps washes) the corpse to ensure a proper distribution of the embalming fluid. In cases of severe injury, autopsy, or poor circulation, other injection points may need to be used. The jugular drain tube is opened periodically to allow blood to escape and prevent too much pressure from building in the vascular system. The blood drains directly into the sewer system.

A tint is also introduced into the body to simulate the presence of blood in the system. There are other fluids to break up clots, to restore dehydrated tissues, or to reduce fluid in tissues. The embalmer can choose from many concentrations of formaldehyde, depending on the condition of the body and amount of firmness the embalmer desires. The embalmer is able to gauge whether the body is fully embalmed by whether the tint has spread throughout the body, by the firmness of tissues from the solution, or by the flow of embalming solution from the jugular tube. The body needs to be positioned with embalming, because the solution stiffens the body into a permanent rigor mortis. Tubes are removed, veins and arteries are tied off, and the suture is sealed. The other steps in the embalming process tend to be less known to the public, especially the use of the trocar.

Cavity Embalming

In cavity embalming, the trocar punctures the skin just above the navel and is then pushed into the chest and stomach cavities to puncture the internal organs and aspirate their contents. A trocar is a long metal tube with a sharp point at one end with little holes to suck in material and gases. It is connected to a hose that is attached to a device that creates suction. The cavity is filled with preservative chemicals similar to the embalming solution. The hole made by the trocar is either sutured closed, or a trocar button is screwed into place.

Hypodermic and Surface Embalming

In hypodermic embalming, chemicals are injected under the skin as needed in areas the arterial embalming did not reach. Surface embalming is used to supplement the other methods, especially for visible, injured body parts. This is when an embalmer may "fill the features," building up

tissue to remove wrinkles, filling in lips, and building up other visible dehydrated areas like earlobes, fingertips, and the cheeks.

Facial hair of men, women, and children is shaved as part of the embalming process to avoid conflict with the cosmetics. Eyecaps can be placed under the eyelids. The eyes sink with dehydration and the burrs on the caps keep the eyes closed (or a form of Super Glue can be used to keep eyes closed). The jaws and lips also have to undergo distinct procedures. The jaw is typically permanently closed by passing a wire through the upper and lower gums and twisting the wires together. The position of the mouth, cheeks, and lips seem to be of particular concern to the embalmer. A mouth-forming device of metal or plastic can be placed behind the lips and lips and sealed with glue or straight pins. Various techniques are used to bring a "healthy" appearance to the mouth area and just the right expression.

End-of-Life Decision Making

Several landmark court cases—The Karen Ann Quinlan case in 1975, the Nancy Cruzan case in 1990, and the Terri Schiavo case in 2005—have brought national attention to the significance and importance of having mechanisms in place for implementing care decisions at the end of life. Due to injuries sustained in an accident or unanticipated health events, these women were unable to make their own health care decisions. Because the women did not have written documents that clearly stated their wishes for sustaining life and their close family members disagreed about the type of care they should receive, decisions made about their end-of-life care resulted from lengthy legal battles. To avoid these undesirable situations and assist persons who wish to remain in control of health care decisions after they are unable to articulate their desires, states have enacted laws that allow for the creation of advance directives to help facilitate end-of-life decision making.

Advance directives are legal documents prepared by a competent individual that convey wishes regarding personal health care decisions. Two types of advance directives are the living will and durable power of attorney for health care. A living will enables individuals to express their wishes regarding life-sustaining treatment, such as the use of a feeding tube or ventilator for pulmonary failure. Narrow in scope, a living will authorizes the use or withdrawal of certain life-sustaining procedures only in situations in which individuals are mentally incapacitated and death from a terminal condition is imminent or if they are in a persistent vegetative state. Conversely, durable powers of attorney for health care are not restricted to terminal illnesses or prospectively identified situations. Instead, they give a broader range of authority to a trusted individual (i.e., surrogate) to make health care decisions only when the individual cannot make the decisions. Although any adult can initiate advance directives, the Patient Self-Determination Act, passed by U.S. Congress in 1990, requires that all federally funded hospitals and nursing homes give patients an opportunity to complete a living will and durable power of attorney for health care upon admission.

The driving force behind advance directive laws is the ethical principle of autonomy, which requires respect for persons' deliberate choices made in accordance with their own values, consciences, and religious convictions. By appointing a surrogate decision maker, the individual attempts to extend the principle of autonomy into situations of personal incompetence. The surrogate decision

maker is usually a family member who has sufficient knowledge of the person's values and desires to make the appropriate decisions. Executing advanced directives requires surrogate decision makers to adhere to the ethical principle of substituted judgment, wherein they are to replicate the same decision the person would have made had she or he been capable of making a decision. This standard requires that surrogate decision makers synthesize the person's diverse values, beliefs, practices, and prior statements to reconstruct what she or he would want under the specific circumstances. Surrogates have an implicit duty to follow the individual's presumed instructions by attempting to carry out those reported desires.

When the desires of the individual are not clear or the individual's preferences place him or her at undue risk, surrogates may use a current or best interests approach to assess whether treatment will advance the current and future welfare of the person. Surrogates determine whether the person's life is so diminished that he or she should have no further treatment, rather than if the person would choose continued treatment. Choices made using this approach may or may not be the same as the person's preferred decision, if known. Typically in these situations, physicians' judgments and recommendations regarding what is in the person's best medical interests are strongly considered. The differences between what is in the person's best medical interest and what is most beneficial to the individual, that is, in the person's best interest, often become blurred, with the best medical interest, "do no harm," winning out. Therefore, the best interest standard generally leans toward preserving life.

Less than one fourth of all American adults have advance directives documents in place. Most people tend to believe family members will know what to do if they face making such decisions. Older adults often want their families and physicians to make decisions on their behalf conjointly because they believed physicians' substantive knowledge combined with family members' concern for their well-being produces more accurate and effective decisions. However, without specific communications, persons cannot assume that their family members or physicians have sufficient knowledge of their preferences for end-of-life care. Even when individuals discuss their end-of-life care with family members or other surrogates, they often do not address specific life support preferences or treatments. Researchers frequently report poor agreement between what individuals say about the care they would choose for themselves in critical care situations and what their family or other surrogate decision makers would choose for them.

Health care providers often promote the use of a values inventory to encourage family discussions about end-of-life care. Completing such instruments provides an opportunity to share information with surrogate decision makers that will help them understand the person better. Such discussions are vital to guiding decision making, when future, unanticipated medical conditions prevail, and to ensuring the quality of care provided.

Epidemics and Plagues

Epidemiology is the study of the distribution of diseases in populations and of factors influencing the occurrence of disease. Epidemiologists study both epidemic (excess) and endemic (always present) diseases. The basis of epidemiological science rests on the premise that disease does not occur by chance but rather that a range of environmental

and personal characteristics that vary within populations influence disease occurrence. Epidemiological studies, which include those seeking to explain the transmission of communicable diseases by determining commonalities among those who become ill, are an important basis for public health interventions and policies. In recent decades, epidemiologic studies have focused on a fuller understanding of factors influencing chronic conditions (e.g., diabetes, heart disease, and cancer) that are prevalent in developed countries. Studies of these factors have been successful in identifying personal characteristics and environmental exposures that increase the risk of disease, thereby contributing to preventative measures and public policy.

Epidemics

An epidemic may be defined as the temporary increase of cases of disease in a geographically defined area in excess of what is usually expected on the basis of recent experience. The general public associates epidemics with infectious diseases (also called "contagious" or "communicable" diseases) that are caused by pathogens (disease-causing organisms), which include bacteria, viruses, fungi, protozoa, parasites, and prions. The term *epidemic* derives from the Greek terms *epi* (upon) and *demos* (people). Because an epidemic depends on the "usually expected" number of cases of a disease within a population, even one case of a very rare or unexpected disease (e.g., smallpox) may represent an epidemic whereas many cases of a disease (e.g., malaria) would be classified as endemic rather than epidemic.

Other terms often associated with epidemic include *outbreak, cluster*, and *pandemic*. A cluster is a grouping (or aggregation) of cases of a disease or other health-related events or conditions that are related by time and place. *Outbreak* is a term used to describe a large number of cases of disease in a short period of time among a localized group of people. Clusters of sufficient size and importance may be considered outbreaks. A pandemic is an epidemic that is widespread and affects a whole region, a continent, or the world (e.g., AIDS). Other terms often found in epidemiological reports are *prevalence*, *incidence*, and *rate*. Prevalence is the number of diseased individuals (cases) at any one time (point prevalence) or over a given period (period prevalence). Incidence refers to the number of new cases of a disease, injury, or other condition that occur within a defined population over a given period of time. Rate may be thought of as the number of cases in a fixed number of people, for example, cases per 100,000.

Epidemics are caused by a common source of infection, such as food or water. Common-source epidemics can cause illness in large numbers of persons. Examples of common-source epidemics include botulism (from soil-contaminated food), cholera (from fecal-contaminated food and water), typhoid fever (from fecal-contaminated food and water), and brucellosis (from milk or meat of animals infected with *Brucella* spp.). Host-to-host infections, on the other hand, are transmitted from one infected individual to another through direct contact or through a carrier. Examples of host-to-host epidemics include tuberculosis (from inhalation of airborne particles), measles (from human sources), and hantavirus pulmonary syndrome (from inhaled fecal material of carrier rodents). Host-to-host epidemics tend to grow and to abate more slowly than common-source epidemics, because the latter type of epidemic generally stops once the source of infection has been identified and removed.

Disease-causing organisms are transmitted through several main routes of entry: skin, respiratory tract, gastrointestinal tract, genitourinary tract, and conjunctiva (eyes). Coughing, sharing contaminated needles, and sexual intercourse are activities that hold the potential to spread pathogens from one person to another. Whether an individual who has been exposed to a pathogen develops an infection depends upon several host factors, including age, metabolic state, immune status, and genetic factors. An infected person, especially one infected with a virus, may not develop disease or may have only a mild case of disease; however, an infected person, without apparent disease, may transmit the infection to other persons.

In recent years, epidemics of infectious diseases have captured worldwide attention because of the potential in modern society for rapid spread of infectious diseases from one part of the world to another; the potential use of pathogenic microorganisms as weapons; fear and panic regarding the

lethality of certain organisms; and the means to communicate instantaneously information about emerging and infectious diseases. Epidemics, which appear to come and go unpredictably, can affect large numbers of people. Prior to the advent of effective treatments for many infectious diseases, epidemics frequently killed thousands, even millions, of people. Even today, diseases such as malaria and tuberculosis kill millions of people each year, mainly in resource-poor nations. Although vaccines have been developed to prevent many infectious diseases, these vaccines do not always reach the most vulnerable persons, resulting in the deaths of as many as 2 million people each year from vaccine-preventable diseases. Still other vaccines and drugs are in development to prevent and treat infectious diseases such as tuberculosis and malaria that are endemic in many parts of the world.

The current level of interest in infectious diseases might seem illogical in light of improvements in living standards, the introduction of vaccines and antibiotics, and a worldwide reduction in the number of deaths from infectious diseases. But recent epidemics of HIV/AIDS, West Nile virus, mad cow disease, multidrug-resistant tuberculosis, and swine flu, among many others, highlight the enormous public concern regarding epidemics resulting from infectious organisms. In addition, movies of the "deadly virus at large" genre have fueled public interest in epidemics. Examples of such doomsday movies include *The Seventh Seal* (1957), *Masque of the Red Death* (1964), *The Cassandra Crossing* (1976), *The Carrier* (1987), *The Black Death* (1992), *Outbreak* (1995), and *28 Days Later* (2002).

Modern epidemics are often associated with "emerging and reemerging" infectious diseases. The National Institute of Allergy and Infectious Diseases of the National Institutes of Health has classified emerging diseases as outbreaks of previously unknown diseases or known diseases whose incidence in humans has significantly increased in the past 2 decades (e.g., hepatitis C, Lyme disease, ehrlichiosis). Reemerging diseases are known diseases that have reappeared after a significant decline in incidence (e.g., mumps virus, *Staphylococcus aureus*). Epidemics of emerging and reemerging infectious disease can be attributed to several factors that were reported in the Institute of Medicine's 1992 report *Emerging Infections: Microbial Threats to Health in the United States*. These factors include a complacency regarding emerging infectious diseases; changes in human demographics and behavior; socioeconomic factors, especially poverty; advances in technology and industry; economic development and changes in land use; increased frequency and speed of global travel and commerce; adaptation of microbes; and deterioration in the public health system at all levels. Other factors often cited for epidemics include changes in the mass production of food products (and increased import of food products), climatologic changes and environmental degradation, war and natural disasters, and the deliberate release of microorganisms as an act of war or terror.

The World Health Organization has reported that in the past 3 decades, more than 30 new organisms have been identified worldwide, further underscoring the need for strong political commitment and financial support to ensure coordinated approaches to the prevention and control of infectious diseases around the globe. Reemerging diseases are also an ongoing challenge because human genetic factors allow new strains of known pathogens to appear to which the immune system has not been previously exposed. The National Institute of Allergy and Infectious Diseases further notes that many pathogens have developed resistance to antimicrobial drugs, allowing the resurgence of some formerly treatable diseases. Health care–associated infections, especially methicillin-resistant *Staphylococcus aureus*, serve as other examples of infections that have grown resistant to antimicrobial drug treatment. Failure of children and adults to obtain recommended vaccinations has also contributed to the reemergence of formerly controlled diseases. Finally, many infectious diseases (e.g., polio) have never been adequately controlled in some parts of the world. Some of these diseases, which were previously limited to certain parts of the world, now pose a threat to the U.S. population.

Plague

The term *plague* refers to an infectious disease of humans and animals caused by the bacterium *Yersinia pestis*. Plague is also an ancient term with a biblical heritage that has a broader meaning. In

the book of Exodus, God unleashed 10 plagues on Egypt in an effort to free the Israelite slaves. These plagues included a number of calamities: changing rivers to blood, causing disease in livestock, mixing hail and fire, and causing boils that would not heal. The disease plague, also called "the black plague" or "the black death," caused three recorded pandemics throughout history: the plague of Justinian (541–542 C.E.) killed an estimated 100 million people worldwide; the black death (1347–1351 C.E.) killed an estimated 100 million people in Asia, Europe, and Africa; and the third pandemic (mid- to late 19th century) killed millions of people worldwide. While there are several theories regarding the origin of plague, many historians believe the disease may have originated in China.

Plague is transmitted to human beings from the bite of a rodent flea that carries the plague bacterium or by the victim handling an infected animal. After an infected rat dies, the flea seeks another warm-blooded host, including human beings. Plague may be manifested in three forms: (1) bubonic (lymphatic system) plague (85% of cases), (2) septicemic (bloodstream) plague, and (3) pneumonic (lung) plague. With the most common form of plague (bubonic), the plague bacillus travels from the site of the flea bite to the nearest lymph node (neck, groin, or armpit), where it reproduces and causes the lymph node to swell. Septicemic plague can be caused both from flea bites and from contact with infective materials through breaks in the skin. Pneumonic plague, which results from inhalation of aerosolized droplets of infective bacteria, is the least common but most virulent form of plague. Only pneumonic plague has a high risk of person-to-person transmission.

Effective treatment for plague includes early diagnosis, the early administration of antimicrobial agents, and provision of comfort and supportive measures. *Untreated* plague has a high mortality rate (50% or higher), which drops to 15% with early diagnosis and treatment. In ancient times, persons with plague were subjected to quarantine. It was not until the germ theory of Louis Pasteur was accepted and built upon by such scientists as Joseph Lister and Robert Koch that scientifically based treatment approaches to infections became standard.

In modern times plague remains a threat to human health. Wild rodents in certain areas around the world (e.g., Madagascar, Tanzania, Brazil, Peru, Burma, China, and Vietnam) are infected with plague. In the United States these hosts are mainly ground squirrels, prairie dogs, wood rats, deer mice, chipmunks, and moles. Recent studies indicate a small percentage of human disease is caused by the scratches or bites of infected cats. Most cases of plague in the United States occur in the western third of the country, primarily in northern New Mexico, northern Arizona, southern Colorado, southern Oregon, western Nevada, and California. While only about 10 to 15 isolated cases of plague are reported in the United States each year, the World Health Organization reports 1,000 to 3,000 cases of plague annually. According to the Centers for Disease Control and Prevention, the last urban plague epidemic occurred in Los Angeles in 1924–1925.

A plague vaccine was discontinued by its manufacturers in 1999 and is no longer available. Plans for future licensure and production are unclear. This could become a problem in the future, for even though plague is relatively rare today, bioterrorism experts have raised concerns about the possible use of *Yersinia pestis* in an aerosol attack, which could possibly spread the pneumonic plague. Although creation of such a bioweapon is theoretically possible, bioterrorism experts report that such a weapon would require advanced knowledge and technology. A working group of biodefense experts has determined that *Yersinia pestis* is one of the most serious of "critical biological agents" that could be deployed by terrorists. Their concerns stemmed from the availability of *Yersinia pestis* around the world, the potential capacity for its mass production and aerosol dissemination, difficulty in preventing such activities, the high fatality rate of pneumonic plague, and the potential for secondary spread of cases during an epidemic.

Epidemics Through History: A Brief Overview

Throughout recorded history, epidemics have shaped civilizations. Listed here are some of the more notable epidemics that have affected large numbers of people and about which much has been written by social historians. This listing represents only a fraction of the many regional and

global epidemics throughout recorded history: leprosy in medieval Europe; cholera epidemics in the 19th century; the great plague of London (1665); the Boston smallpox epidemic (1721); influenza pandemic (1781–1782); the yellow fever epidemic in Philadelphia (1793); tuberculosis in Europe and North America (1800–1922); the first cholera pandemics (1817–1824); typhoid fevers in cities (1850–1920); yellow fever in New Orleans (1853); smallpox in Europe (1870–1875); Spanish influenza in North America (1918–1919); syphilis (1494–1923); poliomyelitis in the United States (1916–1950s); tropical diseases during the construction of the Panama Canal (1904–1914); AIDS pandemic (1980s–present); severe acute respiratory syndrome (SARS) outbreak (2003).

In recent times, infectious disease epidemics have created sensational headlines around the globe. Many of these epidemics are caused by emerging and reemerging infectious diseases. A review of topics treated in the online journal *Emerging Infectious Diseases* provides an overview of some of the diseases of greatest concern: avian and swine influenza; West Nile fever/virus; drug-resistant tuberculosis; legionellosis; dengue fever; Ebola, Marburg, and Lassa fevers; Rift Valley fever; tick-borne encephalitis; S ARS; Creutzfeldt-Jakob disease; hantavirus pulmonary syndrome; cryptosporidiosis; HIV/AIDS; drug-resistant pneumococcal pneumonia; *Escherichia coli* 0157:H7 infection; anthrax; *Cyclospora cayetanensis*; measles; and hepatitis. Some of these diseases have caused outbreaks of highly lethal diseases in a relatively small number of countries (e.g., avian influenza), whereas others (e.g., West Nile virus) have been more widely dispersed, although not as lethal. Some of these diseases have "emerged" or "reemerged" because their hosts' immune systems are suppressed or simply because of improvements in recognizing or testing for the diseases.

Tracking and Controlling Epidemics

All nations have systems in place to identify outbreaks of infectious diseases, to conduct investigations, and to institute control measures. Some nations, particularly resource-rich nations, have rapid response systems to investigate outbreaks and quickly implement control measures. In addition, ongoing surveillance of infectious diseases, including the use of early warning systems, are important features of many nations' public health systems. In the United States, the federal Centers for Disease Control and Prevention (CDC), headquartered in Atlanta, Georgia, has a broad mission that includes a mandate to investigate, initiate, and maintain activities to control infectious diseases. The CDC consists of various divisions, including the National Center for Infectious Diseases. The Council of State and Territorial Epidemiologists (CSTE) is a professional association of over 1,050 public health epidemiologists working in states, local health agencies, and territories. The CSTE provides technical advice and assistance to public health agencies such as the CDC. CSTE members have surveillance and epidemiology expertise in a broad range of areas, including infectious diseases.

In 2000, the World Health Organization initiated the Global Outbreak Alert and Response Network (GOARN), which is a technical collaboration of existing institutions and networks that pool human and technical resources for the rapid identification, confirmation, and response to outbreaks of international importance. The GOARN provides an operational framework to link this expertise and skill to keep the international community constantly alert to the threat of outbreaks and ready to respond. Health Canada's Global Public Health Intelligence Network (GPHIN) provides an Internet-based "early warning" system that gathers preliminary reports of public health significance 24 hours a day. The GPHIN multilingual system gathers and disseminates relevant information on disease outbreaks and other public health events by monitoring global media sources such as news wires and websites. Notifications about public health events that may have serious public health consequences are immediately forwarded to users.

While regional collaborations among nations (e.g., South Asian Association for Regional Cooperation) were initially developed to promote economic development, member nations now collaborate around public health issues, including disease outbreak containment. The World Health Organization has identified regional networks of laboratories, scientists, and clinicians that can be mobilized when an outbreak of a serious disease threatens public health. This level of international cooperation is critical to contain disease outbreaks, especially when these outbreaks occur in countries

or regions that do not have the needed infrastructure and resources.

Epitaphs

An epitaph is a short phrase that honors a deceased person, usually inscribed on a tombstone. The English word *epitaph* is derived from the Greek *epitaphios*, which translates literally as on or at (*epi*) the grave (*taphos*). In its verbal form, the word refers to the performance of rituals at a grave and the meaning developed to refer to the text inscribed on a grave marker. Epitaphs that indicate the name of the deceased have their origin in ancient Greece and Rome, but epitaphs that express aphorisms also have an ancient and modern literary tradition.

In ancient Greece, an upright stone slab (*stele*) marked the location of a burial and an inscription on it communicated the identification of the deceased. These two rituals of commemoration were not always combined: With the development of writing, the custom of identifying the deceased originated in Egypt and among the Minoan-Mycenaean civilizations, even though the location of a burial had also been communicated earlier, whether through a tumulus mound, a monument, or a pile of stones, in other regions of Europe, Africa, and Asia. Greek steles and columnar markers (*kioniskoi* or *columellae*) could be simple, containing only the name of the deceased, or could be more elaborate, like those in Attica, that were often decorated with sculpture and contained epitaphs that could, in addition to recording the name of the deceased, include aphorisms addressed to passersby on the brevity of life and the inevitability of death. Perhaps the most famous Greek epitaph is the one composed by Simonides of Cos that records the burial location of the fallen Spartans at the Battle of Thermopylae in 480 B.C.E.: "Stranger, tell the Spartans that we who lie here obeyed their orders."

The epitaph is emulated on the Kohima epitaph (attr. John Maxwell Edmonds) that frequently appears on veteran memorials: "When you go home, tell them of us and say, / for their tomorrow, we gave our today." Other epitaphs associated with famous battles and military service include variations on this sentiment, such as the epitaph that commemorates the British dead at the Battle of Concord, Massachusetts (April 19, 1775): "They came three thousand miles and died / To keep the past upon its throne; / Unheard, beyond the ocean tide / Their English mother made her moan" and the Vietnam Veterans Memorial in Washington, D.C., designed by Maya Ying Lin, which records the names of fallen soldiers in chronological order of date of death. The absence of names on the Tomb of the Unknown Soldier at Arlington National Cemetery adds to the pathos of a monument that celebrates the military service of those denied an individual burial or commemoration.

Latin epitaphs were inscribed on funerary monuments, simple markers (*cippi*), or even painted on small marble plaques (*tituli*). The first known epitaph in Latin is that of L. Cornelius Scipio Barbatus, consul in 298 B.C.E., which was inscribed on his sarcophagus and is now displayed in the

Vatican Museums. Verse epitaphs developed concurrently with elegiac poetry in the late 2nd century B.C.E., and both share the elegiac meter (elegiac couplet of alternating hexameter and pentameter verse). The earliest verse epitaph commemorates Cn. Cornelius Scipio Hispanus (consul in 135 B.C.E.), a descendant of Scipio Barbatus. Elegists such as Propertius, Tibullus, and Ovid, writing in the Augustan period, include epitaphs within the texts of their elegies. The tradition was revived by the Christian poet Ausonius in the 4th century C.E. in his verse epitaphs of mythological figures and his *Parentalia,* a collection of epitaph poems, named after the pagan festival honoring the dead, addressed to his dead relatives.

Not all Latin epitaphs, however, were written in verse. The majority contained information that occupied several lines. Epitaphs could be in the first or third person and, like Greek epitaphs, could include biographical information of the deceased and their survivors or aphorisms addressed to a passerby. Like the modern "rest in peace," a common sentiment expressed a hope for the comfort of the deceased: "may the earth lie lightly on you" (*sit tibi terra levis*). Many Roman *tituli* and funeral monuments, actual tombs, and sarcophagi survive in Rome and are incorporated into museums where they now share exhibition space with famous sculptures of antiquity. Fragments of funerary inscriptions are also displayed in church narthexes and the walls of courtyards and loggias.

Modern epitaphs are valued for their wit or unpretentiousness. Thomas Jefferson makes no mention of his presidency on his epitaph, but the epitaph of Sir Winston Churchill makes light of Judgment Day: "I am ready to meet my Maker. Whether my Maker is prepared for the great ordeal of meeting me is another matter." The epitaphs of famous authors and actors also attract attention. The tombstone of John Keats, who died in Rome, incorporates a lyre and a dictation of his final words: "This grave contains all that was mortal of a young English poet who on his deathbed and in the bitterness of his heart at the malicious power of his enemies desired these words to be engraven on his tombstone 'Here lies one whose name was writ in water.'" The American actress Bette Davis is remembered by the humorous observation: "She did it the hard way."

Contemporary funerary practices have altered the traditional appearance and roles of epitaphs: Newspaper or online obituary notices function as epitaphs even though the text does not appear where the deceased is buried. The growing popularity of green cemeteries, in which the dead are buried in biodegradable coffins with no tombstone in order to have as little an impact on the environment as possible, is also changing commemoration of the dead. Green cemeteries are the antithesis of ancient burials: Whereas funeral monuments in classical antiquity intended to immortalize the deceased, green cemeteries strive to make as little impact on nature as possible by the deceased, who surrenders permanence and textual immortality for environmental responsibility.

Equivocal Death

An equivocal death is one that cannot be neatly categorized as specifically natural, accidental, suicidal, or homicidal. Every death, independent of its cause, is classified by the coroner as one of these four modes. Equivocal deaths are those inquiries that are open to interpretation; they are uncertain and unclear. Occasionally, there is a death which, although clear as to its cause, is ambiguous and equivocal as to its mode, usually between accident and suicide. However, the mode of almost any death can be mistaken for another when the circumstances are not clear. The facts are purposefully vague or misleading as in the case of a staged crime scene. Death is suspicious or questionable based upon what is presented to the authorities; it may resemble homicide or suicide, accident or

natural. It is open to interpretation pending further information of the facts, the victimology, and the circumstances of the event. General guidelines issued by the U.S. National Association of Medical Examiners state that the undetermined manner-of-death classification is to be used "when the information pointing to one manner of death is no more compelling than one or more other competing manners of death in thorough consideration of all available information."

Drug-related deaths can be among the most equivocal as to the mode of death. Proper certification often necessitates knowledge of the victim over and beyond standard toxicological information, including such questions as what dosage was taken (related to the exact time of death) and the time at which autopsy blood and tissue samples were taken; the decedent's weight and build; the decedent's long-term drug habit and known tolerance; and the possible synergistics of other ingested materials.

Death by hanging is usually considered to be instances of suicide (excluding executions). Hanging, like shooting oneself, ingesting a quick-acting poison, or jumping from a high place, is one of those methods by which one reaches precipitously the conclusion of a case of suicide. However, some cases of hanging or asphyxiation are equivocal, such as in the case of deaths involving men who seemed to be engaged in autoerotic activity judged by such features as partial nudity, binding of the body and the genitals, pornographic writing and pictures, and special fetishes such as articles of female clothing, leather belts, and chains. Although the investigation of death orientation of these people may add relevant details regarding their lives (such as loneliness, isolation, hopelessness, and suicide attempts), they should accurately be counted as accidental rather than as suicide. Sometimes a delay of time between the self-destructive action and the death, or intervening events, clouds the direct sequence of cause and effect and creates difficulties in certification.

The certification of the death certificate is a very important item, of great import to the survivors, with implications for insurance, for reputation, even for criminal prosecution. According to classical suicidology, a sizable percentage of deaths (up to 15%) are equivocal regarding the mode, and most of these are eventually certified as accidental, without an adequate psychological investigation. Some of these uninvestigated equivocal deaths are in fact suicides. Pioneer studies conducted at the Los Angeles Suicide Prevention Center by Shneidman and associates recommended that in equivocal cases, the coroner use behavioral scientists to conduct a psychological autopsy, interviewing key survivors who can throw light on the decedent's motivations. It is widely acknowledged that the specialists on whom the coroner traditionally calls (e.g., the pathologist, the toxicologist, the biochemist) can fairly accurately tell the cause of death, but the social scientist is in a pivotal position in cases of equivocal deaths to render the most significant information as to the victim's intention to kill himself or herself. Intention and motivation are neither chemical nor tissue matters; they are psychological in nature. This is where the social scientist can assist the coroner's office.

A new era for understanding equivocal deaths may be identified in the collaboration between a group of psychiatrists or psychologists representing the Los Angeles Suicide Prevention Center and the Los Angeles County Chief Medical Examiner-Coroner (Theodore J. Curphey). In fact, the local medical examiner was interested in studying the cases of death in which a suicide was a possible but not the only possible interpretation. Curphey believed that the central role in an accurate certification of death lies with the coroner, together with the interests of the community's public health. Shneidman had proposed that the motivation is present in some deaths and that a comprehensive taxonomy of deaths must include components that reflect the role of the individual in his or her own death. For example, an intentional death is that in which the decedent played a direct and conscious role in affecting his or her demise, whereas an unintentional death is that in which the decedent did not affect his or her demise. The definition of a subintentional death was then introduced as a death in which the decedent played some partial, covert, or unconscious role in hastening his or her demise, that is, unconscious motivation that contributes to the person's fatal accident, failing health, or even being murdered.

The psychological autopsy is based on the incontrovertible commonsense principle that, in an equivocal death, additional relevant information is always useful. The psychological autopsy method

involves a retrospective investigation of the deceased person, within several months of death, and uses psychological information gathered from personal documents; police, medical, and coroner records; and interviews with family members, friends, coworkers, school associates, and health care providers to classify equivocal deaths or establish diagnoses that were likely present at the time of suicide. In cases of equivocal death, there are at the least three questions to which the psychological autopsy can help find answers: Why did the individual do it? (especially if suicide is the most probable option); How did the individual die? (when a death, usually a natural death, is protracted, the individual dying gradually over a period of time and sociopsychological reasons why he or she died at that time are taken into account); and What is the most probable mode of death? (establish the mode of death with the greatest degree of accuracy as possible). The psychological autopsy focuses on what is usually the missing element, namely, the intention of the deceased in relation to his or her own death.

Certification of equivocal deaths usually lacks any attempts to establish the intention of the decedents with regard to their own demise. Uncertainty about the correct certification is particularly accentuated when the victim's intention is ambivalent, with coexisting wishes both to live and die, or when the self-destructive action is in itself inconclusive, or when death follows the action after a considerable delay.

ESCHATOLOGY

Eschatology deals with questions about the final destination of human beings, including the question of an afterlife. When people face life's finitude, they feel a need for a perspective that extends beyond mortality. In the case of death, they look for a completion of human life that transcends death. More generally, the field of eschatology covers the doctrine (Greek: λόγος) of the end-time (έσχατος). The end-time is one of the primordial problems of human life. The search for ideas and beliefs concerning the end-time is associated with the universal question of whether all humankind and the world can expect a future that transcends the ephemeral, regardless of transience. Religious traditions have devised various responses to these issues. Connected with the question about the end-time, people ask questions about the time of genesis. The question about the destination of human life and the cosmos is linked to the question of their origin, the subject matter of what is known as protology. Where do humans come from before their birth and where do they go to after death? Since the latter half of the 19th century, scholars of religion have tried to collect the various answers to the question about the end-time and to discern broad patterns in these answers. This effort evolved into what is now known as eschatology, which relies on theology, anthropology, psychology, ethics, philosophy, and sociology.

Personal and Collective Eschatology

In the current social climate, eschatology is very much in the limelight. The confrontation with death raises questions when individualization and the secularization of society compel people to find their own answers. In addition, environmental

pollution and climatic change create new scenarios of the end-time. These are depicted in various ways in religions and new spiritual or esoteric trends, as well as in philosophy and public debate.

There is a distinction between personal eschatology and collective eschatology. Personal eschatology concerns what awaits each human individual after death. Collective eschatology deals with the end-time in general. At issue is what happens to humankind and the entire world when time comes to an end. There are many possible answers, of which some examples are described in this entry to illustrate the substance and function of eschatology in people's handling of mortality.

Personal Eschatology: What Happens to Individual Persons After Death?

Personal eschatology focuses on the individual's lot in an ultimate perspective. The question of how individual human beings came into existence or where they come from (protology) raises the issue of where they go or return to after death (eschatology). Eschatology concerns the possibility of continued existence after death. There are various conceptions of life after death, which are viewed from the angle of diverse sources and from different perspectives.

One can distinguish between several dimensions of personal eschatology. The first is an anthropological dimension. The second is a psychological dimension. The third is the religious dimension of personal eschatology. Finally, these three dimensions give rise to an ethical dimension of personal eschatology.

Anthropological Dimension of Personal Eschatology

Anthropologically, eschatology provides a substantive bridge between the world of the living and the world of the dead. This bridge is often portrayed ritually. According to the scholar of ritual Arnold van Gennep, death entails a twofold transition. The survivors make a transition from life with the deceased to life without that person. At the same time the deceased makes a transition from the world of the living to the world of the dead. In van Gennep's view, the transition always proceeds in three phases: One is separated from the world of the living (first phase), one finds oneself in a sort of intermediate state between life and death (second phase), and finally one is incorporated into the world of the dead (third phase). This classically structured rite of passage shows that there has to be a link connecting the worlds of the living and the dead. To the survivors, eschatology offers images of the world of the dead that can provide such a link. One possibility is that the deceased is initiated into a new life after death, enacted in, for instance, deathbed or funeral rites. Initiation into the world of the dead could mean the final step in a person's life. Already among the ancient Egyptians one finds the view that heaven is a person's final destination, from which there is no return.

Another conception is that the deceased makes a transition to ancestorhood. That makes the person an object of ancestor veneration and, as such, accessible to his or her relatives. This kind of eschatological image concerns the deceased and his or her destiny. It also concerns possible communication with the deceased that bridges the gap between life and death. Through ritual activity the surviving relatives can contact the dead. Through lamentation or, in some cultures, a "second funeral" some time after the person's death, people are able to remain in contact with the deceased, as described by Robert Hertz. In this way the deceased can act as a mediator between the here and now and the hereafter.

Psychological Dimension of Personal Eschatology

According to psychological theory, the question of people's destiny after death is deeply rooted in the human psyche. The psychologist Robert Lifton maintains that people have an inescapable need to ensure continuity in the face of death. This happens by way of what Lifton calls "symbolic immortality" in the form of images of life after death that facilitate the psychological mechanism for coping with bereavement. Thus it has a place in eschatology, as it affords a psychological slant on human beings' ultimate destiny. Lifton distinguishes between different modes of immortality, which reflect the need for symbolic images. The first is the biological mode, in which people live on in their descendants. Then there is the creative mode, which means that people are immortalized by their legacy, their work, and their relations with others. The third is the transcendental mode, which includes religious conceptions of life after death. The natural mode of immortality traces

human survival in nature. The cycle of nature continues even after the death of the individual person and everyone is included in it. Lifton's final mode is experiential transcendence, which entails transcending the limits of time, space, and, ultimately, death through an experience of self-transcendence. This experience enables people to find a destiny beyond death. The question of personal destiny that is the subject of eschatology is a psychological mechanism to deal with death, be it one's own or that of a loved one. Thus empirical research has shown that the biological mode of immortality actually helps people cope with death. Robert Kastenbaum found that 90% of people with children and grandchildren can handle death more easily than those with no progeny.

Religious Dimension of Personal Eschatology

Religious personal eschatology has two basic notions. According to the first notion, the individual—a person's body or ego—is the mortal shell of a permanent principle, which continues to exist even after the shell, the individual person, perishes. The second possibility is that the person as a whole—body and mind—lives on after death. In that case the actual individual, including his or her body, does not perish. This notion of a permanent principle is found, for example, in Eastern religions. When a person is reborn, he or she is no longer the same incarnation as before his or her death. The individual has died and no longer exists; the permanent principle remains.

The second possibility—survival of the entire person, often including the body—is found in prophetic religions. In Christianity the resurrection means that the entire human being lives on in heaven after death. This second kind of religious conception of life after death often centers on religious events entailing a particular hope of salvation. An example is the death and resurrection of Jesus Christ. Because of this event, Christians believe that they will follow Christ after their death. As in the case of Christ's resurrection, a salvific event may be followed by disappointment. After Christ had risen and ascended to heaven, his disciples expected his speedy return to earth and the dawn of the end-time (*parousia*). When that did not happen, the idea took shape in personal eschatology that after their death, all people would rise with Christ. In early Judaism the resurrection of the dead played a minor role. Only in Greco-Roman thought does one find a stronger belief in the resurrection. Nonetheless one finds a reference to the resurrection in the Hebrew Bible's book of Daniel 12:2: "Many of those who sleep in the dust will awake." On the day of the last judgment three groups of people will rise again: the righteous, the wicked, and those in between. The righteous are given eternal life, the wicked go to hell, and the fate of those in between is negotiable. We observe that God's judgment will play a prominent role and that the notion of the hereafter is divided into different parts: heaven, hell, and sometimes an intermediate state, known in Catholicism as purgatory. In Islam, too, the idea of paradise that will not be attained by everyone plays a major role. All of these images represent a belief in life after death that makes the world of the dead religiously conceivable to the living—in Islam, for example, in the form of a luxuriant garden.

Ethical Dimension of Personal Eschatology

The eschatological notion that humans are judged after their death involves an ethical component. In what are known as redemptive religions, death is followed by reward for a virtuous life or punishment for an evil life. In the Abrahamic religions humans' fate after death depends on the way they lived their lives. It is a major motivation for ethical living. The idea of purification after death implies that after their death, people can do penance for sins committed in their lifetime. In Catholicism this happens in purgatory. After a spell of purification, they can still enter paradise. Religions that assume the survival of the eternal core of the person rather than the survival of the entire person also have this ethical component. In the Buddhist view the karma that people accumulate in their lifetime by doing good deeds determines in what way they will be reincarnated. This ethical component means that there is a close connection between a person's earthly life and the life after death expressed in personal eschatological ideas.

Collective Eschatology: What Happens to Groups at the End of Time?

Apart from individual conceptions of what happens to people after death, there are many notions

of the end-time for humankind as a whole or even the entire world. End-time scenarios in collective eschatology are almost invariably linked with religious images: A transcendent power influences the fate of humankind and the world. Usually this happens in the history of a particular group. Hence collective eschatology has three major aspects: a historical aspect, a transcendent aspect, and a social aspect.

Historical Aspect of Collective Eschatology

Especially in the Abrahamic religions, eschatology is historically inspired. In Judaism, for instance, this means that God intervenes decisively in history, because God is superior to the world and its events. At a given time all of this will culminate in God's ultimate appearance in history—a time when mundane limitations will no longer apply. In Judaism God's appearance in history means the coming of the Messiah and a political and social revolution. The end-time or *Eschaton* means that God will wage war on evil people—the enemy—and injustice. The Babylonian Talmud points out that the future world will not be the same as the here and now: There will be no eating and drinking, no procreation, and no rivalry between people. The righteous will be exalted with crowns on their heads and will bask in God's presence. There will be no more death, no cares, and no tears. All that remains will be observance of divine law, a crucial element of Judaism, which will then be taught by God. Often these salvific hopes stem from people's real-life historical circumstances, the earthly injustices that the people of Israel experienced time and again.

Despite all dangers, Judaism interprets all history as God's way with his people of Israel—what is known as salvation history. That means that God sees to it that his people continue their journey through the ages and will ultimately inherit a good future. A key symbol of that future is the promised land. This is linked with the notion that God will keep his promise to Israel: The people will be restored in the promised land of Israel, and the sacrificial cult will be practiced once more in a rebuilt temple. Historical eschatological ideas help people to live with the wretchedness of daily life. Collective eschatology seeks to keep an ultimate perspective alive for a group of people, a perspective that includes the individuals and their personal finitude.

Transcendent Aspect of Collective Eschatology

As in personal eschatology, where a link is established between the world of the living and the world of the dead, collective eschatology links earthly life, human life, and the divine. Divine reality represents transcendence. In eschatological images, God, the transcendent par excellence, arrives in immanent reality. As a result, the disparity between the divine and the human world will eventually be overcome. In Judaism, however, one finds that despite the bridge between the transcendent and the immanent, there is some hesitancy when it comes to concrete images of that link. These would make it too tempting and will distract people from the here and now by overaccentuating the end-time.

In Christianity the coming of the Messiah heralds a new step in salvation history: God who has finally revealed his salvation. The person of Jesus Christ represents the embodied link between the transcendent and the immanent. Jesus is both divine and human. That means that in Jesus, God himself became immanent and thus made transcendence accessible once and for all. It should be remembered, however, that Christian doctrine also includes the Messiah's return to earth and the end of time. On that day all people will be judged, the living and the dead. At the last judgment transcendence will be victorious, a notion also encountered in Islam in the form of angels that will report the good and evil deeds of every person to God. The individual's fate after death is, in that sense, included in collective eschatology.

Social Aspect of Collective Eschatology

The social aspect of collective eschatology, too, assigns the lot of the individual a place in the destiny of a larger group, a collective. In the Abrahamic religions, collective eschatology occupies a prominent place alongside the image of individual salvation: For the chosen people the latter is linked with the collective salvific events of the end-time. On Christ's return to earth, all good people will follow him to heaven. That makes life, as well as people's ultimate destiny, by definition social.

But how do individual and social destinies relate? Here we find an apparent contradiction between collective and individual eschatology: It is not clear when a person is ultimately judged and redeemed. This might happen immediately after death or only at the end of time. In the latter case, the question is what happens to dead people between the time of their death and the end of time. These contradictions remain unresolved. What we have is two different versions of the afterlife of individuals and social groups. It remains a point of theological dispute. Islamic theology explains what happens to the dead after death until the opening of the graves as follows: After death, deceased people remain in a kind of sleep, from which they will wake in due course.

In recent Christian theological trends like liberation theology, the social aspect is heavily emphasized. God's presence transforms the here and now on earth, including people's social coexistence. In the face of all threats to creation and every injustice, God will ensure that the world attains a good future. Because of the salvation of Christ, even the natural evolution of the world will go the right way. More especially, the political and social world can take a positive turn through God's intervention.

Alternative Eschatological Notions

Apart from the collective eschatological notions in Abrahamic religions, there are many other variants. Some apocalyptic groups have end-time scenarios predicting a more negative prospect for humans and the earth. Some groups calculate the exact time of the end of the world and direct their lives wholly to that hour. This may be associated with a negative impulse for life on earth: Earthly life is not considered worthwhile because its end is approaching. But by and large, eschatology represents an attempt to infer a positive impulse for human life in terms of the question about the end-time. That applies particularly to the way death is handled. Eschatological notions, both personal and collective, are attempts to impart meaning to the end of an actual life that forms part of earthly reality and will eventually be part of divine or transcendent reality at the end of time.

Eschatology in Major Religious Traditions

The concept of eschatology, or the study of the last days, is derived from the Greek words *eschatos* and *logos*, the combined meaning of which is the study of the end or last things. Thus, it refers to the final events in religious history or the history of the end of the world. Eschatology can be a symbolic end to material reality and the reunion with God. This may also refer to the end of a religious cycle or age by the return of a manifestation of God or Messiah in the end-time.

Many contemporary religions and cults promote fear of an apocalyptic end of the world, a

literal destruction of humanity and the earth. Other religions view the end as a gate to a new religious era. This entry discusses these issues in the context of the major religions of the world.

Bahá'í Eschatology

The Bahá'í faith is the newest world religion and second only to Christianity in its worldwide presence. A Bahá'í is a follower of the 19th-century "manifestation of God" named Bahá'u'lláh. Bahá'ís believe in a twin manifestation and forerunner to Bahá'u'lláh who took the name the Bab (the Gate). The Bab's ministry ended with his miraculous martyrdom witnessed by thousands in the city of Tabriz. Bahá'u'lláh fulfills prophecies from past world religions about the return of their messenger in the latter days to gradually usher in God's kingdom on earth. Bahá'u'lláh represents the Promised Lord of Hosts for Jews, the Immaculate Manifestation of Krishna for Hindus, the Buddha of Universal Fellowship for Buddhists, the return of the World Savior for Zoroastrians, the return of Jesus for Christians, and the Great Announcement for Muslims. His teachings and administrative order form the foundation for the gradual enfoldment of a future world theocracy based upon the best elements of governments. His coming fulfills prophecies symbolically represented by such language as the day of judgment, the resurrection of the dead, or end of the world.

Bahá'ís believe in the oneness of God and his manifestations, including Moses, Buddha, Krishna, Zoroaster, Muhammad, the Bab, and Bahá'u'lláh. All world religions contain a commonality as evidenced by the belief in the "golden rule," reward and punishment, the existence of heaven and hell, and the struggle between good and evil. Bahá'ís believe that contradictions in their dogmas and beliefs of various world religions are due to human misinterpretations and/or misquotations by religious leaders and scribes representing them.

Some of Bahá'u'lláh's spiritual teachings for this new era are the reality of heaven (closeness to God) and hell (remoteness from God), the efficacy of prayers for the dead in assisting the soul's progress in the afterlife, the harmony of science and religion, universal weights and measures, the elimination of all prejudices, the equality of men and women, universal auxiliary language, universal education, and the gradual development of a world theocracy spawned by global unity.

Buddhist Eschatology

There are three ways in which Buddhism exhibits a concern for final events: personal eschatology, cosmic eschatology, and cultural eschatology. First, Buddhism at its very essence is directing the adherent to achieve a personal end to the experience of *samsara*, or the cycle of birth, death, and rebirth. Engaging in ethical and meditative practices brings the adherent to a state of realized *nirvana* (a state of extinguishing of desire). After Buddha was enlightened, his first sermon was about the Four Noble Truths, which relate to the suffering, origin, cessation, and the path leading to cessation. The first Noble Truth indicates that life is a state of *dukkha* (suffering); the second Noble truth states the source of this suffering is desire. The third Noble Truth recognizes a state of no desire (nirvana), which is a state of nonsuffering. The fourth Noble Truth identifies a path to follow in extinguishing desire (*tanha*). Buddha called himself the Awakened One.

In Mahayana Buddhism the eschatological goal of realization is to become a *bodhisattva* rather than to become an *Arhat*, which is the ideal striven for by a Theravaden Buddhist monk. It is not just freedom from suffering that holds the key to a personal realization, but there must be a compassionate involvement with the lives of others and commitment to their awakening. The personal end of nirvana is postponed as the bodhisattva remains in this world to assist others to realize nirvana. One such example is Sakyamuni Buddha, who, after his awakening, became a teacher and counselor for 40 years.

The second way Buddhists view the end things is through the belief that there are cycles of manifestation and unmanifestation. The cycle of manifestation will come to an end and a cycle of unmanifestation will begin and end, and then a new cycle of manifestation will begin. This is cosmic eschatology, or a reflection of the natural order of things. In each phase of manifestation the beginning is marked by perfection, but perfection degenerates into imperfections such as immorality, sickness, and war. Human behavior creates the cycles and drives the movement toward an end to the cycle. A complete cycle is called a great eon.

Buddha thought the urgency of dealing with the problem of suffering did not leave a person time for speculation. He was a healer and a pragmatist who wanted people to be free from suffering. The foundation of Buddhist thought is based on conditioned reality, namely, that all things are conditioned and hence must pass away; even the phenomenon of manifestation must too pass away. Thus, understanding and accepting the conditioned nature of manifestation is essential to eliminating suffering. At the center of Buddhist insight is the conviction that ignorance is the source of all suffering; hence ignorance of the conditioned nature of manifestation is responsible for all suffering.

The third way in which Buddhism addresses final things is referred to as cultural eschatology. All things are conditioned and hence not unchanging and eternal, meaning that Buddhist teaching (*dharma*) is conditioned and hence is not an unchanging dogma. So there is a teaching in Buddhism that Sakyamuni Buddha's dharma, or teaching, will also come to an end. Buddhist teaching is founded by a particular individual and is conditioned by a particular culture and community of adherents who live in particular social circumstances. Human beings make mistakes, and hence the tradition itself is fallible. So Buddhist teaching cannot be unchanging and will then, at some point, pass away and be replaced by a new dharma. In early Buddhist thinking the belief existed that Buddhist teaching would fade away after 500 years. With the passage of the first 500 years, it was projected that Buddha's teaching would last 1,000 years. But that timeline has also passed, and new ways of interpreting the core belief into the conditioned nature of Buddha's dharma have arisen.

A well-established tradition exists that projects the appearance of a new Buddha once Sakyamuni Buddha's teachings are forgotten. Identified as Maitreya, the calculations for his appearance range in the billions of years from now. The prophecy predicts that Maitreya will attain bodhi within 7 days and will usher in a true dharma that will bring worldwide peace and harmony.

Christian Eschatology

Christian eschatology had its beginning in the early church's experience and expectation that Jesus Christ, after having died, resurrected, and ascended, would return in the future to bring about the end of the world, ushering in a new and lasting kingdom of peace. Early Christians believed that the *Eschaton* (end-time) was near and expected Jesus to return in their lifetime. When this did not happen, many new interpretations of the Eschaton arose.

Apocalyptic eschatology has its origin in the Hebrew scriptures in times when the righteous were suffering undeservedly while the unrighteous thrived. This state of affairs calls God's justice into question. Apocalyptic eschatology arose in order to project a future time in which God's justice would be realized and this trend would be reversed. Apocalyptic literature foretold an end of the world and a coming of the reign of God. Jesus was well aware of these apocalyptic voices and, in passages like Luke 11:20 and Luke 17:20–21, affirmed a prophetic eschatology. In these verses, Jesus is not foretelling a future event but rather a current event in which the demonic world of the sinner is shattered. He proclaimed God not as the one who ends the world but rather as the one who shatters this interpretive world in order to bring it under his kingship. The prophets proclaimed God's presence in the world. Prophetic eschatology announces that God is already present and tells where and how he is present. There are also passages where Jesus foretells an apocalyptic end to the world (Matt. 24), and so both traditions have ensued.

These two types of eschatological visions are found in some current thinking. Apocalyptic eschatology can be found in some Protestant debates about premillennialism, amillennialism, dispensationalism, and preterism. Although most Protestant churches are amillennialist (i.e., they hold that the rule of Christ has already begun), there are a significant number of churches that are premillennial and dispensationalist. Seventh-day Adventist eschatology is premillenialist because the membership believes that Christ's Second Coming will precede the 1,000-year rule of Satan on earth. Dallas Theological Seminary is considered the leading advocate of dispensational eschatology, which holds that different dispensations have defined humans' obligations to God. As far as the end-time is concerned, there will be a dispensation of a kingdom age after Jesus returns and the tribulation ends. Premillenialism is preached from most Baptist pulpits, but reformed eschatology tends to be amillenialist. Presbyterian

churches tend to be postmillennialist, which holds that the millennium has already occurred.

Premillennialism and dispensationalism are based on apocalyptic passages in the scriptures (Matt. 24, the book of Revelations, and 1 Thess. 4:16–18) and hold that there will be a second coming of Christ. The forces of evil are overcome, and finally a day of judgment occurs in which the person will be judged worthy of heaven or hell.

Some Church of Christ congregations embrace preterism in objection to scriptural literalism that is taking place in the previously described apocalyptic eschatologies. Preterism is the belief the events that are prophesized have already occurred in the New Testament era. The war of Armageddon is believed to have occurred during the late 60s and early 70s C.E., when the Jewish Temple in Jerusalem was destroyed. So when Jesus was teaching about the coming of the end of the world, he did not mean that the world would be destroyed but rather the world of the Old Testament and the belief that only Jews were included in God's plan of salvation. This position is further divided between full preterism and partial preterism, which holds that not all of the prophecies in the New Testament have already been realized.

The Catholic Church has traditionally been amillennialist in its views, although it does not use this term. Beginning with St. Augustine, the Catholic Church has affirmed the presence of the final age as having already been inaugurated by Christ. The Vatican II Council (1962–1964) affirmed this view and held that the restoration of the world had already begun in Jesus, is being carried forward through the Holy Spirit, and continues in the church. Vatican II documents call the Catholic Church the "pilgrim church" to indicate that it is on the way to transforming the present world to be in Christ's image. The Catholic Church holds there is an afterlife of heaven or hell or purgatory where sinners are purified; it also professes the return of Christ, the resurrection of the dead, the universal judgment, the communion of the saints, the existence of angels, and the suffrages of the dead.

Hindu Eschatology

Two concerns for end things are found in Hinduism. The first concern delineates a personal eschatology as well as a cosmological eschatology. The two complement one another as both comprise repeated cycles. A personal eschatology is found in the doctrine of *samsara*, a cycle of birth, death, and rebirth. Hindus believe that this cycle is one of difficulty and suffering. One escapes this cycle by becoming enlightened (*moksha*). This cycle is driven by *karma*, which is the natural law of consequences of sowing what you reap. Bad deeds result in the accumulation of bad karma, and this karma is carried over into a new reincarnated life after death. Good deeds accumulate and carry over as well and determine what kind of life form one will experience in the reincarnation.

Hindus hold that there is a true self (*Atman*), which persists in death and is reincarnated in a new body. To escape this cycle of karma-driven birth, death, and rebirth, Hindus believe they must come to the realization that their Atman is really one with Brahman or universal reality. This event of moksha will release the Hindu from the endless cycle of samsara. Although these beliefs can be found in the Vedas, which are the primary Hindu scriptures (*Shruti*), they can also be found in *Smriti* literature such as the *Bhagavad Gita*.

Correspondingly, the *Puranas* contain a clearly defined cosmological eschatology. These Smriti texts portray a cyclical universe that engages in 1,000 cycles of deteriorating ages during which the world is dissolved and recreated. Each cycle (*kalpa*) of creation and destruction is made up of 2,000 *mahayugas*. Each mahayuga is constituted by four ages or *yugas: Krita, Treta, Dwapara,* and *Kali*. Most Hindus believe that the current age is in the Kali yuga, the age of darkness, and this final age is the most degenerated. Each cycle begins with a golden age, but degenerates into war, decadence and immorality. When virtue and religion are practically nonexistent and humanity overwhelmed with evil, a 10th and final avatar of Vishnu will be born. This incarnation will be called Kalki and will ride on a white horse wielding a flaming sword. In a time span of three nights he will destroy all evil human beings, vanquish death, restore the true dharma, and reconcile opposites, while preserving the righteous few. Kalki will then usher in harmony and peace in a new era of Krita yuga. This new golden age will begin another cycle of yugas. This age will then digress from the state of perfection to decadence to complete another cycle.

Finally, after 1,000 cycles of deteriorating ages, the entire cosmos will dissolve including the world, gods, and demons, while all energy is absorbed by Brahma (God). Following this, chaos will prevail. Brahma rests during this phase until it is time for a new creation and a new cosmos is born of a cosmic egg.

Jewish Eschatology

Three main directions of eschatology can be perceived in Jewish traditions. First, there is a messianic eschatology that looks forward to a time in which Israel will be redeemed and restored. Second, there is a belief in an afterlife during which souls commune with God. Finally, there is a belief in the resurrection of the body, after which it is reunited with the righteous soul. There are distinct differences in the way these beliefs are understood, however, within Orthodox, Conservative, and Reform Judaism.

Hebrew scriptures portray an intimate relationship between *Yahweh* (God) and his people, namely the Hebrews, the Israelites, or the Jews. In the beginning, Yahweh created the earth good, but humans introduced sin and injustice. Yahweh acts then in history to save his people and call them back to him. He enters into a covenant with them and they are to follow his laws. When they do, each will be blessed, but if they do not, then curses will descend upon them. Scriptures describe how the people fail repeatedly, and then the idea arises that they need a king. Yahweh gives them a king, but even the kings they receive are weak and sinful. The 10 tribes of Israel are dispersed and assimilated among the Assyrians. Later the people of Judah are carried off into the exile in Babylonia. Out of the postexilic scriptures such as in Isaiah (24–27), Ezekiel, and Daniel (7–12), an eschatological messianism arose. There is hope for a "Day of God" when a ruler descended from the line of David will come and establish God's rule upon the earth and the righteous of Israel will be restored and redeemed. This Messiah (*Moshiach*) will be the *anointed one*, chosen to bring judgment on the enemies of Yahweh (both Gentile and unfaithful Jew). The Messiah will be heralded by great signs upon the earth. The Messiah will also bring about the unification of the divided Kingdom of Israel. The Temple in Jerusalem will be rebuilt, and the ancient form of sacrificial worship will be restored. The whole world will worship one God, weapons of war will be destroyed, and death will be swallowed up forever. Peace and joy will reign.

Orthodox Jews still hold as a tenet that a personal Messiah will come some time in the future. Conservative Jews, however, believe in a messianic age rather than a personal Messiah. Reform Jews hold that in this messianic age, reform and redemption will take place, but there will not be a personal redeemer.

Given the inequities of this life and the ancient Israelites' experience of unjust suffering, Judaic ideas of resurrection and afterlife arose in the Maccabean period. The afterlife, *Olam Habah*, is a time when souls are disembodied after death, and the righteous souls commune with God. Unrighteous souls are thought to be in *Gehenna*, which is a word taken from the name of the valley of fire where children were sacrificed in burnt offerings. Sometimes the afterworld is referred to as *Sheol* (grave). The unrighteous are not thought to spend more than 11 months in Gehenna in order to be purified. Thus, the *Kaddish* (memorial prayer) is recited for only 11 months. Orthodox views on the afterlife are strongest among Conservative Jews, while Reform Jews tend to be this-worldly.

The ancient Pharisees held to a belief in bodily resurrection. Passages in the Hebrew scriptures support this belief, for example, those found in Ezekiel 37, Daniel 12:2, Job 19:26, and Isaiah 26:19. Conservatives remain divided on the issue, and Reform Jews outright reject bodily resurrection.

Islamic Eschatology

In Islam, death ends physical life and the beginning of a period of rest until the day of resurrection when human souls will enter heaven. On that day God will judge the living and the dead. Muhammad, the prophet of Islam, is said to have ascended to heaven to visit the seven heavens (in some accounts, hell as well). Muslims believe that the final end of a person's life will be heaven or hell.

In Islam one's deeds play an integral part in forming one's spiritual condition, salvation, and station in the afterlife. Behaviors are never without consequences—be they corporeal, spiritual, immediate, or deferred. Accordingly, consequences involve

an interaction of various factors, such as one's intentions, will, and penitence. Every factor surrounding and including one's deeds shall be judged. Furthermore, one's actions are, in a way, a token for increased spiritual awakening within the lower realm of this world; this is because there is constant flux of interaction between one's spiritual and psychological states with behavior. Good behavior is not necessarily motivated by the prospect of salvation but is more a vehicle for journeying closer to God. In Islam emphasis is assigned to the moment of death, when one's faith should not waiver. Hence, faith at the moment of death plays a crucial role in one's position in the afterlife. The crux of eschatology lies in part in the sequential transmigration of souls in the afterlife after experiencing earthly trials and suffering. Death can offer a release from this suffering via the eternal joy of paradise.

A soul's ultimate destination is either heaven (reward) or hell (punishment) wherein one would dwell eternally. The afterlife is multifaceted, featuring many levels, differing in intensity. Heaven is seen as a realm built under an infrastructure that is distinctly different from this world and is a condition graphically portrayed as glorious and eternal. Hell is a fiery realm where evil persons are punished. Evil persons have visions of hell. Except for these visions, the soul remains in a kind of soul sleep until Judgment Day, when everyone is judged according to their deeds. Many Muslims believe that non-Muslims can attain heaven only after experiencing the purifying fires of an intermediate condition of purgatory—similar to Zoroastrian and Catholic beliefs. In this Day of Judgment, the Qur'an invokes a calamity that implies some kind of radical transformation of life.

Cosmic eschatology is addressed in one of the six articles of faith of Islam. Like some fundamentalist Christians, Islam teaches that the dead will be bodily resurrected. Hence, the body dies and decomposes, but the soul lives on. Salvation comes to the righteous and damnation to the wicked. Islamic eschatology is focused on the Last Judgment, the end of the world, and the coming of a world Savior, who will then fill the earth with peace and justice such as never before achieved. Shi'ites believe that al-Mahdi will reappear when the world has fallen into chaos and civil war. The Mahdi comes wielding the double-bladed sword. Sunni differ, with some believing that Jesus will return and others thinking the Mahdi will be an ordinary man.

Islamic eschatology of Muhammad has been divided into major and minor signs. The former includes the rising of the sun from the West, descending down of Jesus, the appearance of Yajuj and Majuj, and three sinkings (or caving in of the earth): one in the East, another in the West, and a third in the Arabian Peninsula. The last (sign) will be that of the fire that will start from Yemen and drive the people toward the place of reckoning.

Zoroastrian Eschatology

Zoroastrian eschatology is concerned with final things, that is, the advent of the Savior to defeat evil and the end of the world—a necessary conclusion to the creation story. Zoroastrianism (1800–1500 B.C.E.) is possibly the oldest religion. Zoroastrians (Zardishti) are followers of the Messenger Zoroaster. This dualistic religion believes in two opposing forces. There is one universal, transcendent God (Ahura Mazda) and his angels. In opposition is the demonic figure of Angra Mainyu, who is aided by evil spirits (Daevas). The world and all that was good was created by Mazda. Any worldly corruption is an effect of Angra Mainyu's influences. The Avesta (including the Gathas) is the holy book of Zoroastrianism which includes eschatological passages. Zoroastrian magi (priests) appear to have been the main augmenters of apocalyptic conceptualizations. Zoroastrianism has links to both Western and Eastern religions.

The Avesta has three eschatological themes: individual, universal, and apocalyptic. Mazda's creation involves the conflict between good, truth, and order and is the opposite of evil, falsehood, and disorder. One's free will to choose behavior determines where the person goes after death. Deeds, not beliefs, determine salvation in the afterlife. Zoroaster spoke of the fate of the dead. After 3 days comes the separation of the soul from the body. Every soul is first judged. Good souls are assigned to heaven (Infinite Lights) across a spiritual bridge of separation. Evil souls will be vexed at the Bridge of the Compiler and assigned to hell (House of the Lie) for eternity. Souls undeserving of heaven or hell go to an intermediate area called limbo (e.g., similar to Catholic purgatory). To

reach a succession of increasingly "infinite lights" requires the person to possess pure thoughts, words, and deeds.

Universal and apocalyptic eschatology described in the Gathas is dominated by an idea of fire. Good souls at the end of the world will be separated from the evil ones by a torrent of molten metal (for purification of all—including the sinners). At that time, the last judgment takes place. Life and the world will be transformed then. Through a ceremony, the dead will be resurrected with indestructible glorified bodies.

Finally, Zoroastrianism makes a distinction among (1) the fates of human souls after death and of humanity at the end of the world, (2) the various heavenly habitats which the souls are assigned to after death and the division of humanity after the final judgment, and (3) the events leading to the final end of the world after it becomes a new earth. Like most world religions, it's a millennial religion. There are three future saviors to come at different stages in history after Zoroaster. The first two (he who makes truth grow and he who makes reverence grow) prepare humans and the world for the final Messenger or Savior (he who embodies truth), who ushers God's kingdom on earth.

Estate Planning

Estate planning is the process by which an individual transfers property to his or her heirs and other beneficiaries while minimizing the associated costs and taxes. Estate planning can also ensure that one's financial and medical matters are handled as desired after incapacitation or death. An estate is the total property owned by an individual prior to distribution through a trust, will, or based on state intestacy laws. The process of estate planning, which is the focus of this entry, includes taking an inventory of all assets, discussing important decisions with family members, such as who will serve as the guardian for any minor children, making a will and/or establishing a trust, and considering a living will, power of attorney, and life insurance. Many individuals also create estate planning strategies to minimize the estate taxes they pay. The issue of estate planning applies to all individuals, as every individual will eventually face death.

The first step of estate planning is taking an inventory of all assets, including residential property, other real estate, savings, investments, pensions and other retirement accounts, life insurance policies and annuities, business ownership interests, motor vehicles, jewelry, collectibles, and other personal property, and assigning a value to each asset. Professional assistance may be needed to assign realistic asset values. The main reason that every individual needs an estate plan is beyond the factor of taxes. Benefits of estate planning include making sure assets go where one wants them to after death, controlling assets while alive but incapacitated, minimizing the emotional and financial burden on survivors, minimizing feuds among survivors regarding one's estate, increasing the amount available for charitable donations, avoiding the cost and time of probate, and providing terms for a guardian of minor children.

Many people avoid or delay discussing estate planning for several reasons. Many do not want to face a subject that is related to mortality. Discussions of estate plans may lead to family conflicts, and many individuals do not want to discuss money with their successors. Many individuals are also hesitant to invest the time and money required to create an estate plan. The lack of an estate plan can lead to increased taxes in addition to unnecessary conflicts, anger, and confusion among the survivors, and it can also require more of the survivors' time. Individuals are encouraged to have a minimum of four estate planning tools, including a will and/or trust, a living will, a medical power of attorney, and a durable power of attorney.

Wills

A will is a legal document that specifies the transfer of one's property and assets after death, and its main purpose is to ensure that one's assets go to designated family members or other beneficiaries. About half of all Americans die without having a will, which means that the court distributes the decedent's property according to state laws, which may or may not coincide with the decedent's wishes. If an individual has no apparent heir, which is one whose right to an inheritance cannot be voided or undone except by exclusion under a valid will, it is possible for the state to claim the estate.

Probate is a legal term and involves proving a will. During probate, the court determines whether a signed will is a genuine statement of how the decedent wished the estate to be distributed. The probate process may take a few days or several months depending on the state of residence. The complexity of the will affects the expense of the probate process. Careful planning can be used to expedite or avoid the probate process.

Each state has specific requirements for a valid will, but a will can generally be written by any individual over the age of 18 who is mentally capable. For a will to be valid, it must comply with the laws of the state in which one lives. Only about half of the states recognize wills not drafted by a legally trained person. State laws may also require the usage of specific language, a particular form of signature, and/or a specific number of witnesses of a certain age when the will is signed. A will is also used to designate a guardian for minor children in the event of the parent's or guardian's death, without which the court may appoint a guardian.

Basic elements of a will include the individual's name, place of residence, and description of assets; names of spouse, children, and other beneficiaries, as well as names of alternate beneficiaries; specific gifts; establishment of trusts; cancellation of outstanding debts owed to the individual; names of a guardian and alternative guardian for minor children; name of the estate executor; and the individual's and witnesses' signatures. The executor is the person who executes the instructions in a will. This individual must be able to handle all of the financial matters involved with settling an estate. Some states require the executor to be a state resident. An executor is responsible for collecting the decedent's assets, paying creditors, paying taxes, notifying Social Security and other agencies, cancelling credit cards, and distributing assets according to the will. Being an executor is time-consuming, and executors are generally paid for their services.

Trusts

Trusts, as opposed to wills, eliminate the need for probate, which is a lengthy and costly process that oversees the transfer of assets. Trusts are also sometimes used to make gifts while the donor is still alive in order to minimize taxes. When a living trust, a device in which an individual holds

property as a trustee, is made, the surviving beneficiaries can transfer the property quickly and easily. The two most common types of living trusts are (1) a basic living trust for an individual or couple, which avoids probate; and (2) an AB, or credit shelter trust, which avoids probate and also reduces estate taxes. To create a basic living trust, an individual, called the grantor, transfers ownership of some or all property to the living trust. A person is named in the trust document to take over the trust after the grantor dies. A credit shelter trust lets a couple pass the amount of property to their beneficiaries after both spouses die while ensuring that the surviving spouse is financially stable during his or her lifetime. Rather than leaving property outright to a surviving spouse, each spouse leaves the property to a credit shelter trust and names final beneficiaries. When one spouse dies, the surviving spouse can use the property with certain restrictions but is not the outright owner of the property. Therefore, the property is not subject to estate tax when the second spouse dies, because the second spouse was never an "owner" of the property.

Living Will

A living will is an advance health directive, or a written declaration of what life-sustaining medical treatments an individual will allow or not allow in the event of incapacitation. It is a legal instrument and is often notarized or signed in the presence of witnesses. In a living will, for example, a person may request that he or she is not resuscitated in the case of cardiac or respiratory arrest. Family members and medical institutions often challenge the meaning or validity of living wills, so considerable care and specify are required when creating such documents.

Medical Power of Attorney

A medical power of attorney is a document authorizing a person, or agent, to make medical decisions on behalf of another individual, the principal, ultimately to carry out what the principal specifies in the living will. The medical power of attorney is effective indefinitely, unless a termination date is specified. The agent makes health care decisions for the principal only in cases in which a physician certifies in writing that the principal is incompetent. The agent should be a trusted person who understands the wishes of the principal and who will be strong enough to carry out those wishes although other family members or survivors may object.

Durable Power of Attorney

A durable power of attorney is a document for estate planning that enables an agent, or a named representative, to act for the principal, or the person drafting the document, after the principal becomes ill, incapacitated, or unable to make decisions. It allows an individual to select another person, such as a spouse or adult child, to serve as a representative, performing certain actions in specific cases, such as incapacitation. That representative can pay bills or make major financial decisions on behalf of the principal, depending on the limit of the powers. Without a durable power of attorney, an individual's spouse or other family members would need to seek approval from the court to carry out financial transactions. The durable power of attorney is effective until it is revoked by the principal or until the principal's death. In some jurisdictions, a living will and durable power of attorney are considered to be the same thing.

Life Insurance

For those who have dependents they wish to support in the case their own death, life insurance is an important part of estate planning. Life insurance is a contract between the policy owner and the insurer, where the insured pays a specific amount each period, called a premium, and in return, the insurer agrees to pay a certain amount of money upon the insured's death. In the United States, life insurance contracts generally specify a lump sum to be paid to the beneficiary in the case of the insured's death, while different trends are followed in other countries. Specific exclusions are written into life insurance policies to limit the liability of the insurer, such as no payment of benefits in the case of suicide, fraud, or war. Within estate planning, life insurance can have several functions, first of which is to provide family protection in the case of premature death. Such policies can also be used to protect the assets in one's estate from catastrophic loss or lawsuits, as an asset to pass on to

others, or to pay for estate taxes. Small business co-owners often use life insurance policies to buy out the deceased's portion of the business.

There are two types of life insurance policies: term and permanent. Term life insurance provides life insurance coverage for a specified number of years for a specific premium, whereas permanent life insurance continues until the policy is paid out or the owner fails to pay the premium when due. The proceeds from a life insurance account are not subject to income tax, but they may be subject to estate tax.

Minimizing Estate Taxes

Estate tax rates and the complexity of the estate tax system have led to a vast amount of support services to assist individuals with perceived eligibility for the estate tax to minimize their required payment. There are a number of estate planning methods that are used to minimize the federal taxes on one's estate. The marital deduction can be used to transfer any amount of assets to a spouse without being faced with gift or estate taxes. However, marital deductions may increase the total combined federal estate tax liability of the spouses upon the death of the surviving spouse. An AB trust can be used to avoid this issue, as this instrument combines the tax exemption limits for a husband and wife and gives the couple the advantages of the marital deduction while utilizing the applicable credit to its maximum.

Another method is giving away assets during one's lifetime rather than waiting until death to transfer such assets. Federal tax law allows individuals to give up to a certain amount every year to any other individual, subject to certain restrictions, without paying gift taxes. In this way, a portion of one's wealth can be transferred to others prior to death with no tax payments required. Charitable gifts are frequently discussed when covering the issue of estate planning. Charitable gifts are not taxed provided that the contribution is made to an organization that operates for religious, charitable, or educational purposes, and is viewed as eligible by the Internal Revenue Service. Estate tax deductions are given for donations to qualifying charities.

Life insurance trusts are another instrument to minimize federal estate taxes. Life insurance trusts can be designed to keep the proceeds of a life insurance policy out of one's estate and also provide one's estate with liquid assets. A life insurance trust can generally be funded by transferring an existing life insurance policy, which may have tax consequences, or by having the trust purchase a new insurance policy. The life insurance trust must be irrevocable in order to avoid inclusion in one's estate.

Estate Tax

The estate tax is a tax on one's right to transfer property at death and is paid on the contents of the deceased person's taxable estate. The U.S. federal government taxes wealth transfers through its unified gift and estate tax system, which is composed of two parts: an estate tax and a gift tax. Whereas the estate tax is imposed on the transfer of property after death, the gift tax applies to transfers of wealth between living persons. The U.S. Congress has created uniform tax rates for gifts and estate transfers of wealth, but different tax credits have been provided for gift and estate taxes since 2002. The U.S. federal estate tax

applies to every decedent who is a citizen or resident of the United States. Most individuals have heard of the estate tax, but many do not understand this death-related concept. This entry includes discussions of the estate tax in the United States, the history of the U.S. estate tax, the ongoing debate regarding estate taxes, and information on estate taxes in the international arena.

To calculate the estate tax, the gross estate is first calculated by adding the fair market value of all assets owned and interests in assets at the date of death, including cash and securities, real estate, insurance, trusts, annuities, business interests, and other assets. Second, certain deductions are allowed to arrive at the taxable estate, including mortgages, other debts, estate administration expenses, and property that passes to surviving spouses or qualified charities. Third, after the net amount is computed, the value of lifetime taxable gifts is added, and the tax is computed based on this number. The tax is reduced by several credits, including the available unified credit, which provides an exempted value with respect to the sum of the taxable estate and lifetime taxable gifts. If the estate includes property that was inherited within the previous years, and estate taxes were paid on that property, a credit may also apply.

In addition to the estate tax imposed by the federal government, some states also have an estate tax, with the state versions sometimes called an inheritance tax. Some states "piggyback" on the federal estate tax law—that is, estates exempt from federal taxation are also exempt from state taxation—whereas other states operate estate taxes independently of federal law, and estates may be subject to state tax but exempt from federal tax.

History of the Estate Tax

Historically, the federal government did not rely on such transfer taxes as a permanent source of revenue but as temporary sources of revenue during national emergencies, and the tax was generally repealed after the emergency had passed. The first transfer tax in the United States was enacted at the end of the 18th century when the nation was forced to develop a powerful navy as a result of strained trade relations with France. This led to the Stamp Act of 1797, which required the purchase of federal tax stamps when transferring property from an estate. This tax was repealed in 1802. Over 100 years later, in 1916, the Revenue Act passed, which created both the income tax and estate tax, and the gift tax was implemented in 1924 to prevent avoidance of the estate tax.

The federal transfer tax system was modified in a series of legislation passed in 1976, 1981, and 1986. Portions of the separate estate and gift tax systems were unified, marginal transfer tax rates were reduced, and filing requirements were increased, which resulted in a reduced number of transfer tax returns filed each year. Some of the changes made in this series of legislation were partially reversed in 1987 and 1992, reinstating the two top marginal rates on transfers. The estate tax was temporarily phased out by the 2001 Economic Growth and Tax Relief Reconciliation Act, with the estate tax rates set to return to the pre-act rates in 2011.

Estate Tax Debate

The estate tax continues to be an issue of heated debate. Proponents argue that federal government needs the revenue and that the estate tax provides a better source of revenue than the income tax. This is because the income tax is believed to provide disincentives to work, as it does not tax money that the individual spends, but that which is given away for noncharitable purposes. Supporters of the estate tax also argue that it helps to prevent the continuing passage of wealth in families, free of tax, contending that the estate affects only the top percentage of the wealth distribution and provides a number of credits that allow even large estates to escape taxation. Advocates of the estate tax also argue that it encourages charitable giving, as this is one way for individuals to avoid paying the tax, and according to a Congressional Budget Office Report released in 2004, eliminating the estate tax would reduce charitable giving by 6% to 12%. Supporters have also argued that the estate tax lessens income inequality.

Opponents of the estate tax argue that the tax obligation may overshadow more fundamental decisions about an individual's assets, possibly providing a disincentive to make wise investments. In addition, not all individuals have equal access to estate planning services, which may create an unequal tax burden. Research has shown that the estate tax may act as a disincentive toward

entrepreneurship and also imposes a large compliance burden on the U.S. economy, while being one of the most inefficient revenue sources. In addition, the burden of the tax falls on those receiving the property transfer, and the distributional effect of the estate tax is uncertain, as it is unknown whether the recipient is wealthy or poor.

International Estate Taxes

Many nations have lower tax rates on estates or inheritances than does the United States, which has the third highest estate tax rate in the world, following Japan and South Korea. Several countries, including Australia, Canada, China, India, and Mexico, do not have an estate or inheritance tax. The inheritance or estate tax is common in Europe, and in some nations, including Germany and France, surviving spouses are required to pay taxes on the deceased spouse's estate over a certain amount. In international tax law, the estate tax and inheritance tax are different, although this difference is not always respected, as the estate tax is a tax on the personal representatives of the estate, whereas the inheritance tax is a tax on the beneficiaries of the estate.

Eulogy

A eulogy is a specialized form of public address that occurs within ceremonies and rituals held in honor of the recently deceased. Eulogies are important because they initiate the grief process of mourners. In so doing, they provide a variety of connections between the deceased and the survivors. The eulogy also often reveals as much about the eulogist as it does about the eulogized.

Marking the passing of a loved and appreciated person by way of a public speech within funeral and memorial services occurs in every civilized contemporary culture. Though a time-honored and widely accepted practice, popular and scholarly understanding of a eulogy's purposes and components continues to evolve. Once recognized as existing to praise and memorialize the deceased, eulogies now console both the audience and presenters.

History of Funeral Oration

Many societies across various eras have invoked rituals such as funerals to respond to the great mystery, fear, and awe that surround death and dying. While the majority of rituals pertain to handling and disposition of physical remains, ceremonial features are also prominent in the earliest stages of grieving. For over 100,000 years, death practices that include religious ceremony and oration have been created to inspire the passage of the soul into another spiritual realm. Burial sites from the Neanderthal period, located near present-day Iraq, yield tools and supplies indicating that the dead were equipped with such items for the journey into an afterlife.

The ancient Egyptians meticulously prepared corpses to ensure that the souls of the dead would pass on to the next world. Though much of the associated treatment such as embalming and mummification was physical in nature, language played a role via inscriptions on amulets and inside tombs. Funeral ceremonies commonly invoked nonverbal gestures, dances of grief, and incantations such as the Opening of the Mouth, designed to revive the deceased's senses for future use.

The term *eulogy* is derived from the Latin and Greek *eulogia*, meaning well speaking or giving of high praise. Predating the birth of Christ by at least 4 centuries, the Greeks celebrated a ceremony of public burial and funeral oration. The citizens of the city-state of Athens, recognizing those who had died in battle, expressed gratitude in the form of laudation within the funeral oratory. In his "Orations Against Leptines," Demosthenes noted

that the Athenians uniquely offered funeral orations to glorify brave men and their actions. In the Menexenus, Plato detailed the structure of the funeral oration form referred to as epitaphioi; he reviewed eulogizing of the dead, exhortation of their values, and consolation of their survivors. Political agendas have also been identified within Athenian funeral oratory. For example, *epaino* (praise of the city) was offered, as was idealization of democracy.

The ancient Romans also infused funeral oratory with memorialization as well as social and political advocacy. After funeral rituals, a relative of the deceased would recite his values, accomplishments, and service to Rome so as to honor the individual, the family, and the state. In so doing, the orator also endorsed a model of virtuous living. Though no direct record of Mark Antony's funeral oration for Julius Caesar exists, it is understood to have inspired mob activity that forced Caesar's slayers into exile.

Several other cultures developed symbolic acts and practices to accompany their death rituals. Until around 100 B.C.E., European Celtic funerals featured banquets and processions, including the hurling of spears into a grave. The Norse and Viking people grieved the elite by entombing them in their ships and casting them aflame. In the Eastern world, young Hindu widows joined the funeral pyre as it burned for their husbands. Japanese mourners would bathe to cleanse them of death's taint. In North America, the Maya painted comical and traditional figures on pottery to be buried with the dead. In South America, the Incas created huge mountainside tombs and elaborate ceremonies to honor both higher-class nobility and children sacrificed for the communal good.

The duration of stately funerals was enlongated during the Middle Ages as the death of royalty meant long and frequent Christian masses, multiple burials, and new reigns that demanded ceremonial inception. Sermons delivered during funerals supplemented memorialization with biblical representations of death and exhortation of prayer and assistance toward the dead's attainment of heaven. Also, with the enhanced need for funerals as determined by the ravages of plague and war, two eulogistic features developed. Standardized sermons were in use, though they could be adapted for the characteristics of a particular decedent and according to one's social status. Inevitably, survivors were encouraged to manage, rather than succumb to, their grief.

The Renaissance and Enlightenment eras brought various controversies, including the extent to which burials, funerals, and eulogies were religious versus civic or secular entities. By the 17th century, Protestant and Catholic positions on funeral sermons had settled roughly on a combination of scripture, allusion to brief life as opposed to extended afterlife, encouragement to live and die morally, and what was becoming the substance of the eulogy, a revisiting of personal details. During the ensuing centuries, especially in Western Europe, religious contributions to eulogistic texts moved from threats of hell for immoral lives to promises of heaven for those who lived a righteous life. Concurrently, emphasis on the individual at the expense of religious dogma continued to evolve, though slowly.

Throughout the 20th century the profession and industry of the funeral was affected by several societal developments. War and atrocity wrought ever more death even as life expectancy increases distanced most developed world citizens from their own perceptions of mortality. Also, a creeping secularism lessened belief in an afterlife and provided a sense of death as outright termination rather than mere expiration of the deceased's soul. The comforts and conveniences of modern life may also be said to have collectively inflated individual awareness and perceived self-importance to the extent that death became viewed as more atrocious and unfathomable than ever before. Although grief was acceptable, it was expected to be managed over a certain amount of time and with quiet dignity. Thus, extended periods of mourning created social awkwardness or stigma. And though death itself is a more prominent topic in popular culture, the associated marginalization of death-related rituals has inspired the funeral industry to adopt appropriate staging, cosmetic practices, and euphemistic language such as "resting place" and "at peace" that further shield survivors from the reality of death.

Contemporary Eulogy Characteristics

Memorial services and funerals largely continue to feature traditional religious components, but in an

era of both lower extent of religiosity in the general population and huge evangelical congregations, clergy that deliver eulogies are less likely to personally know the deceased. Family members and friends are increasingly called upon to provide details to clergy or to perform eulogies themselves. With greater diversity in eulogizers has come more variety in format and content of eulogies, including personal reminiscence, popular poetry, recitations of the deceased's creative endeavors, and musical selections. Nonetheless, scholars have observed some trends in the content of the contemporary eulogy.

As in years past, modern eulogists seek to honor, if not worship the dead, with the provision of effusive praise. In remembrance of his sister, Diana, Princess of Wales, Earl Charles Spencer labeled her "the very essence of compassion, of duty, of style, of beauty," and someone who was "a symbol of selfless humanity, a standard bearer for the rights of the truly downtrodden." Stanley Dance called Duke Ellington "a beloved friend" and "a genius of the rarest kind." Adlai Stevenson even compared Eleanor Roosevelt's public derision as a do-gooder to that of "another public figure 1,962 years ago."

Contemporary eulogists often say goodbye, indicate their love, and promise to remember the deceased. In his eulogy for the crew of the space shuttle *Challenger*, President Ronald Reagan said, "Dick, Mike, Judy, El, Ron, Greg, and Christa—your families and your country mourn your passing. We bid you goodbye. We will never forget you." The former prime minister of Canada, Pierre Trudeau, was endearingly dismissed by his son Justin, "Je t'aime Papa."

More than the attempts to secure an afterlife as witnessed in eulogies of past generations, 20th-century eulogists are more likely to include assumptions of the deceased's existence in an afterlife. Noa Ben Artzi-Filosof asked "the angels of heaven that are accompanying you now" to watch over and guard her grandfather, the assassinated prime minister of Israel, Yitzhak Rabin. Diane Sawyer knew that there was "laughter in heaven" with the ascension of Lucille Ball, and President George W. Bush told the world that one of the astronauts from the space shuttle *Columbia* knew that if he died on the mission, he would be "just going on higher."

The deceased are often represented as living on not in heaven but in the hearts and minds of their survivors. President Lyndon Johnson remarked that President "John Fitzgerald Kennedy lives on in the immortal words and works that he left behind." Schoolteacher Jeanette O'Day's son Alan told his audience that "when you miss her and you remember how much she touched you, she will live on. When you are merciful to an injured animal, when you teach peace and tolerance to a child, she will live on."

One underappreciated aspect of the modern eulogy is its consolatory nature. Though it may be temporary, some relief from grief for the bereaved is provided when eulogizers offer a reappraisal of the loss of the deceased. The distressing event is reconceptualized so as to be somewhat more acceptable. One way of providing a more positive perspective is to acknowledge gratitude for the times enjoyed with, and lessons learned from, the eulogized. President Bill Clinton asked us to "thank God today for the lives, the character and courage of the crew of the USS *Cole*." And of Mahatma Mohandas Gandhi, Jawaharlal Nehru said, "that light represented the living truth, the eternal truths, reminding us of the right path, drawing us from error."

Positive reappraisal of death may be presented simply as recognition of a life well-lived. Senator Edward Kennedy appreciated that his nephew John F. Kennedy Jr. "for a thousand days was a husband who adored the wife who became his perfect soulmate . . . he found his shining star." Frank Oz's entire eulogy for Jim Henson portrayed the muppeteer's unique ability to intensely appreciate his own work and its rewards.

Those in attendance at eulogies are often offered consolation in the form of opportunities to break the paralysis of grief by actually doing something good. A prayer and memorial service at Yankee Stadium after the attacks on the World Trade Center featured Reverend Calvin Butts, who urged, "Get back on the airplanes! Go back to work! Rebuild America!" Both presidents who eulogized the astronauts lost to space shuttle explosions urged the space program be continued in their honor. Earl Charles Spencer implored the British public to subject Princess Diana's sons to less intense media scrutiny than that which exasperated their mother. Indeed, the social and

political advocacy of ancient eulogists is sometimes echoed by their contemporary counterparts. One obvious context in which this occurs is the funeral and services for the famously assassinated. Eulogies offered for President John F. Kennedy, civil rights leader Martin Luther King Jr., Senator Robert Kennedy, and others called for the continuation of their causes and beliefs.

Eulogists may also work to repair their own grief by voicing their strong emotions at the loss of the deceased. Two days after the assassination of President Kennedy, Chief Justice Earl Warren admitted that "we are saddened; we are stunned; we are perplexed." Archbishop Desmond Tutu was "struck numb with disbelief" and grief and "groan(ed) with anguish" at the news of Stephen Biko's death.

In sum, contemporary eulogies exist as much for the benefit of survivors as they do to dedicate the memory of the deceased.

EUTHANASIA

Practices of euthanasia have been found throughout the cultures of the ancient Greeks, Greco-Romans, Judeo-Christians, and early modern times to the present-day developed world. A common form of euthanasia is traced to the Greek roots *eu* (good) and *thanatos* (death), which have been variously rendered over the centuries as "heroic death," "noble death," and "good death." The idea of a "good death" as painless, peaceful, dignified, and within the control of the dying individual has played a central role in both the reception and understanding of the practices of euthanasia in the contemporary United States and other developed nations. The main antecedents of the medical-moral-legal context for contemporary understandings of euthanasia are discussed in this entry, followed by a review of modern controversies.

Ancient Greek and Greco-Roman Worlds

Ancient Greek attitudes toward death evolved with conceptions of euthanasia as a good death. Homeric heroes are depicted accepting death as an unavoidable evil. Acceptance of battlefield death was a fact of heroic life, and the resignation toward death the highest expression of respect for heroic values. Concerned with his own glory, the hero abjured shame and met his fate in a good death, which was essential to his fame. Heroic death gave no place to doctors to assist the dying in their last moments, and no confirmation of death was necessary, for the hero died his own good death. The essential component of euthanasia in the hero's attitude toward the evil of death was his modeling of a good death crowning a good life.

Death in the age of the Greek city-state acquired a social significance for the commonwealth, which glorified individual solidarity in defense of the

state, and associated such nobility in dying for a greater good with heroic recognition and honor. Cooperative virtues supplanted competitive virtues of the older Homeric society. For a life of happiness lived in a flourishing city-state, the ultimate individual contribution to the well-being of the polis was to have sacrificed life in its name. Euthanasia, thereby, elevated the merits of citizenship and overshadowed the demerits of the individual in the golden age of community values exemplified by the city-state.

Medicine held a prominent place among cultural achievements in the era of city-states, with the influence of the Hippocratic school often memorialized in modern times. Characteristic of the Hippocratic attitude toward sickness and death was the orientation toward enumerating various etiologies of diseases via observation of symptoms of patients. Employing rational explanation to discern the causes of sickness distinguished these doctors as forebears of practitioners of scientific methods and principled investigation in the acquisition of knowledge of humanity. The Hippocratic practitioner, however, seems to have played little if no part in attempting to relieve the suffering of those who were fatally ill. Concern for the indicators of death was primarily pragmatic in that the doctor could prognosticate death and factor this into a decision of whether to accept a patient who was beyond the help of the medical art's limited resources.

Palliative care, in the modern sense of ensuring a gentle death, was not emphasized in ancient medicine. Nevertheless, contemporary medicine's appeal to a Hippocratic injunction to doctors to not give lethal potions to patients even if requested by patients is commonly referenced in discussions of euthanasia. This idea may be an inaccurate gloss of one school's code of conduct, whose actual context and concern was to ward off a criminal role for the doctor in the surreptitious killing of a patient at another's request (e.g., a family member's request). Even so, the Hippocratic school was only one of among many much more naturalistically oriented schools whose practitioners were less reluctant to assist those individuals who had already chosen a good death in suicide.

Attitudes toward death and practices of euthanasia under conditions of Hellenistic expansion and Roman imperialism became increasingly complex during the evolution of an increasingly cosmopolitan world. The major philosophical schools of Stoicism and Epicureanism exhibited cultural tensions common to various interpretations of death and euthanasia while also prefiguring elements of contemporary debates. Stoicism embraced a conception of the individual as world citizen where wisdom dictated acceptance of the natural vicissitudes of life, including facing sickness and death with firm resolve and moral perfection. Both Greek and Roman variants of this attitude toward life and death undergirded subsequent Christian views.

Epicureanism elaborated on pre-Christian conceptions of the nullity of death and the centrality to life of "hedonism" understood as a life of good quality. Largely antithetical to Christian belief, this view held that death was simply one of many natural changes undergone by all individuals, did not necessarily entail pain or suffering, and was acknowledged as the terminus of individual existence. Postponement of life's enjoyments was pointless, and longing for death was considered an unnatural preoccupation that bred common, if irrational, anxieties best denied by striving for the unperturbed life. *Carpe diem,* an attitude of "grasping the moment," entailed enjoying life to the fullest despite personal extinguishment in death. This Epicurean attitude can be traced in contemporary secular debates over euthanasia, particularly in the case of physician-assisted suicide.

Voluntary self-killing, thought to be permitted and sometimes glorified, especially among the Romans, was also an object of doubt and rejection. For example, the Pythagorean dualistic view of human nature held that the soul was ruptured from the body through the violence of suicide. Rather, the release of the divine element of the soul from embodiment through wisdom was counseled. The Epicurean naturalistic view of human nature recognized a fundamental right of individuals to dispose of their own lives as integral to their quality of life. Alternately, the emphasis was placed on the gravity of judiciously electing the final act of volition. Such ambivalence toward suicide made for a cautious approach to this form of euthanasia. Voluntariness and principled preparation were the hallmarks of this good death as exemplified in death by hemlock in the cases of both Socrates and Seneca. There is some evidence for the presence of a doctor as procurer of the poison at Seneca's request. Information as to the doctor's affiliation

with a school of medicine, in particular, the Hippocratic school, is lacking. What does not appear to be in doubt is that the assistance of doctors at the deaths of individuals who had chosen euthanasia in the form of suicide was not uncommon.

Judeo-Christian Legacies

Stoic and Pythagorean attitudes toward suicide became more entrenched in early Christian doctrines, for example, in the works of Augustine, who writes of self-murder as an affront to God. The theological basis for the sins of murder and self-murder was explicitly formulated by Thomas Aquinas in his Christianized natural law ethics derived from Aristotle. On this view, God created all things, and it was God's prerogative to both give and take human life according to a plan of redemption. The natural good of humanity consisted in (among other goods) respecting and facilitating the inclination toward self-preservation. Choosing euthanasia in the form of suicide usurped Divine authority and for most of church history, self-murderers were banished from burial in consecrated ground; this banishment symbolized their loss of a chance for salvation in the afterlife. The only "good death" was a God-given death ideally after a good Christian life oriented toward the last judgment. The Christian doctor was not to assist in suicide and to refrain from euthanasia, now narrowly circumscribed as murder of the patient. The doctor's role became associated with palliation of the death of the patient and provision of comfort to the patient's family in following the example of Christ Healer.

The medieval Jewish tradition, personified by Maimonides, provides a rich source for attitudes toward death and the physician's role in caring for patients and facilitating a "good death" in a God-centered world. On the Hebrew view, the Creator so loved the world that he created human beings in his image and, therefore, to destroy or damage any human being offended God and diminished creation. The importance of this for physicians is elaborated in Maimonides' prayer as follows: The doctor has been chosen by God in his mercy to serve him in caring for the life, health, and death of his creatures; the doctor prays for inspiration from God to deepen his love for his calling and for God's creatures so that all three parties will be well served; the patient's disease is a gift from God foreboding danger and counseling the doctor's wisdom to avert it; and, lastly, the doctor specifically prays to remove from his patients all those who would interfere with and frustrate the medical art even to the point of often leading God's creatures to their deaths.

Both Christian and Hebrew physicians consider the practice of the art to be a vocation in the service of God and his children. Common strictures govern the physician's role in that individuals are to be cared for in health, sickness, and death and steadfastly protected from those who would undermine patients' "best interests" according to the art, namely, those third parties represented by charlatans, meddlesome relatives, and presumptuous death dealers. Suicide was no longer equated with the freedom of a "noble death" as it was with the Greco-Romans; rather, the doctor acting to assist in suicide and to cause the death of patients committed sin. While Maimonides gives no specific instruction to the doctor to refrain from providing lethal medicine, unlike the common view of Hippocrates' instruction, the Hebrew tradition would certainly have made additional instruction to the doctor redundant. The Jewish doctor is specifically enjoined, as opposed to those in the Hippocratic tradition, to give God's creatures all possible help and comfort in their last hours. The Judeo-Christian covenant with God and patients absolutely obligates the physician-servant to preside over and palliate death, neither assisting the patient's death nor causing the patient's death.

Euthanasia in the Developed World

Understanding euthanasia within this framework reveals both continuities and discontinuities with contemporary conversations about death and dying in the United States, especially when appreciated within the international context of developed Western nations. The large time segments spanning the modern period through the Enlightenment (1600–1700s) up to the Industrial Revolution including the Victorian era (1800–1920s) have more in common with earlier modes of death and dying than with conditions in the contemporary developed Western world. Judeo-Christian values pertaining to death and dying and the proscription against a role for the physician in either causing or

aiding the patient's death generally coexisted in tension with Epicurean and later secular values upholding the individual's control over the manner and timing of death by recourse to physician-assisted suicide. Increasing professionalization of medicine and early modern advances in research and therapeutics notwithstanding, death and dying did not come under the effective control of physicians until the development of highly bureaucratic institutions of medical care in recent times.

People die differently in the developed world such that what remains from the Greek senses of euthanasia are an ambivalent notion of a "good death" and the idea of a "dignified death" as an individually directed death. Developed nations, such as the United States, the Netherlands, and Germany (among several others), are all advanced industrial democracies with sophisticated medical facilities and life expectancies over 75 years of age. Populations in these societies are all characterized by an increasing proportion of older individuals. All are experiencing what has been identified as the fourth stage of the epidemiologic transition, a stage of societal development in which acute death due to infectious disease has largely been replaced by diseases that generally entail a more protracted dying process. Some estimates are as high as 70% to 80% of the population dying from degenerative diseases that are characterized by late, slow onset and extended decline. Accidents, suicide, and infectious diseases like AIDS and influenza are still causes of death in the developed world; however, most people die from cardiovascular disease, cancer, diabetes, solid organ disease, or degenerative neurological disorders. The common problem of euthanasia is how to deal with the characteristic new ways in which people die.

Euthanasia and Issues in Medical Decision Making

Advances in medicine have greatly improved possibilities to treat seriously ill patients and to prolong life. There is increasing recognition that life extension may not always be the appropriate goal of medicine, and other goals must guide medical decision making at the end of life. Medical decision making for patients with life-threatening diseases increasingly entails a balanced consideration of medical, ethical, psychosocial, and societal aspects. These considerations and the legal background in each country may modify end-of-life decision-making practices and attitudes of doctors, patients, and other people involved. In principle, end-of-life decisions include the following: whether to withhold or withdraw potentially life-prolonging treatment, for example, mechanical ventilation, tube feeding, and dialysis; whether to alleviate pain or other symptoms with, for example, opioids, benzodiazepines, or barbiturates in doses large enough to hasten death as a possible or certain side effect; and whether to consider euthanasia or physician-assisted suicide, which can be defined as the administration, prescription, or supply of drugs to end life at the patient's explicit request. End-of-life decisions take place wherever patients die, including in hospitals, nursing homes, hospices, and at home.

Accounts of end-of-life practices and associated controversies in the developed world, in particular, one by Margaret Battin, report these general findings: End-of-life decisions that are mainly a response to the suffering of patients, including alleviating pain and ending life without the explicit request of the patient, seem to be practiced everywhere in modern health care, and the frequency of end-of-life decisions that are most strongly determined by cultural factors, such as the patient's autonomy, criteria for medical futility, or legal status (euthanasia, nontreatment decisions), varies much among countries. Battin's specific research notes that there are three basic models of dying, with one of each model exemplified by the United States, the Netherlands, and Germany. She attributes the main medical, moral, and legal controversies about a "good death" in the developed world to intercultural and intracultural differences among the basic models.

Current Controversies in Euthanasia

Decisions to forgo treatment have become ubiquitous in the United States while physician-assisted suicide (PAS) and voluntary patient request for administered death remain ethically controversial and illegal (with PAS illegal in only some states). The last 2 decades of the 20th century witnessed upheavals in public consciousness about PAS, beginning with the activities of Dr. Jack Kevorkian

in Michigan during the 1990s. "Dr. Suicide," as Kevorkian became known, publicly advocated PAS and ultimately assisted in approximately 100 deaths with his "suicide machine." Controversy surrounding Kevorkian's methods pertained to his acting in isolation from the medical community, his high jury acquittal rate on charges of PAS, and his public posturing in a state that did not have laws about PAS until its legal ban of it in 1993. Kevorkian was eventually imprisoned for several years (and was released in 2007) on conviction, not of PAS, but of homicide for administering a lethal dose of medication to a patient.

If Kevorkian represents the fringe element in assisting death, then Dr. Timothy Quill represents the respectable medical community's model of a physician's role in helping patients die good deaths. Quill's advocacy of PAS comes within the context of, first, providing highly effective palliative care for dying patients, and second, considering the possibility of PAS only when the standard of care has failed and patients continue in unremitting suffering. In seeking to overturn the State of New York's ban against PAS, Quill was involved in several state court cases, which eventually led to the 1997 U.S. Supreme Court landmark decisions (*Washington v. Glucksberg* and *Vacco v. Quill*) supporting a state's right to ban PAS. Some states currently ban PAS, few states have no PAS legislation, and only the State of Oregon has legalized PAS by referendum in 1994. Amid much controversy over its initial decision, Oregon legalized PAS again in a second referendum in 1997 shortly after the U.S. Supreme Court decisions.

Practices in the Netherlands of withholding and withdrawing treatment are similar to those in the United States, but the Netherlands also permits voluntarily requested death and physician-assisted suicide. German practices prohibit any role for the physician in directly causing death given the historical legacy of Nazi euthanasia programs, but, as in other countries, withholding and withdrawing of care are widely used to avoid unwanted or inappropriate prolonging of dying patients' lives. As German physicians are also prohibited from assisting patients' deaths, such assistance is publicly sponsored by various right-to-die organizations. The qualitative arguments conclude that the problem of euthanasia is one about the choice and limits of cultures (or models of dying) and the openness to change and adaptation of various cultural practices. In seeking resolutions to the problem of euthanasia, then, the overriding need is to ensure that political debate and empirical research are continuing and productive, historically and culturally informed, and that this issue becomes more than simply an opportunity to reiterate ideological and personal differences.

EXHUMATION

Exhumation refers to the removal of human remains from their place of interment. In modern society exhumation occurs for a number of reasons, including repatriation to a different country, to change the type of disposal from inhumation to cremation, to change the location of interment, or to conform to a legal request. These types of exhumation are uncommon, particularly the latter, and are often difficult as many countries have laws

governing the disturbance of the dead. The majority of individual exhumations occur because the wishes of the deceased have been identified after inhumation has taken place. The other type of exhumation, both archaeological and forensic excavation, takes place to make way for new developments or to investigate the events surrounding ancient burial custom or modern crimes and genocides.

Exhumation in History: Politics and Grave Robbing

In historic cases, exhumation may have been facilitated by similar agendas, and examples of political and personal motivations exist where exhumation has been used to investigate, steal from, or punish the dead. Exhumation is also witnessed historically; Oliver Cromwell's body, for example, was exhumed after the reinstatement of royalty in England to facilitate his posthumous execution (Cromwell was Lord Protector of England 1653–1658 and commander of the parliamentarian forces in the civil war). Grave robbing can also be a form of exhumation, as many ancient civilizations placed valuable goods within their graves. During the New Kingdom, the ancient Egyptian ruling elite mutilated their tomb builders to prevent the location of their burial being revealed. Despite such measures and the use of protective traps and curses, many of these tombs were robbed in antiquity. This ancient tomb robbing targeted the valuable materials, but mummies were also destroyed or defaced, particularly those of controversial political figures like Akhenaten who, like Cromwell, was punished for his radical politics posthumously.

Grave robbing to acquire valuable material is a common theme in the literature of past societies, both in favor of the heroic act and warning against it because of magical or mystical defenses. This is seen in the story surrounding the death of the king Beowulf (in the 9th-century epic poem of the same name), in which a clumsy member of his retinue awakens a sleeping dragon during his ill-advised robbery of the tomb in which it slept. The dragon is subsequently slain by Beowulf, but Beowulf, by then an old man, dies in the battle. This type of event is seen in modern mythology, and the tale of Beowulf is mirrored in J. R. R. Tolkien's classic *The Hobbit* and subsequently built upon in his trilogy *Lord of the Rings*, in which spiritual guardians, both good and evil, live in ancient tumuli.

Medieval Exhumation

In medieval Europe exhumation of wealthy individuals is well documented. Foreign wars and martial punishment often meant that people were buried quickly or away from home, and it is not unknown for the surviving family of warring or crusading knights to travel with the sole intention of exhuming bodies, or parts of bodies, and returning them to the spiritual safety of family tombs, chapels, or burial grounds, so their remains could be prayed for. The same is true of religious and political figures, especially when individuals attained sainthood and their remains became religious relics and sites of pilgrimage. Two such examples were the remains of the Venerable Bede and Thomas Becket. The body of the scholar Bede was exhumed and reinterred in Durham Cathedral around 50 years after his death in 735 C.E., after it was claimed miracles took place at his tomb. Thomas Becket was exhumed twice after his burial. He was archbishop of Canterbury, and his assassination in 1170 C.E. resulted from a long running feud with Henry II over the rights and privileges of the church. He had been a popular and successful clergyman, and his resting place became the most popular site of pilgrimage in England. In 1220 C.E., over 40 years after his canonization, Becket's remains were exhumed and reinterred within a newly constructed shrine only to be reexhumed and destroyed by the agents of Henry the VIII during the dissolution of the monasteries in the 16th century.

The Body Snatchers and the Birth of the Horror Genre

In more recent history, exhumation took on a more sinister role. In the early 19th century, rogue surgeons and resurrectionists (the illegal agents of medical schools, particularly the school in Edinburgh, Scotland) exhumed the very recently dead to allow medical students and doctors to dissect them and learn human anatomy. The need for cadavers was so acute that the agents of Edinburgh extended up to 200 miles, as far south as Sheffield,

Yorkshire. The activities of these few men and women created a widespread cultural reaction, and guard towers were constructed, night patrols mounted, and patent coffins and brick-lined grave shafts were designed to prevent the theft of a loved one's body. The movement was so well documented that Burke and Hare, two resurrectionists who took the practice further by murdering victims, have been immortalized in popular films. Similarly, Mary Shelley's *Frankenstein* is thought to have been partially influenced by Mary's experiences at her mother's tomb in Old St. Pancras churchyard, a notorious haunt for the London resurrectionists. Her mother, Mary Wollstonecraft, was exhumed and moved to Bournemouth to be buried with her daughter.

Frankenstein is regarded as being the first work of horror, and the influence of resurrectionists or body snatchers can be seen throughout this genre. Exhumation was not limited to Britain but was practiced also in 19th-century America, Canada, and France, particularly Paris, for much the same reasons, although it does not seem to have been as well organized or orchestrated as it was in Britain.

Modern Exhumation: Archaeological Excavation and Forensic Investigation

In many European countries, exhumation takes place after a set period of time to move the remains to an ossuary and allow the burial space to be reused. This strategy is the direct result of the increasing need for burial space in heavily populated areas and is a contemporary cemetery management strategy. Other societies utilized disposal rites involving double burial, in which a body is exhumed and reburied in a second funeral rite. Examples of these societies include rural Greek Orthodox communities. Not all contemporary exhumation is cultural or even legal; though rare, bodysnatching continues, sometimes with political motivations. In 2004, the remains of Gladys Hammond, a farmworker's mother-in-law, were stolen from a churchyard by animal rights campaigners protesting the guinea pig–breeding program on the farm.

Mass Exhumation
